LEGISLATIVE ISSUE

Endorsed by Med Chi
for Maryland Physicians

©1990 Medical Mutual Liability Insurance Society of Maryland. All rights reserved.

It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

Quality Service to Our Physicians and Patients!

At MetPath, the reason we set the highest standards for ourselves is simple:

Our Clients Put Us To The Test Everyday.

When you're put to the test millions of times a year, you have to be the best. Our skilled laboratory professionals use the latest technology, instrumentation and methodologies to provide the most accurate results. And we constantly strive to improve our service through continuing employee education and stringent quality assurance programs. In fact, our broad experience and attention to detail has helped us earn an exceptional proficiency rating — just what clients expect

when accuracy is critical. And while technology and quality assurance programs are important in our business, the most essential element at MetPath is our people. Each employee is committed to providing the very best service. As our client, you can rely on our employees to meet the constantly changing needs of your practice. For accuracy, experience, dedication, and the highest standards in the industry, MetPath comes through time and again.

Put us to the test and see for yourself.

Legislative preview: An overview of legislative issues affecting Maryland medicine in 199225

Gerard E. Evans, Esq.

During the 1992 legislative session in Maryland, medicine will face a variety of issues, some old and familiar, and others that bring new challenges.

Providers with HIV/AIDS — A new dilemma31

Katherine Karker-Jennings, Esq. and Michael F. Berkey, Esq.

Recently, a great deal of attention has been focused on health care providers who have or may have the human immunodeficiency virus or, as it is known in its later stages, acquired immunodeficiency syndrome. This article explores some of the duties physicians have, or soon may have, to their patients and employers in the areas of testing, disclosure, and practice restraints.

Medical
and Chirurgical Faculty
of Maryland

Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

Maryland General-Bryn Mawr Rehab Center.
We're the new team in town with lots of experience.

Best of pork

3-oz. cooked serving
of pork tenderloin

Today's Pork: Compare it to chicken for a healthy surprise

You may not have considered pork to be a healthy choice for your patients on fat-modified diets. But today's fresh pork compares surprisingly well to chicken in total fat, saturated fat, cholesterol, and calories.^{1,2*}

New study: Pork is now 31% leaner

Pork is leaner today because of significant changes made in breeding and feeding techniques.¹ According to a new study conducted in cooperation with the USDA, fresh pork contains an average of 31% less fat after cooking and trimming than the same cuts reported in 1983.¹

Today's pork fits well within the dietary guidelines recommended by both the American Heart Association and the National Cholesterol Education Program. Here's some advice to help patients on low-fat diets enjoy the variety, extra taste, and versatility of pork:

- Choose the leanest cuts. Shop for cuts with "loin" in the name.
- Trim away any visible fat.
- Keep portions moderate (about 3 oz, cooked).
- Prepare by broiling or roasting, and avoid additional fat in preparation.

A safe treatment for hyperemesis gravidarum?

In the September *MMJ*, Dr. Trachtenberg described a "simple and safe treatment regimen" for hyperemesis gravidarum. He describes a case in which the multiple episodes of hyperemesis gravidarum were treated with lorazepam with apparently good outcome.

Upon my review of the *Physicians' Desk Reference*, I note the warning in large capital letters, "Lorazepam may cause fetal damage when administered to pregnant women," and subsequently the statement, "Lorazepam injection should not be used during pregnancy."

Given today's litigious climate, I would caution physicians to be aware that this proposed treatment method is at variance with standard recommendations, at least as conveyed in the *Physicians' Desk Reference*. I would also question whether one case report can be used to determine that a treatment regimen is indeed safe.

WILLIAM D. HAKKARINEN, M.D.
Baltimore

Lorazepam during pregnancy: Another view

Dr. Hakkarinen's report of the printed *PDR* warning regarding the use of lorazepam during pregnancy is accurate and cause for concern, in terms both of our current litigious climate, and the possibility of fetal damage.

I have twice contacted the professional relations pharmacologists at Wyeth who assure me that they are aware of no reports of injury to the child of a pregnancy during which the mother has used lorazepam. Corresponding sources at Roche Laboratories however, do cite a few reports of cleft palate connected with the use of diazepam.^{1,2,3} A report in *Lancet* in 1975 found a four-fold incidence of cleft lip, with or without cleft palate, but concluded that "it is quite possible that it is simply due to chance." The most recent review I have seen appeared in the *New England Journal of Medicine* in 1983,⁴ entitled "Lack of relation of oral clefts to diazepam use during pregnancy." My own Medline search reveals no studies in the last ten years. I continue to believe that any risk to the fetus is very small, if present at all.

I would point out that a trial of lorazepam might well involve only one 1.0 mg injection; if the patient does not respond, treatment ceases. If she does, then the remainder of the medication can be given orally. Everyone would agree that, especially during the first trimester of pregnancy, any drugs are best avoided. Yet, if the attending physician feels that a trial of lorazepam might be justified by the debilitation and suffering of an individual patient, perhaps the decision to try it might be arrived at together with the patient and her family.

DAVID TRACHTENBERG, M.D.
Bethesda

Too busy to write?

Are you too busy with your medical practice to write for your peers? Then, hitch your wagon to a star as Copernicus did about 500 years ago. Living in the academically poorly oriented times of medieval Europe, he looked at the firmament and formulated revolutionary concepts of celestial mechanics to give the world a concept of infinite space. Accomplished a century before the invention of the telescope, his work was done at night with poor light and wooden instruments marked with ink. He defined the rotation of the earth on its axis; its orbit around the sun; and the variation in inclination of the earth to the ecliptic. Newton confirmed the obliquity of the ecliptic a century later.

You say "Copernicus was an astronomer who looked only at the stars." Did you know that besides being a scholar and researcher, he also was a philologist, an economist, a mathematician, and a physician? Busy as he was, he devoted much of his time to the practice of medicine on a daily basis. He was a doctor to bishops, princely advisors, and peasants.

Copernicus looked at the stars and wrote *De Revolutionibus Orbium Coelestium* but he also had time for many other pursuits. Milton probably thought of Copernicus when he composed these memorable lines in *Paradise Lost*:

In six thou seest, and what if sev'nth to these
The Planet Earth, so steadfast though she seem
Insensibly three different motions move.

We would all agree that modern medicine is a harsh taskmaster and demanding of our time, but the schedule of Copernicus would shame many of us. Yet he found time to write and share his research results with his peers.

The communication of experience and knowledge to colleagues (through case studies or literature reviews, for example), benefits the writer and the reader. The quality of care we provide to the patient is enhanced. If Copernicus could find the time to write, so can you. Share your knowledge and publish in the *Maryland Medical Journal*.

JOSEPH M. MILLER, M.D.
Timonium

Current challenges in medical practice and research*

Beginning with the second half of the 20th century, the leading causes of death in Baltimore, as elsewhere in the United States, were heart disease, cancer, stroke and other cerebrovascular diseases, and automobile accidents. Even now, predominantly in the large pockets of poverty in our affluent country, about 40,000 liveborn children die each year before their first birthday. Recently, some people have called AIDS (acquired immunodeficiency syndrome) the plague of the latter part of the 20th century. I do not share this view. In my judgment, AIDS is an important new infectious disease in which cells of the immune system are destroyed, but its spread is predominantly among people with a lifestyle characterized by promiscuous, male homosexuality and intravenous drug abuse. It cannot be regarded as a threat to the general population. It is, in my judgment, receiving disproportionate public support for medical care and research.

It also seems to me that the important health challenges of the present era in economically developed countries cannot be measured only by the leading causes of death, but must also be measured by the many conditions that contribute to the misery of the living.

Among the latter is Alzheimer's disease, in which the progressive and irreversible loss of brain function stops one from being a person, and life as a human being stops while life as a human vegetable continues for many years. According to reliable estimates, there are now about four million persons with Alzheimer's disease in the US, and the number is growing annually as the number of persons 65 years of age and older continues to increase—from over 31 million today to possibly 70 million in 40 years. The misery Alzheimer's disease causes is not in the people who develop it, because they are unaware of what is going on, but in the millions of family members related to victims of Alzheimer's disease and in the society in which those with Alzheimer's continue to live as vegetables.

Let me now mention other conditions that are important as sources of human misery rather than mortality in the US. There are millions of persons with limitations of mobility caused by osteoarthritis, so-called rheumatism, rheumatoid arthritis, and neurological conditions resulting from stroke, Alzheimer's disease and multiple sclerosis. There are millions with visual, hearing, and dental impairments. And, although many people think that infectious diseases are no longer important health problems from a numerical point of view, they disregard the important findings of the national health surveys carried out by the National Center for Health Statistics that indicate that about 60 percent of the entire U.S.

population (i.e., about 151 million people) *each year* suffer from acute respiratory illnesses of sufficient severity to put them to bed for periods of two to four days. Vaccines, for a variety of reasons, have proved ineffective in dealing with this respiratory disease problem and, in my judgment, cannot meet this challenge. I believe we need a totally different kind of research dealing with the physiologic causes of the disabling symptoms rather than with the great variety of known and unknown viruses which are the etiologic agents of these illnesses.

The historically unprecedented explosion of new knowledge that medical research has provided during the past 50 years has brought both blessings and problems. It is self-evident that the main function of medical research is to provide the knowledge for good medical practice. Even I remember the days "when medical practice was 90 percent compassion and 10 percent knowledge. Now the reverse is true. There seems to be no time left for compassion, without which the practice of medicine cannot fulfill its real function. Putting compassion back into medical practice faces all sorts of difficulties that, in my judgment, must be overcome, and can only be overcome by a reorganization of the old patterns of medical practice. These difficulties are to a large extent a consequence of the aforementioned extraordinary explosion of new knowledge and the sophisticated technologies that medical research has brought forth in recent decades and will have to continue to bring forth to meet the challenges of the many diseases that make our lives miserable... Ever greater specialization has become absolutely essential and unavoidable to bring the benefits of the knowledge brought forth by medical research to those whose very lives may depend upon it."¹

My own survival to age 84 is, in large measure, due to the new knowledge and technologies that have permitted me to have two coronary bypass procedures (1972 and 1988), that have provided the new technologies used in 1983 to bring me back to life when an extensive paralytic illness brought on life-threatening respiratory arrest and loss of consciousness, and, more recently, that have given me the knowledge that a calorically restricted diet is the best way to control my Type II diabetes.

"However, the unavoidable need for specialization has led to a great disproportion in those who choose the more highly remunerative specialties. Already in 1981, almost 90 percent of physicians in the United States were said to be specialists compared to only about 17 percent in 1931... We cannot turn back the clock to the time when individual doctors, full of compassion but with insufficient knowledge, were called upon to provide total health care for the major portion of the population. Perhaps the most important specialty for which there is now the greatest need, is the specialty that would train physicians how best to obtain, integrate, and coordinate the information that the organ-, function-, and disease-oriented specialties can contribute to the total care of the patient in the

* Part of keynote address at Academic Session for the 125th anniversary of the Sinai Hospital of Baltimore, April 27, 1991.

truly satisfying doctor-patient relationship that we should not forsake in the process of adaptation to the new situation... It is this total care physician who, more than any other specialist, will have to provide the compassion and human understanding without which the practice of medicine would lose one of its most important components... Compassion without knowledge is helpless, and knowledge without compassion is insufficient for the practice of medicine. The most important current challenge is how best to achieve these desirable objectives within a framework that meets the justifiable expectations of society for optimal human health care without reference to the ability of individuals to pay for the ever-increasing and currently almost prohibitive costs of such care... I see a need for [universal] prepaid health insurance to cover all costs of health maintenance — prevention, ambulatory, medical, [surgical], dental, optical and, when [absolutely] necessary, hospitalization... Such systems [have been] in successful operation for many years in the United States by private organizations such as the Kaiser-Permanente Group on the West Coast and the Health Insurance Group of New York, where people are insured at a cost they can afford for the total health care of the family, and where the physicians who work there full-time can make decisions and spend the necessary time with their patients without being influenced by the fee-for-service they would receive."¹

"In my view, there is also a great need for modification of the ways in which the priorities for medical research are being planned and implemented in the present era. Just as in medical practice, so in medical research, ever greater specialization has become a necessary and unavoidable way in which to achieve progress... Consequently, there is often a loss of perspective regarding the major problems that urgently call for concentrated [and coordinated] studies and the priorities that unavoidably must be established for optimal use of the funds that society can afford to supply for the medical research enterprise."¹

And what should our main goal for biomedical research be? Should it be prevention of death from life-threatening diseases that *prematurely* bring our lives to the inevitable end? At the present time, about 75 percent of the deaths in older persons in the US are caused by heart disease, cancer, and stroke. It has been estimated that eliminating deaths from heart disease would add seven years to life expectancy at age 65. If cancer were entirely eliminated as a cause of death, life expectancy at age 65 would be extended by two years, and more persons would then die of heart disease and other causes. For me, it is the misery caused in older persons by chronic heart disease, cancer, and stroke and *not* the shortening of our life span that should form the basis for the ongoing search for greater understanding and ultimate elimination of these diseases. And, as I indicated above, the greatest tragedy among older persons is the progressive, irreversible loss of normal brain function that occurs in Alzheimer's disease.

I have been saying for many years, that "the ultimate goal of biomedical research in the present era [should be] to make

it possible for all of us to live out the allotted life span [of our species] with essentially unimpaired mental and physical functions, and *to die in good health* by a sudden stopping of an essential vital function that is regulated by the so-called biological clock. This type of death has long been the good fortune of many people, who in their 80s and 90s are in good physical and mental condition, and who go to sleep one night and never wake up."¹ This is the way I would like to die — preferably while listening to soul-stirring music or reading a book. It has happened to some of my friends, why not to me?

"I believe that it is not too much to expect that one day, step by step, biomedical research will come up with the knowledge that will make this type of death possible for all. This is a big goal and like all big goals in science or any other enterprise, it must be divided into smaller pieces of action — all, however, ultimately designed to lead up to the large goal... In this respect, the most important aspect of biomedical research is categorical basic research, i.e., an entirely mission-oriented, problem-solving activity, and *not* noncategorical basic research, which is a curiosity-oriented scientific enterprise — also important, but unrelated to any specific problem. It is self-evident that progress in biomedical research is inevitably dependent on progress in many other fields of scientific endeavor, especially, in all those fields designated as life sciences, the sciences that give us ever greater understanding of the miracle that is life."¹

"But life science research is not biomedical research. The questions must be different... There are so many millions of questions to be asked, that without a properly planned division of labor, progress in problem-oriented research can be unacceptably slow... Can the tremendous amount of new, specific knowledge needed to deal with the many unsolved disease problems... best be acquired only by *good* individual scientists pursuing their own individual interests which at best can deal with only very small pieces of very large problems? Is the old academic formula of finding good men or women, giving them what they need and leaving them alone, the *only* [I emphasize only] way to deal with the large mission-oriented research problems?"¹

"There is no question that research of individual good scientists — investigator-initiated research in current parlance — has resulted in many important medical advances... I believe [however] that problem-solving biomedical research [also] needs [more than] individual [analysis and] planning for optimal [definition] of the problems (not protocols for research) and for optimal utilization of different disciplines in ongoing collaborative efforts to seek solutions. What I have in mind can also be regarded as investigator-initiated categorical basic research — not of single investigators — but of groups of [interdisciplinary] investigators who would plan together and work together in such a fashion that their work could be combined to illuminate larger segments of the total problem. Such groups of investigators for interdisciplinary planning and collaborative execution of these plans cannot be expected to arise spontaneously. Bring-

ing such groups into being, in my judgment, should be one of the important intramural and extramural activities of the many *categorical* National Institutes of Health that were created by the government to deal with specific human disease problems."¹

I am enough of an optimist to believe that, sooner or later, the many problems that are now the principal causes of human misery caused by disease will be solved by the relentless pursuit of medical research, and that with greater wisdom in acquiring and using new knowledge, we may achieve a life far better than any the human race has known before.

My optimism is in the same category as the words used by Joseph Friedenwald, the first president of the Hebrew

Hospital of Baltimore in his 1868 annual report. He said: "Whilst we have every reason to congratulate ourselves on the working of this institution up to this time, there yet remains much to be done, *but no thing which is impossible to accomplish*"² (my emphasis).

Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201-5585
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland. **MMJ** announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

If Time Is Money, LifeCard Is Worth Millions.

LifeCard electronic claims processing verifies receipt of claims within 24 hours, reduces paperwork, accelerates payments, edits claims before they leave your office, and saves you money every time you file a claim.

Whether you are already using a computer or just getting started, LifeCard can

link your office to BCBS of Maryland, BCBS of the National Capital Area, Medicare B, Maryland Medicaid, and more than 21 major commercial insurance carriers.

Join the thousands of Maryland health care professionals who are saving time and money with paperless claims handling.

Our Pictures Are Worth A Thousand Words.™

Case #18

49 y.o. female with a six month history of headache, mild bilateral temporal hemianopsia and enlargement of the feet and hands.

DIAGNOSIS: Pituitary Adenoma.

Sagittal (A) and coronal (B) MRI images demonstrate enlargement of the pituitary gland with depression of the floor of the sella turcica on the left (arrow) and superior extension into the suprasella cistern. Although the mass is in close proximity to the optic chiasm (arrowhead) there is no chiasmatic compression. The coronal MRI image obtained following Gadolinium DTPA administration (C) demonstrates a focal round 10 mm area of non-enhancement involving the central and left lateral aspect of the pituitary gland. The lesion extends to the margin of the left cavernous sinus but does not invade it.

Pituitary adenomas are slow growing, benign neoplasms of epithelial origin which arise from the adenohypophysis. Clinical presentation of pituitary adenomas depends on the size of the lesion, the presence or absence of hormonal activity, the type of hormone produced and the degree of extra-sellar extension.

Multi-planar imaging, lack of bone artifact and ability to demonstrate adjacent vascular structures make MRI an excellent technique in the assessment of pituitary adenomas. The procedure accurately documents the relationship of the mass to the optic nerves, chiasm and tracts, the sphenoid sinus, and the cavernous sinuses. In that MRI involves no ionizing radiation, it is also ideal for serial follow-up of pituitary tumors.

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and week-end hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

You work hard to gain your patients' trust and confidence. At Drs. Copeland, Hyman & Shackman, we'll help you keep it.

Drs. Copeland, Hyman & Shackman P.A.

In appreciation

The members of the Editorial Board of the *Maryland Medical Journal* are most grateful to various specialists in the Maryland medical community who graciously contribute their time and expertise to the review of manuscripts for our publication. In 1991, the following individuals assisted in *MMJ*'s review process:

Thomas E. Allen, M.D.
Mark M. Applefield, M.D.
John G. Bartlett, M.D.
William R. Bell, M.D.
Peter O. Kwiterovich, Jr., M.D.
H. Lorin Lau, M.D., M.P.H.
Martha Jane Matjasko, M.D.
Travis Meredith, M.D.
Charles A. Schiffer, M.D.

Lupus Foundation grants

The Lupus Foundation of America, Inc. (LFA) has announced the availability of application forms for the 1992 LFA Research Grant Program. Grants are made to investigators for up to two years (\$15,000 per year) to support biomedical research related to finding the cause(s) and/or cure for lupus erythematosus. Each research grant proposal will be competitively reviewed and ranked by several members of the LFA Medical Council or outside experts in the field of proposed study. This year, five grants will be awarded, with funding to begin July 1, 1992. Applications can be obtained from: Lupus Foundation of America, Inc.; Suite 180; 4 Research Place; Rockville, MD 20850-3226 (301-670-9292). Applications must be received no later than February 3, 1992.

An atmosphere of understanding

The Maryland Chapter of the Crohn's and Colitis Foundation of America (CCFA) has developed support groups for patients suffering from either of these chronic inflammatory bowel diseases. The groups are organized to serve the needs of adolescent, young, young adult, and older patients and their families. Enrollment is free. Participants continue to receive care from their personal physicians while benefiting from an atmosphere of understanding and companionship provided by others whose experiences have taught them how to cope with the stress of these illnesses.

For more information, please call CCFA, Maryland Chapter at 410-486-9501. ■

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201-5585. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references), with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately twenty-five to fifty words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to twenty in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permission: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Page proofs will be mailed to the principal or corresponding author and, if not returned by the specified date, will be considered approved as typeset. ■

Does Your Lab Have The Wrong Chemistry?

As one of the region's leading architects and interior designers of medical laboratories, Levin/Brown & Associates, Inc., can help make your lab a more productive, more rewarding place in which to work.

PLANNING FOR OUR CLIENTS FINANCIAL FUTURE

Are You Getting the Best Deal or the Only Deal from Your Malpractice Carrier

Buying medical malpractice insurance without "shopping around" can be extraordinarily expensive. You can end up paying an endorsed carrier for coverage that doesn't really fit your needs.

Clements and Company offers choices and competitive rates. As independent brokers, we're not limited to exclusives by the companies we represent. We compare policies and premiums.

We can handle all your professional and personal insurance needs.

We present you with options. Call Clements and Company today. We'll update you on companies in your area and provide a rate quote. Save yourself time and money.

Contact Mr. Patrick O'Doherty today for details and a quote.

Non-surgical treatment for even the most advanced venous ulcers.

The physicians at Vein Clinics of America have successfully treated venous leg ulcers—including advanced cases—in our offices without the use of surgical procedures.

Our two-part ambulatory treatment program includes: 1) Healing the ulcer itself by isometric compression therapy; 2) Addressing the underlying cause and preventing recurrence through injection sclerotherapy of incompetent perforating veins and refluxing varicose veins.

Rapid closing of ulcer.

The common denominator of most leg ulcers is venous pump failure with edema. Our treatment first removes the edema and heals the ulcer through the application of isometric compression bandaging. This increases venous outflow during ambulation, resulting in improved pump action at the calf muscle.

Healing occurs in three to six weeks for most patients, or longer in more advanced cases. Other advantages of this phase include immediate ambulation, rapid elimination of pain and drainage and high patient acceptance.

D.K., a 69-year-old woman with recurrent ulcer and history of skin graft failures, on initial day of treatment. Edema of ankle and inflammation clearly visible.

Effective long-term healing.

Once the ulcer has healed and other problems such as edema and dermatitis are under control, the second phase of treatment can address prevailing underlying causes. Refluxing venous trunks, tributaries and incompetent perforating veins are

eliminated by injection compression sclerotherapy, often guided by Duplex Color Ultrasound.

This selective fibrosis process improves the venous pump, resulting in long-term healing and lowered recurrence of leg ulcers.

Proven treatment program with documented results.

This treatment protocol was developed over 10 years of clinical experience, with favorable results on approximately 500 leg ulcer patients.

Many patients had previous surgery with skin grafting and vein stripping. But our two-step protocol provided more effective healing. This is because the treatment is directed at the underlying cause, the venous pump failure.

For information on how your patients can benefit from this treatment call Louis Ivey, MD, Eastern Region Medical Director at (301) 654-6633.

After 17 days of isometric dressing application, ulcer is responding.

Progressive granulation and healing of ulcer. Considerable reduction of edema in subcutaneous tissues.

Long-term follow-up, including injection therapy shows no edema or ulceration.

Seasonal Injuries Can Be Avoided

Take a moment and look at your hands. They are versatile, tough, delicate and complex. They are irreplaceable. Once damaged by injury, they may never function normally again. Seasonal injuries are quite common. Doctors and specialists are seeing severe damage to fingers with fractures and amputations from snow blowers. Never place your hand in the chamber with the snow blower blades. Always use an instrument such as a stick. The blade may rotate after it is freed even if the engine is turned off. Never drink an alcoholic beverage or use drugs before operating your equipment. You will unwittingly impair your judgement and slow your reflexes thus increasing your chance of injury. Hands are the God given extensions of your mind. For more information relating to hand and arm care and safety please contact Greater Chesapeake Hand Specialists - 296-6232.

meeting should see page 36 of this MMJ. Watch the *Maryland Medical Journal* for the preliminary program and more meeting information.

President's Regional Conference - Southern Md.

The President's Regional Conference for southern Maryland is tentatively scheduled for March 1992. Watch the Executive Director's Newsletter for more information about this conference or contact Betsy Newman, Public Relations Director, at 410-539-0872 or 1-800-492-1056.

Doctor/Lawyer/Teacher Partnership

Physicians in Baltimore City and Harford County are urgently needed to prevent drug abuse in Maryland's school children. As a physician volunteer in the Doctor/Lawyer/Teacher Partnership Against Drugs, physicians will spend a few hours of their time visiting a classroom of students and discussing the medical dangers of using drugs. Training sessions for physicians interested in participating in this program will be held on Tuesday, January 14 and Wednesday, January 22, 1992 from 6 to 8 p.m. in the Med Chi Faculty Building. All physicians who participate in this program will receive a certificate of appreciation and will be recognized during Med Chi's 1992 Annual Meeting. To volunteer or for more information, contact Betsy Newman, Public Relations Director, at 410-539-0872 or 1-800-492-1056.

Office Medical Records Booklet

The Office Medical Record: Confidentiality and Disclosure, a compendium of legal and ethical guidelines for physicians and their office staff, is now available for Med Chi physicians. The booklet, which was developed by Med Chi and the Medical Mutual Liability Insurance Society of Maryland, answers many commonly asked questions about the release, maintenance, and destruction of medical records. Med Chi members can order a free copy of this booklet by calling Med Chi's Communications Department at 410-539-0872 or 1-800-492-1056.

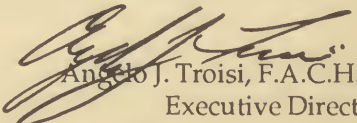

Medicare Legislation

Med Chi thanks its physicians for their hard work and efforts to encourage Maryland U.S. Representatives to support H.R. 3070 and S. 1810. Currently, 100 percent of Maryland Representatives have signed on as cosponsors of these bills which will lessen the "conversion factor" reductions proposed by the Health Care Financing Administration (HCFA).

If passed, H.R. 3070 will eliminate the 16 percent reduction in Medicare payments for physician services which was originally proposed in the Notice of Proposed Rule Making (NPRM) for the resource-based relative value scale (RBRVS) payment reform system scheduled to take effect on January 1, 1992.

According to the AMA's *Hospital Medical Staff Section Newsletter*, "S. 1810 would eliminate the cuts made to the RBRVS payments due to asymmetry and would allow a 1 percent behavioral offset reduction in reimbursements, to be divided between the conversion factor and the historical adjusted payment base. The legislation would also allow payments for electrocardiogram (EKG) interpretations, maintain the current payment methodology for drugs provided as 'incident to' a physician's services, and continue the use of time in determining payment for anesthesia services."*

Med Chi appreciates the support of its physicians and Maryland Representatives on these critical pieces of legislation and will keep Maryland physicians apprised of continuing developments with the NPRM and RBRVS and the Medicare system.

Angelo J. Troisi, F.A.C.H.E.
Executive Director

* AMA Hospital Medical Staff Section Newsletter, Volume 8, Number 11, November 1991.

TO MY PATIENTS

When I refer you to a specific health care facility for medical tests or services, you may go to that facility or any other* to have the tests or services completed. As you make this decision, I want you to know that I or members of my immediate family own a business interest in the following health care facilities:

Please feel free to ask me any questions you may have about your care. I am always interested in your continued good health.

Physician's Signature

* (unless you belong to an HMO and your plan requires that you use a particular facility.)

★ ★ ★ **IMPORTANT** ★ ★ ★

***MARYLAND LAW REGARDING NOTICE OF OWNERSHIP
OF OTHER HEALTH CARE SERVICES***

Effective July 1, 1991, Maryland law requires physicians to post a notice in their offices regarding their ownership of other health care services to which the physician refers patients. (see back)

The law, which is outlined in Section 1-206 of the Health Occupations Article of the Annotated Code of Maryland, states in part:

A health care practitioner may refer a patient or direct an employee of the practitioner to refer a patient to a health care service in which the practitioner, the practitioner's immediate family, or the practitioner in combination with the practitioner's immediate family owns a significant beneficial interest, if prior to the referral the practitioner:

- (I) Except if an oral referral is made by telephone, provides the patient with a written statement that:
 - 1. Discloses the existence of the ownership of the significant beneficial interest;
 - 2. States that the patient may choose to obtain the health care service from another provider of the health care service; and
 - 3. Requires the patient to acknowledge in writing receipt of the statement;
- (II) Except if an oral referral is made by telephone, inserts in the medical record of the patient a copy of the written acknowledgement;
- (III) Displays a written notice that is plainly visible to the patients of the practitioner disclosing all of the health care services:
 - 1. In which the practitioner, the practitioner's immediate family, or the practitioner in combination with the practitioner's immediate family owns a significant beneficial interest; and
 - 2. To which the practitioner refers patients; and
- (IV) Documents in the medical record of the patient that:
 - 1. A valid medical need exists for the referral; and
 - 2. The practitioner has disclosed the existence of the significant beneficial interest to the patient.

I am interested in serving on the following Med Chi committee(s):

Each year Med Chi requests physicians to serve on its more than 45 committees. These committees are the backbone of our organization and guide the decisions made by Med Chi's House of Delegates, Council and Executive Committee. To assure that Med Chi remains a strong and active organization, it is essential that physicians participate as active members of these committees.

As President for 1992-93, I intend to appoint as many physicians as possible to committees. Please indicate your willingness to serve by checking your preference and special interests on the attached reply card. Every effort will be made to appoint you to the committee of your choice.

Med Chi is your organization. By serving on a Med Chi committee, you can help protect and improve Maryland medicine.

Thank you for your assistance

Catastrophic Illness is Rare and the Treatment is Critical.

You know the patient. The one with chronic psychosis that hasn't responded to general inpatient care. The patient has comprehensive coverage so you've been able to admit him time and time again for inpatient care. But there's been little if any improvement, and you're frustrated. It's time to refer him to a hospital that is committed to treating the long term refractory patient and has the resources to do it. Sheppard Pratt.

Today's literature discourages long term hospitalization, and we agree. That same literature does, however acknowledge that a small group of chronic patients cannot be treated any other way. In 1984, Sheppard Pratt opened an 18 bed unit that treats only those types of patients.

We are not talking about custodial care nor do we treat patients who spend years talking about delusions. We provide long term, active, behavioral, psychopharmacological treatment for those patients who can genuinely be helped.

In addition to managing systematic and aggressive medication trials, our patients live within an established token economy. Patient education and social skills programming, and specialized activity therapy are provided daily throughout treatment. Formalized psychoeducation is also a vital component of treatment and family involvement. Comprehensive discharge planning is given attention equal to inpatient care. Sheppard Pratt provides many options for aftercare including a quarterway house, supervised housing, vocational training, outpatient therapy and medications management, and day hospitals.

Sheppard Pratt is a comprehensive network of psychiatric services. In addition to our 322 bed hospital we maintain the 16 bed Mt. Airy House, numerous community outreach programs and the National Center for Human Development. For more than 100 years, Sheppard Pratt has earned its reputation for providing quality care to the chronically ill patient. And during these difficult economic times, we remain loyal to that heritage.

For further information or to make a referral contact the Adult Admissions Office at:
(301) 938-3800

A not-for-profit health system

Stanley A. Klatsky, M.D. has been named president of the medical staff at Baltimore County General Hospital. Dr. Klatsky is an internationally recognized authority on aesthetic plastic surgery. He previously served as vice president and secretary-treasurer of the medical staff. He is currently the chief of the Division

of Plastic and Reconstructive Surgery, a position he has held since 1971.

Dr. Klatsky is past president and trustee of the American Society for Aesthetic Plastic Surgery (ASAPS) and is a member of the International Society for Aesthetic Plastic Surgery. He is the founding member and past president of the John Staige Davis Society of Plastic Surgeons of Maryland, as well as a founding member of the Northeastern Society of Plastic Surgeons. He currently serves on the American College of Surgeons' Plastic Surgery Advisory Council, and is a member of the American Society of Plastic and Reconstructive Surgeons.

A traveling professor for ASAPS, Dr. Klatsky served as co-chairperson for the First International Symposium of Aesthetic Surgery in Beijing, China. He has written extensively in numerous scientific journals and authored numerous chapters in plastic surgery textbooks.

Dr. Klatsky is an assistant professor in plastic surgery at The Johns Hopkins School of Medicine. Certified by the American Board of Plastic Surgery, he is a fellow of the American College of Surgeons and of the American Association of Plastic Surgeons. Dr. Klatsky received his plastic surgery training at the Columbia Presbyterian Medical Center in New York City.

The Maryland Society of Eye Physicians and Surgeons (MSEPS) was recently honored as a model state society by the American Academy of Ophthalmology (AAO). *George S. Malouf, Jr., M.D.*, current president of MSEPS, received this award along with eleven other state societies that excelled in organization, political and public service projects for the year 1991. Each year, the Academy recognizes state societies that have achieved a level of excellence based on a legend of model state goals established by the AAO. These goals include sponsoring significant public information projects,

increasing its membership of practicing ophthalmologists, and promoting relations between ophthalmology and the rest of medicine. MSEPS was recognized at the AAO annual meeting in October.

Morton C. Orman, M.D., an internist in private practice in Baltimore, is the author of a new book published by Breakthru Publishing. In *The 14 Day Stress Cure*, Dr. Orman describes a step-by-step approach for getting rid of stress that does not require the use of drugs, relaxation exercises, or stress management techniques. He also debunks five key myths that are widely promoted by stress management experts but that actually keep people from dealing with stress successfully.

Medical director of the Catonsville Health Center (Care-First HMO) and director of the Behavioral Medicine and Biofeedback Referral Center in Baltimore, Dr. Orman graduated from Duke University and the University of Maryland School of Medicine. Specializing in treating stress

and stress-related disorders for more than a decade, he is the author of numerous articles, books and educational programs, and is the founder of the National Health Resource Network (a national, nonprofit organization to promote humanistic competence among health professionals). Married to a veterinarian (Christine Chambreau, D.V.M.), Dr. Orman has one daughter.

J. Leonard Lichtenfeld, M.D., an internist with an interest in medical oncology, was re-elected to serve a three-year

term as a trustee of the American Society of Internal Medicine (ASIM) during the Society's 35th annual meeting.

Certified by the Board of Internal Medicine in 1977, Dr. Lichtenfeld is on the staffs of Sinai Hospital of Baltimore, The Johns Hopkins Hospital, and the Baltimore County General Hospital.

He also is an instructor at The Johns Hopkins University School of Medicine. Dr. Lichtenfeld, who is involved in utilization review and quality assurance activities at the local and state level, is on the health advisory committee for U.S. Representative Ben Cardin, (D-Baltimore) and serves on the Reference and Appeals Committee of Blue Cross and Blue Shield of Maryland. In addition, Dr. Lichtenfeld hosts a weekly radio show on WCBM in Baltimore dealing with health issues.

Dr. Lichtenfeld, who received the Maryland Society of Internal Medicine's (MSIM) Internist of the Year award in 1987, is currently president of MSIM. An active Med Chi member, he has served on several Med Chi Committees and is active in numerous community organizations. He is a fellow of the American College of Physicians.

Dr. Lichtenfeld received his undergraduate degree from the University of Pennsylvania and his medical degree from Hahnemann Medical College in Philadelphia. ■

If There is Alzheimer's Disease...

Church Home has been caring for men and women with Alzheimer's Disease since 1987 in a small and very special place we call the Broadway Wing.

The Wing is physically separate from Church Home but, like the Home, directly connected to Church Hospital. It is restful and secure. There are 22 private rooms and an enclosed garden. Nowhere in the Baltimore area is there a nursing staff better prepared—by training, experience, and temperament—for their profession.

One monthly charge covers virtually everything. There will be no hospital bills, no doctors' bills, no bills for medicines. And there is no entrance fee.

For more information or to arrange a visit to the Broadway Wing, call 732-1410.

medical
economics
A LITIGANT'S VIEW

Successfully defending a brain-damaged baby case is the courtroom equivalent of pitching a no-hitter. Because the "sympathy factor" can add millions to a jury's award, many insurance carriers would rather settle than fight.

Not so the P-I-E Mutual Insurance Co. of Cleveland, Ohio, and the 4-year-old law firm—Jacobson, Maynard, Tuschman & Kalur—that does all its defense work. In 21 brain-damaged baby cases it has defended for the last a remarkable 19-1-1, the last a hung jury. In 1988, its overall record read 34 wins, 5 losses—all malpractice cases.

There's more to those numbers than luck. "We even legal skill," adds JMT&K founding partner Aaron Jacobson, who was one of Ohio's leading plaintiffs' lawyers before he, Larry E. Rogers, Herbert S. Bell, M.D., and 70 other Cleveland doctors formed P-I-E in 1975.

"It's the concept behind the firm that makes it work. Physicians specially patch review every lawsuit to decide whether the defendant deviated significantly from the standard of care. If he did, we pay. If he didn't, we defend. Makes no difference whether it's a \$5,000 or a \$5 million case. We label it 'No pay.' That policy has resulted in a lot of cases being dropped. Perhaps more important, it's

DON'T YOU WISH THESE DEFENSE LAWYERS WERE YOURS?

This big, multistate firm rarely loses a case. But it's more than luck, or even legal skill, that's behind its enviable record.

By Howard Eisenberg

discouraged the filing of many other cases. Plaintiffs' attorneys have learned that we're fair negotiators when our doctor's in the wrong, but won't back down when he's right."

That approach pays off. "According to the most recent report I've seen from the General Accounting Office," says Larry Rogers, P-I-E president and CEO, "in 1984, about 57 percent of medical-malpractice claims were closed without payment. Through 1988, we've closed an average of 78 percent of our cases without a dime changing hands. And it's my understanding that, without including defense costs, St. Paul Fire and Marine Insurance Co.'s 1988 average gross payout for cases closed in Ohio with payment was \$52,300. Our comparable figure was about \$10,000 below

theirs. That's partly why we can sell an ORG specialty in Ohio—an industrial state that ranks among the most litigious—\$1.2 million in coverage for just \$26,400."

The unique marriage of P-I-E and JMT&K has been so successful that the carrier has expanded into five other states: Indiana, Kentucky, Maryland, Missouri, and West Virginia. Where P-I-E goes, there goes JMT&K, with nine branch offices to date. The firm has 64 trial attorneys, and may well be the nation's largest devoted well-high exclusive to medical-malpractice defense.

Could the insurer-defender symbiosis, if duplicated by other doctor companies, make a significant contribution to reducing malpractice litigation nationwide? An up-close look at

how JMT&K operates may help to answer that question.

Every lawyer develops a medical specialty

"Our firm's lawyers read more medical books than law books," says P-I-E Vice-President (and chief of counsel) Jerome S. Kalur, himself a veteran defense attorney. Robert Maynard explains, "Now cases are discussed at our weekly staff meeting, so that every lawyer is familiar with every case. But we assign cases to our attorneys according to medical specialty. They're well-versed in their fields, so they don't have to re-invent the wheel with each case." Last year, the firm's ORG specialist, attorney Jerome S. Kalur, who had won 18 consecutive brain-damaged baby cases, faced one of his toughest challenges when he defended a girl

who attempted a midforceps delivery that ended in a Caesar section and a severely brain-injured baby. Recalls Kalur, "I didn't think the doctor had caused the damage, but our position was weakened by the fact that he didn't have midforceps privileges. Based on that departure from the standard of care, our doctor panel voted to settle, and, since the hospital was also involved, a combined sum of \$1.5 million was offered. Plaintiffs turned us down flat."

"I wanted to depose the doctors who'd been involved in the mother's care during her hospitalization, but the attorney for the plaintiff baby insisted it would violate the mother's physician-patient confidentiality. That privilege would terminate automatically when her medical

The winning firm's four founders at Cleveland's 8th District Court of Appeals (from left) Jerome S. Kalur, Aaron Jacobson, James M. Tuschman, and Robert Maynard

records were introduced at the trial end of the plaintiff's case. Meanwhile, I was in the courtroom of having to tell the jury. It couldn't have been the midforceps, without offering them another reasonable brain damage theory."

Fortunately, the plaintiffs rested their case on a Friday afternoon, giving JMT&K time for a weekend rally. "Twenty minutes later," says Kalur, "I was in the hospital pathologist's office with an order permitting me to view the mother's placental slides." Maynard, Tuschman, and Kalur had been charted, and Kalur had a hunch that fetal distress had begun long before the fur-

They're seasoned attorneys with an incredible record of success.

Malpractice specialists in every medical specialty.

More than seventy lawyers in eleven offices: they're part of The P-I-E Mutual team ... Jacobson, Maynard, Tuschman & Kalur, a formidable defensive lineup, with an imposing record.

Three-quarters of all claims closed without a penny changing hands.

Ninety percent of the cases that go to trial won.

Legislative preview: An overview of legislative issues affecting Maryland medicine in 1992

Gerard E. Evans, Esquire

During the 1992 legislative session in Maryland, medicine will face a variety of issues, some old and familiar, and others that bring new challenges. The following is a list of what Med Chi can expect to encounter.

HIV protocol

In response to a request from the legislature, Med Chi developed a practice protocol for physicians with HIV which has been approved by Council. It was presented to the legislature in December. The protocol provides anonymity for infected physicians, while guaranteeing safety to the public.

Med Chi opposes mandatory testing of physicians and other health care workers, citing the Center for Disease Control (CDC) guidelines as an established and effective way to protect both patients and health care workers.

Although the public sentiment in favor of mandatory testing seems to be growing, the governor's own AIDS Advisory Council has recommended against mandatory testing of health care workers. Mandatory testing would cost several million dollars per year without any real benefit to the public.

Tobacco and alcohol use

Tobacco and alcohol use have been increasing steadily in the ranks of the young. Surgeon General Novello released a report this summer stating that eight million junior and senior high school students use alcohol weekly. In response to this trend, Novello and National Drug Control Policy Director Bob Martinez have

expanded their goals to include reducing the amount of advertising of tobacco and alcohol to young people.

Currently over four million teenagers smoke. Smoking causes more preventable illnesses than any other form of addiction. It is documented that if young people can be encouraged not to start smoking, they probably will not start when they are older. Alcohol and tobacco use are also associated with the initiation of other illicit drug use, such as marijuana and cocaine.

Med Chi favors all legislation encouraging the cessation of smoking and a reduction in the use of alcohol, especially among teenagers. With the American Lung Association, the American Cancer Society, the American Heart Association, Mothers Against Drunk Driving (MADD), and Students Against Drunk Driving (SADD), Med Chi supports these efforts.

Last year in Maryland, a bill taxing cigarettes was passed. But a bill which would have reduced access to cigarettes in vending machines by minors and one which would have prohibited smoking in public were defeated. Med Chi continues to support these bills and will work to have them resubmitted and passed. Med Chi will suggest that billboard advertisements for both alcohol and tobacco be curtailed.

Med Chi would also like to express its concern regarding the curtailing of counseling services for alcohol and drug addiction, especially at the state hospitals, which have been severely hit by the budget cuts.

Gerard E. Evans, Esquire is a partner in Rifkin, Evans, Silver and Rozner and serves as chief lobbyist in Annapolis for the Medical and Chirurgical Faculty of Maryland each legislative session.

Podiatry bill (SB 428 - 1991)

The Maryland Orthopaedic Society and the Maryland Podiatric Medical Association have again been discussing the scope of podiatry practice with Senator Paula Hollinger (D., Baltimore County - 11th district) and Senator Virginia Thomas (D., Howard County). The purpose of last year's bill was "to alter the definition of podiatry to include the capability of a licensed podiatrist to diagnose and surgically, medically, or mechanically treat any ailment of the human ankle and certain other related structures..."

This bill does not represent a turf battle as indicated by some, but rather a genuine concern regarding the quality of care provided to the citizens of Maryland.

Med Chi and the Orthopaedic Society agree that there is no necessity for a change in the scope of podiatric practice. If a bill is submitted, Med Chi will work to insure the following elements:

1. The practice of podiatry will not include administration of an anesthetic, other than a local anesthetic; arthrodesis of two or more tarsal bones; complete tarsal osteotomy, open or closed reduction of ankle fractures; ankle arthrodeses; or the repair of chronic lateral ankle instability.
2. A licensed podiatrist may only perform surgical procedures on the ankle if he/she has completed a three-year in-hospital surgical residency.
3. There will be no grandfathering of podiatrists currently practicing in the state.
4. Surgical procedures must be performed in a licensed hospital, not a free-standing center.

Med Chi and the Orthopaedic Society feel there is no need for a bill to change the scope of podiatric practice. However, if a bill is submitted, Med Chi will oppose any bill that does not include the above stated elements. The medical community understands the desire and the interest of the Podiatric

Medical Association to increase the scope of podiatric practice, but any increase must insure the current standard of care for the citizens of Maryland. Currently, most podiatrists have no hands-on postgraduate training. For the protection of the patient, it is imperative that those who provide care have completed the proper training and are qualified to perform surgical procedures. It is also essential that these procedures be performed in a hospital with ongoing quality assurance and utilization review.

Universal Health Insurance for Maryland

Senator Hollinger strongly feels that every citizen in the state should have access to medical care. She has therefore drafted legislation to create the Universal Health Insurance for Maryland (UHIM) plan, its governing structure, and its coverage. This bill would mandate a basic policy for every citizen in the state. This bill is clearly a single-payor approach to universal access. Administration of the plan would be by a Board of Governors consisting of 20 members appointed by the governor and approved by the Senate.

Non-state residents working in Maryland who pay a payroll deduction would also be eligible during any period of employment. Pre-existing conditions would not exclude eligibility.

The first ten days of inpatient hospital stay and related professional services, whether for physical or mental illness, would be covered.

Ten office visits with a licensed health care provider per year for the diagnosis and treatment of any illness or injury, including laboratory and diagnostic procedures and outpatient surgery, would also be covered, as well as reasonable prenatal and newborn child care. The policy would contain an exclusion for services that are not medically necessary or are not covered under preventive health services. The reimbursement for hospital rates would be determined by the Health Systems Cost Review Commission (HSCRC). Outpatient rates would be determined by the Board of Governors—probably based on Medicare's resource-based relative value scale (RBRVS).

To fund this program, Medicare/Medicaid would pay directly into the fund (a capitated fee plus an adjustment for nonpaying residents, i.e., the unemployed). There would also be a payroll deduction for all workers and dependents to be set by the Board of Governors, which would also include an additional adjustment for nonpaying residents. There would be a state affordability cap as set by the Board of Governors on the total amount in the fund. Providers would be prohibited from charging rates for covered services that exceed the rates set by UHIM.

No position has been taken at this time regarding this bill, but Med Chi favors the AMA's Health Access America plan as a more workable solution to the health care crisis.

There are several areas of concern regarding this bill:

- The Board of Governors is quite large (20 members), with an extraordinarily small representation of the medical providers of this state.
- Maryland has a strong existing all-payor system, so there are cogent arguments for staying with the all-payor system rather than a single-payor system for outpatient services and an all-payor system for inpatient services. There is also concern over the language regarding managed care provisions.
- Tying reimbursement to RBRVS when it has not even had a trial with Medicare seems to be very risky. Although the plan allows for the purchase of enhancement policies, it appears that fees may be capped at RBRVS levels, making the purchase of an additional policy questionable.

Fee capping issues

During the 1991 session, there was much effort to initiate studies by the HSCRC regarding the regulation of hospital-based physicians. The Maryland Chamber of Commerce was instrumental in introducing several of these bills. This year, the effort may be even stronger because the Maryland Chamber of Commerce and the Maryland Economic Growth Associates (MEGA) have merged. Former Baltimore County Executive Don Hutchinson has assumed the Chamber presidency after heading up MEGA for the past four and a half years. Mr. Hutchinson remains a powerful political figure in the Maryland arena and will definitely add clout to the Chamber's efforts.

The federal government and many insurance companies have already conducted studies indicating that Maryland physicians' fees are not above average nationally. At the federal level, regulation of physicians' fees has increased greatly in the past several years and at the local level, many hospital-based physicians' fees are regulated by contractual agreement. Considering the extent of the budget deficit, Med Chi believes another study is not warranted and that the little that might be learned from such a study would not warrant its cost.

The HSCRC exists in this state in order to prevent the loss of the diagnostic related group (DRG) waiver for Medicare and to preserve the "all-payor system," not to regulate health care providers. Also, HSCRC regulation of radiologists, anesthesiologists, and pathologists (RAPs) was overturned several years ago by the courts in a case involving Holy Cross Hospital. Greater regulation would encourage physicians

working within hospitals to move their services outside of the hospital environment, and may be even out of the state. This would affect the stability of the state's hospitals, as well as creating an access problem for patients.

Mandated Medicare Assignment

For the last five years, Delegate Pinsky (D., Prince George's County) has attempted to institute Mandated Medicare Assignment in Maryland. Last year, he introduced legislation that would prohibit any physician, not just emergency room physicians, who provides emergency medical care to Medicare beneficiaries in hospital emergency rooms in Maryland from charging any amount in excess of the charge for that service as determined by the United States Secretary for Health and Human Services.

We assume that he will again introduce legislation mandating assignment in spite of the fact that more than 88 percent of the claims filed in Maryland in 1990 were accepted on an assigned basis and 41 percent of the physicians in Maryland are now participating physicians.

Medicare fees are already controlled at the federal level through reimbursement regulations. Mandated Medicare Assignment has been strongly defeated at the federal level because federal legislators feel it is a constraint of trade and that the RBRVS will replace the current system as of January 1, 1992. This remains a federal issue not a state issue; it should be handled at the federal level.

Also, legislation passed in the 1990 Budget Reconciliation bill instituted a phase-in reduction plan for balance billing. Since September 1990, all physicians, including primary care physicians, have been required to fill out the Medicare forms for their patients.

Breast implants

Recently, in spite of much controversy and public outcry, the Food and Drug Administration (FDA) allowed breast implants to remain available to women who need breast augmentation. Although much information has been reviewed, there is no conclusive proof that implants are unsafe.

It is apparent that state legislation will be introduced to bar the use of this device. Medicine will scrutinize

closely any attempt to restrict its authority until real evidence exists about possible dangers.

As in past years, the issues affecting medicine are

many and varied. Med

Chi will be active

in Annapolis, con-

tinuing medi-

cine's struggle to

maintain and im-

prove the environ-

ment of medicine in

order to continue to give patients

the best possible care. ■

Providers with HIV/AIDS — A new dilemma

Katherine Karker-Jennings, Esq. and Michael F. Berkey, Esq.

Katherine Karker-Jennings, Esq. is the partner in charge of the health law reimbursement division in the law firm of Rifkin, Evans, Silver & Rozner, Baltimore, Maryland. Michael F. Berkey, Esq. is associate counsel for the Blue Cross and Blue Shield Association's Baltimore, Maryland, regional office.

Recently, a great deal of attention has been focused on health care providers who have or may have the human immunodeficiency virus or, as it is known in its later stages, acquired immunodeficiency syndrome. This article explores some of the duties physicians have, or soon may have, to their patients and employers in the areas of testing, disclosure, and practice restraints.

Two recent cases involving health care providers afflicted with acquired immunodeficiency syndrome (AIDS) have brought to light a new dilemma: What duties do providers owe to employers and patients with respect to testing, disclosure, and modification of medical practice when they have, or suspect they might have, AIDS?

In the first case, Mrs. Perry Rossi agreed to have Dr. Rudolph Almaraz, a surgeon at The Johns Hopkins Hospital in Baltimore, Maryland, remove a nonmalignant lump from her breast. Dr. Almaraz performed the operation in November 1989, one of the 1,800 operations he had performed since joining the hospital in 1984. The case would probably have gone unnoticed among the thousands of such operations performed nationwide each year except for one detail — Dr. Almaraz died of AIDS one year later, and only after his death did his estate and the hospital disclose the fact that Dr. Almaraz had suffered from AIDS while still performing surgery. Shortly thereafter, without yet knowing whether she had contracted the disease, Mrs. Rossi filed a \$32 million lawsuit against the hospital and the doctor's estate.¹

The second case involved Dr. David Acer, a Florida dentist who recently died of AIDS. Dr. Acer, who had continued to practice after being diagnosed with AIDS, wrote an open letter to his patients urging them to be tested for the human immunodeficiency virus (HIV) after learning that he might have infected 19-year-old Kimberly Bergalis during the extraction of her wisdom teeth in 1987. Another tragedy, another lawsuit; this one settled for \$1 million.² After subsequent testing, two more patients of Dr. Acer have turned up HIV-positive, also apparently resulting from dental procedures he performed.³

Whenever undesirable events occur, it is natural to seek their cause as the first step toward preventing their recurrence. It is also natural to place

the blame for the events on someone other than the one who has suffered the harm. This is the premise for the law of negligence, with its four familiar aspects of duty, breach, injury, and causation.

Much of the development of the law of HIV/AIDS, indeed much of the development of American tort law in general, consists of recognizing, pursuing, or creating new duties, which may then be (or already have been) breached. Duties may be established by statute, or they may simply evolve based on the changing standards of care common and accepted in a particular community, whether that be the patient community or the medical community of providers, or both.

In the first few years of the HIV/AIDS "crisis," the focus was on patients who might have the disease and whether persons in certain situations had duties to test or be tested, to disclose or warn, and to modify their behaviors or refrain from certain activities. Only recently, largely as a result of the cases of Drs. Acer and Almaraz, has the public (including providers, patients, lawyers, and legislators) begun to direct its attention to health care providers with HIV/AIDS.

It is difficult to tell whether the cases of Drs. Acer and Almaraz are symptomatic of a larger problem or merely aberrations in an otherwise safe environment. However, it has been estimated by the Centers for Disease Control (CDC) that 128 Americans have been infected with HIV by surgeons or dentists to date,⁴ and the history of the United States' response to HIV/AIDS suggests that this number will be treated as unacceptably high.

A number of complicated legal issues emerge from these two cases. For example: What obligations do providers of health care owe the patient population? What are the different interests at stake in deciding whether to mandate testing of providers for HIV infection? Would disclosure of the results of HIV testing be desirable? What changes should be made in a provider's practice when he or she is known to be infected with HIV? More questions are bound to arise in the near future, as only a rapidly discovered cure or vaccine for HIV/AIDS is likely to slow the almost frenetic pace of litigation and legislation this disease has engendered.

This article will first review the evolution of duties that have been directed at *patients*, and then focus on the potential duties of *providers*, with respect to the following three questions:

1. What is the duty to be *tested* for HIV?
2. To whom is there a duty to *disclose the results* of HIV testing?
3. To what extent is there any duty to *modify behavior* when one has tested positive for HIV?

Current duties of patients

Before debating the pros and cons of testing providers, and then further debating what to do about the test results, it is instructive to review the duties to test, to warn, and to refrain from certain high risk activities that have evolved with respect to *patients*.

Mandatory testing

Situations requiring testing or imposing a duty to test may be viewed as exceptions to the general rule that informed consent must be obtained before the individual's privacy may be invaded with a needle. As of 1990, about one-third of the states had statutory or regulatory exceptions to the informed consent doctrine, usually involving testing following potential exposure to health care workers and/or emergency medical personnel.⁵ In addition, almost one-half of the states have enacted laws that make HIV testing compulsory for prostitutes and other sex offenders.⁶

Despite the nationwide presence of informed consent laws, which generally have very limited exceptions, the trend among physicians, here and abroad, is to demand HIV testing of *all* patients being admitted to a hospital for surgical or other procedures,⁷ and, in reality, such testing may already be the normal (yet improper) practice of many hospitals.⁸ To meet the desire of hospitals and physicians to require HIV testing upon hospital admission, however, many states have begun to draft such statutes for debate in the 1991 legislative year.⁹

Permitted or required disclosure

A number of different types of notification statutes exist with respect to communication of an individual's HIV status to a third party. Ten states have legislation or regulations that allow notification to blood donors;¹⁰ 17 states allow notification to known sexual partners;¹¹ 19 states require notification to emergency medical personnel;¹² 27 states require notification to health care workers;¹³ and 17 states require notification to funeral directors.¹⁴

Compulsory behavior modification

Many states have enacted criminal and/or civil statutes to help control high risk behavior in confirmed HIV-positive individuals. In Maryland, for example, an HIV-positive individual who willfully, knowingly, and intentionally transfers or attempts to transfer the disease to another individual is guilty of a misdemeanor and can face a fine of up to \$2,500 or imprisonment for up to three years, or both.¹⁵ In California, a prostitute convicted of a second offense after previously testing positive for HIV (a test that is required upon a first conviction) is guilty of a felony.¹⁶ Similarly, Mexico recently introduced a new law calling for jail sentences of up to five years for anyone found guilty of knowingly transmitting an incurable disease through sexual contact, and up to three years for knowingly spreading a curable sexually transmitted disease.¹⁷

Potential duties of providers

Even before the cases of Drs. Acer and Almaraz were publicized, at least one author had argued that the justifications for and against screening patients and providers were "symmetrical."¹⁸ Although that may be true in theory, in practical terms, it would be difficult to implement the same

duties with respect to providers as have been imposed on patients. Providers, as a group, are more politically astute and organized than are patients, and the types of duties already imposed on patients are not easily translated into duties that can be conferred on providers.

Mandatory testing

One area where there *is* symmetry between patients and providers is mandatory testing. Thus far, mandatory testing for both patients and providers is the exception, not the rule, not because there is no need or desire to test, but because of the issue of reliability. The most common form of current testing is inconclusive, since it discloses only the antibodies produced to fight HIV, and these antibodies usually cannot be detected until at least six to fourteen weeks, and sometimes years, after infection, during which time the infected in-

dividual could have been infecting others.¹⁹ Moreover, test results are not 100 percent accurate, nor are they accurately read 100 percent of the time.²⁰ These factors combine to make reliance on antibody testing inappropriate for providers when career-sensitive decisions must be made.

More reliable is a genetic test that can detect HIV itself, but it is very expensive to perform.¹⁹ Where the need or desire to know the HIV status of providers is considered great, however, the cost of this type of testing might be justified. At some point, the determination may be made that the risk of providers transferring HIV to patients is unacceptably high, and that such alternatives as universal precautions (which are based on the assumption that either the patient or the provider already has HIV) provide insufficient protection. When that time comes, genetic testing may become a duty of the provider.

Although less expensive and more accurate tests may be developed in the future that would increase the likelihood of imposing a duty of mandatory testing on providers, especially those who perform procedures involving blood or bodily fluids, no such duty is likely to be found at this time. Meanwhile, providers may find that the fourth amendment's prohibition against unreasonable searches and seizures provides additional insulation from mandatory HIV testing. In the leading case on this subject from the perspective of health care workers, *Glover v Eastern Nebraska Community Office of Retardation*,²¹ the Eighth Circuit Court of Appeals affirmed a lower court holding that testing certain health care workers was unconstitutional. In striking down policy implemented by a facility for the mentally retarded for HIV screening of staff members where such staff members came in direct contact with patients, the lower court had said, "[t]here is simply no real basis to be concerned that clients are at risk of contracting the AIDS virus at the work place."²²

Required disclosure

Both the American Medical Association (AMA) and the American Dental Association (ADA) issued recommendations in January 1991 that urged providers infected with HIV to warn patients about their condition.²³ The CDC, which had previously recommended only voluntary disclosure to a provider's employer, was expected to issue a revision to its recommendations for providers later in the

Physicians and HIV: An update for Maryland physicians

The Maryland General Assembly addressed the problem of HIV-infected physicians and passed H.B. 124 in May 1991. This law charged the Medical and Chirurgical Faculty of Maryland (Med Chi), in consultation with the Centers for Disease Control (CDC), the Maryland Hospital Association and the Department of Health and Mental Hygiene, to develop a practice protocol for HIV-infected physicians. This protocol was passed by the Med Chi House of Delegates in September and was presented to the Maryland legislature in December 1991. (See *MMJ* 1991; 40(12): 1128-9.)

During the development of this protocol, Governor Schaefer announced in August that he was considering pursuing mandatory testing for HIV for health care workers and patients. Following this announcement, Med Chi issued a news release reaffirming its opposition to mandatory HIV testing for health care workers and patients.

Citing lack of scientific evidence for the need to test health care workers and the exorbitant increase in health care costs that would result from testing health care workers and patients, Med Chi reiterated its position in its practice protocol for HIV-infected physicians. The protocol is based, in part, on CDC guidelines which do not recommend mandatory testing for health care workers or patients. The Med Chi protocol recommends voluntary testing of physicians who perform exposure-prone invasive procedures or procedures at high-risk for transmitting HIV. If the protocol becomes Maryland law, HIV-infected physicians would report to a panel of experts who would evaluate them and set limits on their practices.

Med Chi is currently undertaking a campaign to educate physicians and the public about the real risks of HIV transmission. Part of the campaign is a series of letters to legislators providing data on HIV transmission in Maryland, as well as on the costs and potential consequences of a mandatory testing program.

At press time (November 15, 1991), no information was available regarding the governor's proposed testing program. However, Med Chi anticipates that a bill requiring mandatory testing of health care workers and patients will be introduced during the 1992 session.

"The physicians of Maryland hope legislators will consider the scientific facts when voting on any legislation relating to mandatory testing of health care workers for HIV," said Med Chi Council Chairperson Marvin Schneider, M.D. in response to Schaefer's announcement in August. "Med Chi believes that only through the application of sound medical principles will society be able to confront this disease rationally and compassionately, and thus ensure the safety and health of all our patients."

year.²³ Recommendations from such official sources are tantamount to establishing a duty to disclose HIV infection to patients, even though most patients would choose not to obtain further care from an infected provider.^{3,24}

Even without such official pronouncements, however, "hospital policy" may be sufficient to require a provider to disclose his or her HIV status to an employer hospital or face termination or loss of privileges. This principle is well illustrated by one recent case, where a nurse was encouraged by his employer hospital's infection control practitioner to have an HIV test when it came to the attention of the hospital that the nurse's roommate was an AIDS patient.²⁵ When approached by the infection control practitioner, the nurse said that he had already been tested and promised to supply the results to the hospital when they became available. In addition, he volunteered the fact that he had a draining cyst under his arm. The nurse was then told not to return to work until he was cleared by a doctor.²⁵

After the nurse received the test results, he refused to disclose them to the hospital, and the hospital, which had already learned that the nurse had tested positive for hepatitis B and had a history of syphilis, fired him.²⁵ This termination was upheld on appeal to the Fifth Circuit Court of Appeals, which held that the nurse's failure to comply with a hospital disclosure policy designed to safeguard the health of patients justified the hospital's action.²⁵ The consequences to a health care provider of disclosing an HIV-positive test result, and the court's possible reaction to termination based on this disclosure, were not discussed, but it seems likely that, if a termination decision for nondisclosure can be upheld, termination for being HIV-positive (the worst possible disclosure) would also be considered justified, even in the face of laws designed to protect the handicapped.²⁶ Court cases involving HIV/AIDS often turn on the particular facts, but it is still difficult to reconcile the Fifth Circuit's conclusion in this case with the Eighth Circuit's holding in *Glover*.^{21,22}

Compulsory behavior modification

At present, the decision whether or not to continue to practice after being diagnosed with HIV or AIDS rests solely with the health care provider. However, both the AMA and ADA recommend that providers with HIV/AIDS abandon surgery altogether unless their patients are fully informed of the provider's condition and the risks of HIV transmission, and thereafter consent to such procedures.²⁴ Although any pronouncements by such nationally recognized organizations significantly increase the likelihood that an enforceable duty to comply will be created, they are not binding. In fact, New York State health officials have specifically decided not to mandate a duty of informed consent or behavior modification by regulation, maintaining that the risk to patients from providers is too small to warrant such action, especially where precautions are taken against transmission.³

Other possible alternatives to informed consent by HIV-infected surgeons would be simply to ban certain classes of

providers, such as surgeons, from continued practice if they are HIV-positive, or to restrict the procedures that HIV-infected providers may perform, either by employing a subjective general definition of prohibited procedures or objectively listing those procedures that are forbidden.^{18,27} Providers or procedures not covered by the ban would still be subject to the informed consent duty.

Conclusion

In the past, physician rights and patient duties with respect to HIV/AIDS came under scrutiny only when the perceived danger was HIV transmission from patient to physician. Now that it is apparent from the cases of Drs. Almaraz and Acer that the transmission arrow may point in both directions, patient rights and concomitant provider duties must be analyzed.

While it is apparent that Drs. Almaraz and Acer eventually realized that they were infected with HIV, it is unclear when either doctor first became aware of his illness, and it therefore cannot be stated with any certainty that mandatory testing (even if totally accurate and conclusive) would have changed the outcome of either case. At this juncture, mainly because of the fallibility of antibody testing (and, arguably, the high cost of genetic testing), mandatory HIV testing of providers has not yet been embraced by the medical community, the legal community, or the government.

Once a provider is aware that he or she is HIV-positive, however, the more problematic issue of disclosure comes into play. Courts appear to be split over whether such a duty exists, and various state legislatures are just now beginning to grapple with the problem.

With regard to behavior modification, absent disclosure to the patient, the decision presently rests solely with the provider as to whether or not he or she will continue to perform "invasive procedures." With disclosure, the patients themselves will dictate, through informed consent (or refusal), the procedures permitted by HIV-infected providers.

 For hotel reservations call (301) 752-1100

Call for Papers

The Medical & Chirurgical Faculty of Maryland

requests papers on the theme

Mini-invasion & Megatreatments

for the
1992 Annual Meeting

at the
*Omni Inner Harbor Hotel
in Baltimore*

*Thursday, Friday, & Saturday
April 30, May 1 and 2*

Over the last few years, the use of scopes has been introduced in surgical and nonsurgical procedures for diagnosis and treatment in a wide range of medical specialties. Because scopes involve minimal incisions and very low morbidity, they are enthusiastically supported by both physicians and patients. This year, Med Chi highlights the promise of this new technology as the theme for its annual meeting: "Mini-invasion and Megatreatments."

Med Chi invites papers dealing with "Mini-invasion and Megatreatments" for consideration by Med Chi's Committee on Scientific Activity and presentation at the 1992 Med Chi Annual Meeting.

For more information call Med Chi's Office of Continuing Medical Education at 301-539-0872 or 1-800-492-1056. Deadline for submission of scientific papers is January 15, 1992.

The legislative process*

From hopper to enactment

The drafting of legislation requires the skill of experienced and trained personnel. This service is rendered by the Department of Legislative Reference. A bill or joint resolution may be introduced in advance of regular sessions and is styled a "prefiled bill." A bill is filed (is dropped into the hopper) with the secretary of the Senate or the clerk of the House, is given a number, and is readied for its first reading on the floor. Bills may be introduced in either chamber until the last 35 days of the session. After that, bills may be introduced only with the consent of two-thirds of the membership.

First reading. The reading clerk, when the session has convened, reads the title, and the presiding officer assigns the bill to the appropriate committee.

Reference to committee. The committees meet daily during the session to receive testimony and take action on bills assigned. Citizens are encouraged to present their views on the subject matter by mail or by personal appearance. Legislative agents (lobbyists), representing organized interest groups, speak at these hearings, either to oppose or support the proposed legislation. The Department of Fiscal Services prepares a fiscal analysis for each bill and these fiscal notes are considered during the committee deliberation.

Unfavorable committee action, which may mean legislative death, frequently requires as much, or more, committee discussion and time as favorable committee action, which sends the bill to the floor for second reading and floor consideration.

Second reading and floor consideration. The bill is reported to the floor by the committee (favorably, unfavorably, or without recommendation, and with or without committee amendment). It is open to amendment from the floor, and the ultimate form of the bill must be determined on second reading. Committee action may be reversed but this is infrequent.

Third reading. The bill must be printed for third reading with all amendments included in this final version. No amendments may be presented on third reading in the chamber of its origin, and the bill must be passed by a majority of the elected membership.

Second chamber. The procedure follows a pattern identical with that of the chamber in which the bill originated, except amendments may be proposed during third reading as well as second reading. If not amended in the second chamber, final passage may occur without reprinting.

Consideration of bills*

Consideration of bills originating in one chamber and amended in second chamber

If amended in the second chamber, the bill is returned to the chamber of origin where a vote is taken on a motion to concur or reject the amendments. If concurrence is voted, the bill itself is voted on as amended and action is complete. The bill is reprinted, or enrolled, to include the added amendments before submitting it to the governor.

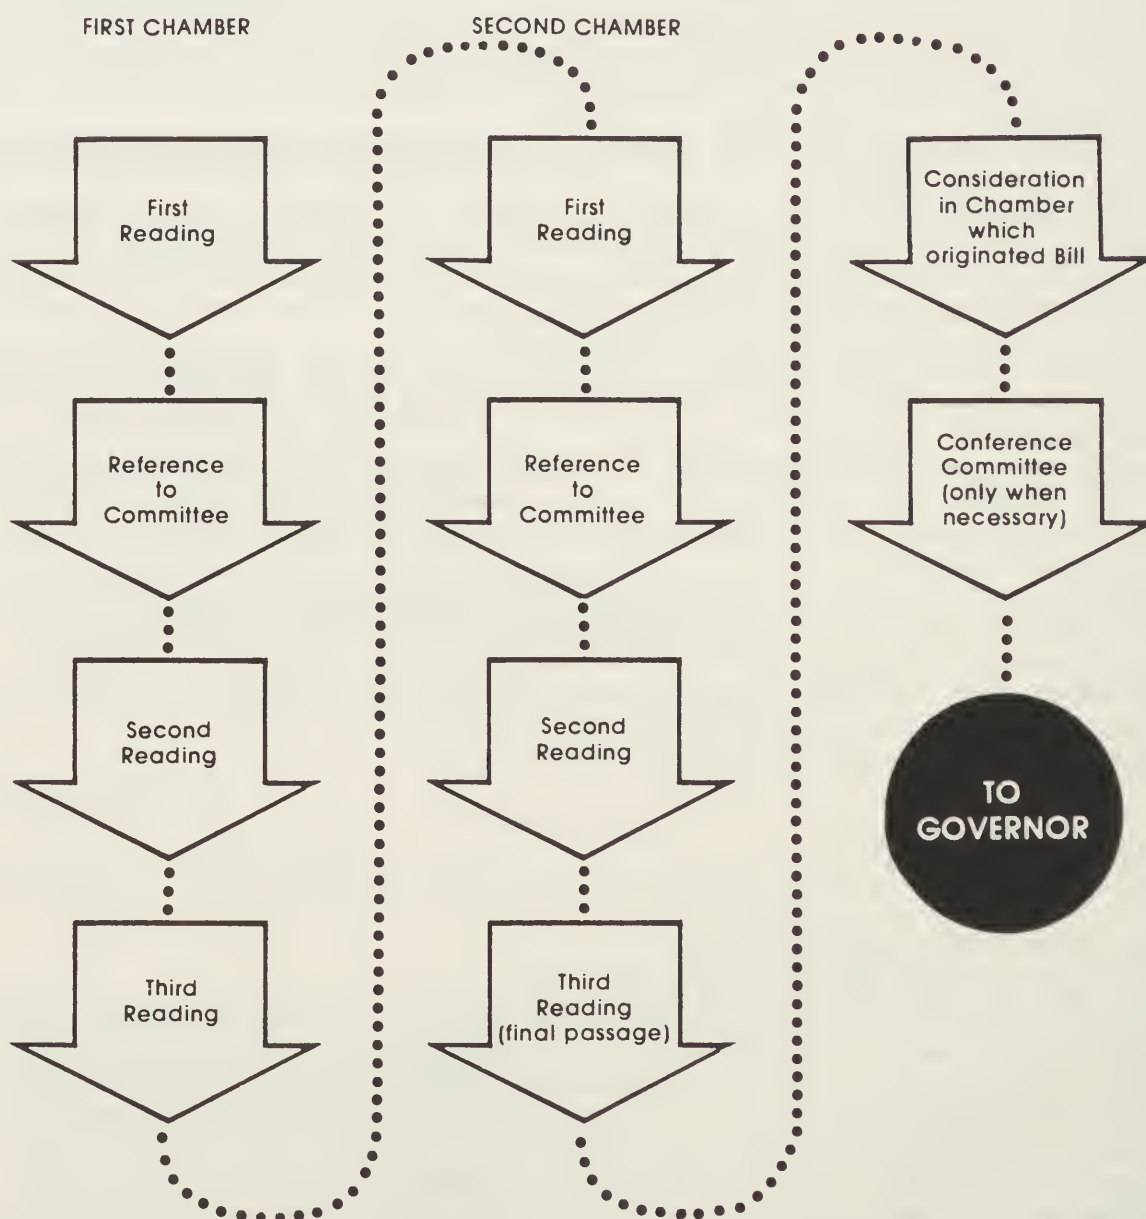

If the amendments are rejected, two courses of action are possible: (1) the amending chamber may be requested to withdraw its amendments or (2) upon refusal of withdrawal of amendments, either chamber may request a conference committee to resolve the differences between the two chambers.

Conference committee. A report of a conference committee goes back to both chambers to be adopted or rejected without amendment. If the conference committee report is adopted, the bill is voted upon for final passage in each house. If the conference committee report is rejected by either house, the bill fails.

Presentation of bills to the governor. Presentation of all bills to the governor is mandatory, except the budget bill and constitutional amendments. The budget bill becomes law upon its final passage and cannot be vetoed. Bills must be presented to the governor within 20 days following adjournment of a session, and in the case of such bills, the governor may veto within 30 days after presentation to him. If a bill is not vetoed, it becomes a law. The governor may not veto a constitutional amendment.

The power to override a veto. This power rests with the legislature. If a bill is vetoed during regular session, the veto message is considered immediately. If a bill presented after the session is vetoed, the veto message must be considered immediately at the next regular or special session of the legislature, except that the legislature may not override a veto during the first year of a new term. A three-fifths vote of the elected membership in each chamber is necessary to override a veto.

The progress of a bill*

* Information for this and the preceding page was provided by the State of Maryland Department of Legislative Reference, F. Carvel Payne, Director.

The 1992 Maryland General Assembly — Dates of interest

January 8	Session convenes.
January 15	Budget must be submitted by governor prior to this date.
January 21	Senate bill and House bill request guarantee date. (All bills filed by this date <i>must</i> be considered by committee.)
January 31	Senate bill and House bill introduction date. (Senate bills introduced after this date are referred to the Senate Rules Committee.)
February 21	House bills introduced after this date are referred to the House Rules Committee. (They are not guaranteed to have public committee hearings.)
March 17	Committee reporting courtesy date. Committees in each chamber should report out those bills they intend to pass favorably by this date.
March 23	Opposite chamber bill crossover date. The first chamber should pass those bills requiring consideration by the opposite chamber by this date.
March 30	Budget bill to be passed by both chambers by this date.
April 6	Adjournment.

Diagnosis and management of asymptomatic primary hyperparathyroidism: Summary of the National Institutes of Health (NIH) consensus statement

Multiphasic screening tests that detect hypercalcemia are identifying 100,000 new cases of hyperparathyroidism (HPT) in the U.S. each year, including many patients who have no symptoms of the disease. Women are affected twice as often as men, and the incidence of HPT increases with age.

Parathyroidectomy is a highly successful treatment for this disorder when performed by experienced surgeons. Some patients with asymptomatic primary hyperparathyroidism may have a prolonged benign course, and these patients may be managed without surgery. If patients do not have surgery, they must be monitored to detect progression of the disease. For these patients, the principal issue is how this can best be accomplished, balancing the need to identify skeletal, renal, or other complications that are indications for surgery against the burdens and expense of long-term monitoring.

To evaluate these issues, the National Institute of Diabetes and Digestive and Kidney Diseases and the Office of Medical Applications of Research of the National Institutes of Health held a Consensus Development Con-

ference on the Diagnosis and Management of Asymptomatic Primary Hyperparathyroidism October 29-31, 1990.

According to the panel, the diagnosis of HPT is based on two findings: persistent hypercalcemia along with elevated serum parathyroid hormone (PTH). Immunoassays for intact PTH using double antibody methods have simplified diagnosis.

Although all primary HPT patients should be considered candidates for surgery, the panel agreed that there may be a subgroup of patients with primary HPT that can be safely followed. Decisions regarding surgical or medical management must remain founded on clinical judgment on a case-by-case basis. The only acceptable treatment for these patients other than surgery is conscientious, long-term medical surveillance.

To qualify for nonsurgical management, a patient must have a serum calcium that is only mildly elevated, no previous episodes of life-threatening hypercalcemia, and normal renal and bone status. The panel recommended surgery for asymptomatic patients with any of the following indications: markedly elevated serum calcium; history of an

Diagnosis and management of asymptomatic primary hyperparathyroidism: A commentary

What does one do when a laboratory result returns revealing hypercalcemia in a patient not suspected to be ill? The answer is to confirm hypercalcemia with another serum calcium measurement, review the history and physical examination to sort out the various disorders that exist in the differential diagnosis of hypercalcemia, and then obtain a parathyroid hormone immunoassay (iPTH). The possibility is high that you have a patient with primary hyperparathyroidism (1° HPT). What to do from this point is the issue the National Institutes of Health (NIH) conference addressed.

Perspective

For the past quarter of a century, there has been a debate in the medical literature concerning what is the more appropriate management for just such a patient — medical surveillance or parathyroid surgery. It is important to recall that the descriptions of 1° HPT made in the early part of this century emphasized multisystem organ involvement.¹ Osteitis fibrosa cystica and renal stones were the most notable complications of the disease. Other important symptoms involved the gastrointestinal (peptic ulcer and pancreatitis, nonspecific abdominal pain), neuromuscular (lower extremity myopathy), and central nervous (alterations in mental status, personality changes) systems. The best chance for a cure that restored the serum calcium to normal was, and still

is, to have an experienced parathyroid surgeon perform neck exploration and remove abnormal parathyroid tissue.

In recent decades, the clinical presentation of 1° HPT has changed. The diagnosis is made earlier in the clinical course, partly because of increased physician awareness of the disease and, more frequently, because of blood screening tests that detect hypercalcemia. Many of these patients are considered asymptomatic.

The incidence of 1° HPT increases with age. Over 60 years of age, 1° HPT occurs twice as frequently in women (2/1000) as compared with men.² This group now represents the majority of 1° HPT patients and is usually seen by the primary physician.

Over the years, reports have suggested that a segment of asymptomatic 1° HPT patients may have a stable clinical course and that it is safe to medically follow them for many years.³⁻⁶ For example, 147 asymptomatic patients from the Mayo Clinic series were selected to be medically followed because of mild biochemical hyperparathyroidism. Serum calcium was < 11.0 mg/dl (8.9-10.1), and there was no objective roentgenographic evidence of bone or renal disease. During ten years of medical follow-up, 14 percent of the study population showed no progression of their disease. This is reassuring for those individuals who choose not to have parathyroid surgery or for those elderly patients who have serious concomitant illnesses that increase the risk from surgery.

Commentary

episode of life-threatening hypercalcemia; reduced creatinine clearance; presence of kidney stone(s) detected by abdominal radiograph; markedly elevated 24-hour urinary calcium excretion; or substantially reduced bone mass.

Surgery is also indicated if consistent follow-up seems unlikely; if coexistent illness complicates management; if the patient requests surgery or is younger than 50 years old, since the effects of decades of HPT are unknown and long-term compliance may be inadequate and/or particularly burdensome for younger patients.

Physicians and patients who forgo surgery must commit to long-term, conscientious monitoring for early recognition of worsening hypercalcemia, bone deterioration, renal impairment, the appearance or growth of renal stones, or the onset of typical parathyroid symptoms. Any of these developments may warrant surgery.

The patient should be seen at least semiannually until the lack of progression of the disease has been established. Once stability of these parameters is established in one to three years, evaluation can occur less frequently. Patients should drink lots of water, get plenty of exercise, and avoid loop or thiazide diuretics, as well as diets with restricted or excess calcium.

The panel evaluated the extensive experience acquired with imaging methods for localization of parathyroids and

found that preoperative localization in patients without prior neck operation is rarely indicated and not proven to be cost-effective.

The panel called for basic research into the causes of hyperparathyroidism, its molecular and cellular pathophysiology, and for the development of pharmacologic treatment. Additional studies should define the neuromuscular, psychological, cardiovascular and gastrointestinal effects of primary HPT, as well as its effect on bone strength and susceptibility to fracture. They further suggested a preliminary clinical trial in postmenopausal women randomized for estrogen therapy and surgery versus estrogen alone to provide data on bone mass and bone turnover without the confounding effects of estrogen deficiency. Such a trial would focus on the population with the highest incidence of HPT. Ultimately, the panel sees a need for a randomized, multicenter clinical trial to compare operative versus nonoperative management of asymptomatic hyperparathyroidism.

Single copies of the complete *NIH Consensus Statement on diagnosis and management of asymptomatic primary hyperparathyroidism* may be ordered from the Office of Medical Applications of Research, National Institutes of Health, Building 1, Room 260, 9000 Rockville Pike, Bethesda, MD 20892, (301-496-1143).

Despite such reports, others still recommend parathyroid surgery for asymptomatic 1° HPT patients. For example, about 20 percent of the original number from the Mayo Clinic series required neck surgery. In addition, there were some patients in this study who did not undergo surgery but who experienced progression of their disease. It is further recommended by some that the operation be performed as soon as possible to avoid the potential for increased morbidity/mortality from silent hypertension, osteoporotic bone and renal disease, and psychiatric illness.^{7,8} Organ dysfunction discovered early is reversible or can be stabilized following successful parathyroid surgery.

The debate has continued because there have not been any randomized prospective studies concerning health outcome, quality of life, and economic considerations between asymptomatic 1° HPT patients who have not had surgery and those patients who have had parathyroid surgery. Because of this quandary, the NIH sponsored a public meeting in the fall of 1990 to discuss the diagnosis and management of asymptomatic 1° HPT. Twenty-one papers were presented by investigators who outlined their experience with patients who had 1° HPT. These experts included internists, endocrinologists, surgeons, radiologists, and epidemiologists. The presentations from the individual speakers are to be published in *Bone and Mineral*. After listening to these

presentations and subsequent discussions with the audience, a panel of 14 experts (also representing various specialties) arrived at a consensus statement designed to act as a set of guidelines for physicians. This summary appears above, but the entire report appears in the April 1, 1991 issue of the *Annals of Internal Medicine*. A copy of the full report can also be obtained from the address noted at the end of the summary.

The consensus statement attempts to give answers to the following six questions: (1) What is the most accurate, cost-effective method of diagnosing hyperparathyroidism? (2) Are there patients with asymptomatic hyperparathyroidism who can safely be followed? Should they be? (3) If not operated on, how should asymptomatic patients be monitored and managed? (4) What are the indications for surgery in patients with asymptomatic hyperparathyroidism? (5) What is the role of gland localization technology in the management of patients with hyperparathyroidism? (6) What research should be done to classify issues in the diagnosis and management of hyperparathyroidism?

It is beyond the scope of this discussion to review the answers given to all six questions. However, some points discussed at the consensus conference and incorporated into the complete consensus statement deserve comment and amplification.

Definition of asymptomatic 1° HPT

The definition of asymptomatic 1° HPT was a point of controversy at the consensus conference. The summary statement did not call attention to this debate. The complete consensus statement defined asymptomatic 1° HPT as being without symptoms or signs commonly attributable to the disease. The definition excluded "one or several vague symptoms that cannot be definitely attributed to 1° HPT and that may be nonspecific or that may arise from a co-existing condition."⁹ The consensus statement included hypertension as an example of a "vague symptom." Hypertension has a higher frequency in the older population and, therefore, its occurrence with primary 1° HPT may be a coincidence and not a complication of 1° HPT.

Others at the conference strongly disagreed with this distinction.^{10,11} They asserted that hypertension, as well as psychiatric symptoms and fatigue, is an important manifestation of 1° HPT. They also presented evidence that a thorough history can detect subtle symptoms so that true asymptomatic 1° HPT is unusual. This interpretation is also supported by reports of so-called asymptomatic patients who, after successful parathyroid surgery, noted relief from previously unrecognized symptoms.

Diagnosis of 1° HPT

Total serum calcium (corrected for hypoalbuminemia) is preferred over ionized serum measurements. All agreed on the value of the new immunometric or immunoradiometric assay (IRMA) double antibody immunoreactive parathyroid hormone (IPTH) that measures intact 1-84 parathyroid hormone (PTH). The assay result is elevated in the majority of patients with 1° HPT (80-90 percent) and in the upper normal range in the remainder of patients. The finding of a low normal or suppressed IPTH rules out 1° HPT; it is found in nonparathyroid causes of hypercalcemia such as patients with malignant hypercalcemia. This is important in the differential diagnosis of hypercalcemia. The IPTH by radioimmunoassay (RIA) methods does not always distinguish patients with malignant hypercalcemia from those with 1° HPT. This type of assay is not as sensitive as the double antibody immunoassay and it measures parathyroid hormone fragments (i.e., carboxyl terminal assays) that accumulate in renal failure. Deviations in serum electrolytes such as low serum PO₄, HCO₃, and elevated Cl, although consistent with 1° HPT, are not diagnostic.

When parathyroid surgery should be considered

The protocol recommended by the panel for medical surveillance requires a cooperative patient. The time and cost for the patient has to be compared to the expense related to parathyroid surgery. The consensus statement agreed that asymptomatic patients are definite candidates for surgery if

serum calcium determinations are greater than 12 mg/dl; the 11.4-12.0 mg/dl range was designated as a gray zone. Other criteria to use when considering parathyroid surgery include creatinine clearance reduced by 30 percent compared with age-matched controls (increasing serum creatinine levels from baseline to within or above the normal range may reflect silent renal damage), 24-hour urine calcium < 400 mg (while on a ~400 mg calcium diet), and low bone-density measurements greater than two standard deviations below appropriate age-, sex-, and race-matched controls. There is evidence that excess parathyroid hormone resorbs more cortical than trabecular bone. This leaves uncertainty as to which bone site should be evaluated. For example, the wrist or hip has more compact relative to cancellous bone compared with the vertebral spine which has more cancellous bone.¹² The advantages and disadvantages of noninvasive techniques to measure such bone loss were discussed. Dual energy x-ray absorptiometry (DEXA) is the most promising technique in terms of precision. Patients under 50 years of age should also be considered for surgery because the long-term natural history of the disease has not been clearly defined.

Noninvasive parathyroid localization studies

Thallium-technetium scintigraphy, ultrasonography, computed tomography, and magnetic resonance studies are not helpful in 1° HPT patients prior to neck exploration. These procedures are too often negative in patients who have 1° HPT. There is also a significant false-positive rate, and such a result might lure the inexperienced into believing parathyroid surgery would be appropriate, easier, and faster. These tests should not be used to establish a diagnosis of 1° HPT. Localization is best accomplished at the time of neck exploration by an experienced surgeon in parathyroid surgery.

Medical treatment of asymptomatic 1° HPT

Agents were discussed that could affect parathyroid hormone secretion or action on bone. Although the number of studies are few, the only promising oral therapy was the use of estrogens in postmenopausal patients; this therapy antagonizes parathyroid hormone action on bone. Oral diphosphonates have not been shown to be effective in correcting the hypercalcemia of 1° HPT. In general, medical therapy focuses on keeping 1° HPT patients hydrated and avoiding factors that can aggravate hypercalcemia, such as thiazide diuretics and immobilization.

Conclusion

The consensus panel came to a definition for asymptomatic 1° HPT, but it is not universally accepted. Future prospective investigations for this condition will need to keep this definition in mind however when comparing parathyroid surgery with medical follow-up. The individual physician is

Commentary

less served by this definition. The statement from the NIH conference does not yet provide a definitive answer to the question of how one is to manage asymptomatic hyperparathyroidism. In the interim, physicians must listen to each patient and consider any symptoms and treatment selection on the basis of their impact on the quality of life. Keep in mind that there may be risks in medical follow-up, and that parathyroid surgery, despite its risks, is the only cure.

YOCON® YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in *Rauwolfia Serpentina* (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral alpha-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

STATE OF THE ART

DIAGNOSTIC TECHNOLOGY

Magnetic resonance imaging (MRI) is an important tool for today's physician. MRI produces VIVID images of the body in multiple planes. It is a painless procedure that does not involve surgery or potentially harmful radiation. MRI is frequently recommended for evaluation of neural, spinal, articular and pelvic disorders. It is safe and cost effective, and its various applications are being expanded at an impressive rate.

Health Images facilities are a community resource available to all area physicians.

Imaging Case of the Month

A 33-year-old white female presents with a one-month history of diarrhea and low grade fever. She now appears in the emergency room with a tender right lower quadrant mass and white blood count of 16,000.

Figure 3.

Figure 4.

Figure 5.

Imaging Case of the Month

Crohn's disease involving the terminal ileum

Figure 1. Severely affected terminal ileum with luminal narrowing and an adjacent mesenteric mass separating loops of small bowel.

Figure 2. Compression radiograph of the terminal ileum demonstrates a narrowed lumen with cobblestoning produced by intersecting longitudinal and transverse ulcerations.

Figure 3. CT delineates the marked thickening of a pelvic loop of small bowel in this patient.

Figure 4. One of the extra intestinal manifestations of Crohn's disease is mesenteric abscesses, well demonstrated on this CT scan.

Figure 5. CT scan in a patient with Crohn's disease, demonstrating a perirectal abscess extending anteriorly into the scrotum.

Clinical features and pathology

Crohn's disease is an idiopathic chronic inflammatory disease of the gastrointestinal tract. It is a transmural disease with segmental involvement of bowel. The disease follows a protracted course and is frequently complicated by formation of fistulas and abscesses.

Patients usually present between 15 and 30 years of age with complaints of abdominal pain and diarrhea. Other features include fever, weight loss, and anemia. Active gastrointestinal bleeding is uncommon. Crohn's disease may also present with recurring perirectal fistulas or abscesses.

Terminal ileum is the most common site of involvement (**Figure 1**). Small bowel is involved in over three-quarters of cases, with concurrent involvement of colon in just under 50 percent. Crohn's disease may involve any part of the gastrointestinal tract.

Crohn's disease is a transmural process. Mucosal abnormalities include aphthous ulcers and intersecting linear ulcerations which produce a cobblestone pattern (**Figure 2**). Islands of hyperplastic mucosa between these ulcerations are termed pseudopolyps. Lymphedema and cellular infiltration produce thickening of the bowel wall. Adenopathy and fibrofatty proliferation may occur in the mesentery, along with phlegmons and abscesses. Sinus tracts and fistulas occur with communication between bowel loops or to the urinary tract or skin. Extraintestinal manifestations of Crohn's disease include sclerosing cholangitis, cholelithiasis, nephrolithiasis, sacroiliitis, uveitis, and erythema nodosum.

Histologically, cascating granulomas are seen only in about half of patients. Other helpful features are lymphoid aggregates, deep fissures, and the transmural nature of the disease.

Radiographic findings

Early radiographic findings include thickened edematous folds and aphthous ulcerations. Cobblestoning and pseudopolyps are well demonstrated. Spasm, stricture formation, and fistulas may be seen in affected segments.

Computed tomography (CT) is extremely useful in the evaluation of the extramucosal components of Crohn's disease. Symmetrical thickening of the bowel wall (**Figure 3**) due to submucosal edema is well seen. Mesenteric processes can easily be differentiated with CT (**Figure 4**). The low density tissue of fibrofatty infiltration contrasts with the ill-defined soft tissue mass of a phlegmon. Abscesses are characterized by their fluid density, and may contain bubbles of air (**Figure 5**). Fistulas and sinus tracts can be traced with CT, and mesenteric adenopathy is well seen. The extraintestinal manifestations of Crohn's disease also are well demonstrated. CT is extremely useful in guiding percutaneous management of abscesses.

Tuberculosis and yersinia can produce identical findings in the terminal ileum. Other diseases that may affect this segment include lymphoma, carcinoid, radiation enteritis, and ischemic bowel disease.

Department Editor

Imaging Case of the Month

Imaging Case of the Month is a new department of the *Maryland Medical Journal* which will be featured on a regular basis. Coordinated by the Maryland Radiological Society, the cases will review a broad range of diseases and pathological processes of interest to a wide range of specialists. Physicians interested in submitting cases for publication consideration should contact the Department Editor.

A Clinical Moment With... Diabetes

Are hypoglycemic reactions dangerous?

Doctor, since I have been taking two injections of insulin daily with supplements of regular insulin when the blood glucose readings are above 150 mg/dl, I have been having insulin reactions shortly before mealtime two or three times a week. At these times, I perspire, my hands shake, and my heart beats fast. These symptoms are readily overcome by fruit juice or a glucose tablet. I have several questions about insulin reactions. I have heard that repeated hypoglycemic reactions may cause brain damage. Is that true? Also, if the reactions are more severe, what can I do to overcome them? Maybe close control of my glucose readings is not as desirable as I have been led to believe.

Close blood glucose control of diabetes usually means maintaining blood glucose test results between 80 and 140 mg/dl before meals and at bedtime, and a glycohemoglobin test within normal limits. Normal living activities, emotions, dietary indiscretions, and variable exercise will cause aberrations beyond these limits manifested by occasional hyperglycemia and hypoglycemic reactions. As the blood glucose concentration declines, a complex hormonal response occurs which includes release of epinephrine, glucagon, glucocorticoids, and growth hormone. Epinephrine release causes symptoms such as tachycardia, diaphoresis, and tremulousness — collectively called the adrenergic effect; these symptoms are particularly noticeable when the blood glucose falls rapidly. Central nervous system glucose deficiency or neuroglycopenia symptoms are headache, blurred vision, focal neurologic changes, and, ultimately, coma and death. Prompt restoration of glucose to a normal level usually leads to complete reversal of the symptoms, but prolonged hyperglycemia can cause irreversible neurologic damage.

As long as the symptoms or signs are of the adrenergic or early neuroglycopenic type, the use of oral glucose substances will usually bring about recovery within a few minutes. When a reaction is so severe as to cause confusion, inability to cooperate, or coma, the use of a glucagon injection or intravenous glucose infusion is mandatory. Recovery should occur within 20 minutes, but will vary with the duration of coma and the level of the blood glucose. Massaging the glucagon injection site with an alcohol sponge will speed the rate of utilization of the drug. The blood glucose level should be monitored if possible, and care should be taken not to overtreat the hypoglycemic state causing iatrogenic hyperglycemia. Reactions with recognizable adrenergic effect that can be readily treated with recovery are not dangerous. Close diabetic control should be continued.

Diabetic patients who do not manifest a recognizable adrenergic response due to advanced neuropathy, mental deficiency, concomitant drug therapy (e.g., beta-adrenergic blocking agents), or for any other reason, and who go into a neuroglycopenic behavior when hypoglycemia occurs,

should not attempt to attain close blood glucose control. The risk of brain damage and bodily injury are greater than the damage that will be produced by uncontrolled diabetes. Diabetic patients with an onset after 65 years of age will usually succumb to normal aging processes before the long-term complications of moderately controlled disease manifest themselves, and the stress of trying to maintain tight control hardly seems justified. Tight control of diabetes may also be hazardous for the patient who refuses to stop the use of alcohol. Moderation of diabetic control here is certainly justified.

A small group of patients for whom close self-monitoring of glucose is justified, are those individuals who lack confidence in self-management of their diabetes and who are constantly having anxiety symptoms they confuse with an adrenergic response. These people are almost always overweight and should document a low blood glucose test result (below 50 mg/dl) before consuming something to counteract the symptoms. In this type of person, it is usually a candy bar that they prefer to use to cope with the symptoms.

... A Commitment To Excellence

Board of Physician Quality Assurance Actions

**In the matter of
Howlett Jackson, M.D.
before the
Maryland Board of
Physician Quality Assurance
Final decision**

On July 25, 1990, the Board of Physician Quality Assurance (the Board) issued a Notice of Intent to Deny Application for Reinstatement of Licensure to Howlett S. Jackson, M.D. (the Applicant) under the Maryland Medical Practice Act of the Health Occupations Article, *Annotated Code of Maryland* (HO) §14-205(a)(1)(iii). This section permits the Board to refuse the application of an applicant for reinstatement of his license in accordance with reasons that are grounds for action under HO 14-404,¹ specifically:

- (a)(22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state.

In addition, the Board alleged that Applicant had not complied with the requirements for licensure reinstatement under HO §14-317 and in pertinent part, provides the following:

The Board shall reinstate the license of a physician who has failed to renew the license for any reason if the physician:

- (1) Meets the renewal requirements of §14-316 of this subtitle;
- (3) Submits to the Board satisfactory evidence of compliance with the qualifications and requirements established under this title for license reinstatements.

HO §14-316 sets forth the renewal requirements of the Act. It provides, *inter alia*:

- (c) Before the license expires, the licensee periodically may renew it for an additional term, if the licensee:
 - (3) Submits to the Board:
 - (ii) Satisfactory evidence of compliance with any continuing education requirements set under this section for license renewal.

The qualifications and requirements for continuing education reinstatement as set forth in COMAR 10.32.01.08C state:

- (1) A physician applying for renewal or re-instatement shall earn 50 credit hours of continuing medical education for each year of the period immediately preceding the licensee's renewal or re-instatement application, provided that no more than 150 credit hours may be required for a re-instatement application, and further provided that if a physician's license has been suspended or revoked by the Commission on Medical Discipline and is re-instated by the Board pursuant to Health Occupations Article §14-509, *Annotated Code of Maryland*, this physician shall earn a number of

hours which, together with any hours required pursuant to the Commission's Order, equals 150 credit hours.

- (2) The continuing medical education requirement may be satisfied as follows:
 - (a) Fifty credits earned for each year during the three-year period immediately preceding the licensee's renewal or re-instatement application toward the AMA Physician's Recognition Award, of which a minimum of 20 for each year of the registration period shall be in activities with AMA accredited sponsorship (Category 1);
 - (b) Fifty credits earned for each year during the three-year period immediately preceding the licensee's renewal or re-instatement application toward membership renewal in the American Academy of Family Physicians; or
 - (c) Fifty credits earned for each year during the three-year period immediately preceding the licensee's renewal or re-instatement application, in education programs sponsored by national medical societies and approved by the Board.
- (3) With the renewal application, a physician shall attest on a verified form to the fact that the physician has completed the continuing medical education requirement. Supporting documentation shall be retained for possible inspection by the Board for the succeeding six years.
- (4) The continuing medical education requirement shall apply to all renewal and re-instatement applications subsequent to the first renewal.

On December 13, 1990, a hearing was held before an Administrative Law Judge (ALJ). Present at the hearing were: the Applicant, counsel for Applicant, Norris Ramsey, Esquire; and Administrative Prosecutor for the Board, Robert J. Gilbert, Assistant Attorney General. At the hearing, the prosecutor withdrew the charge regarding the Applicant's failure to meet the continuing education requirements.

By letter dated February 19, 1991, the ALJ issued a Recommended Decision which included proposed Findings of Fact, proposed Conclusions of Law, and Recommendations. The parties were advised of their rights to file exceptions and present argument. No exceptions were filed and no argument requested. By letter dated April 4, 1991, the parties were advised by the Board that the Board would consider this case at its meeting on April 24, 1991 and issue a final decision.

At its meeting on Wednesday, April 24, 1991, the Board considered this case. On the affirmative vote of a majority of its full authorized membership, based on clear and convincing evidence, the Board issued the following Final Decision and Order.

At the hearing, the following documents were duly admitted into evidence:

<i>Joint Exhibit 1</i>	a copy of the medical records for Patient A.
<i>Joint Exhibit 1A</i>	original medical record for Patient A.
<i>Joint Exhibit 1B</i>	a copy of medical records for Patient A which was reviewed by Dr. Tilley.
<i>Joint Exhibit 2</i>	a copy of the medical records for Patient B.
<i>Joint Exhibit 3</i>	a copy of the medical records for Patient B.
<i>Joint Exhibit 3A</i>	original medical records for Patient B.

¹Health Occupations Article, Title 14, was renumbered effective January 1, 1991, pursuant to 11, Ch. 6, Acts 1990. All statutory cites are to the new numbers.

Board of Physician Quality Assurance Actions

<i>Joint Exhibit 3B</i>	a copy of medical records for Patient B which was reviewed by Dr. Tilley.
<i>Joint Exhibit 4</i>	a composite drug list for Patient B.
<i>Joint Exhibit 5</i>	a copy of the medical records for Patient C.
<i>Joint Exhibit 5A</i>	original medical records for Patient C.
<i>Joint Exhibit 5B</i>	a copy of medical records for Patient C which was reviewed by Dr. Tilley.
<i>Joint Exhibit 6</i>	a composite drug list for Patient C.
<i>Joint Exhibit 7</i>	an amended copy of the Notice of Intent to Deny Application for Reinstatement of Licensure Under the Maryland Medical Practice Act.
<i>State Exhibit 1</i>	the curriculum vitae of Larry Tilley, M.D.

Larry Tilley, M.D. testified for the state.

<i>Appellant Exhibit 1</i>	letter from Jack L. Mason, Ph.D., assistant dean for continuing medical education at the School of Medicine, University of Maryland at Baltimore, dated August 26, 1990.
<i>Appellant Exhibit 2</i>	letter from Gunther D. Hirsch, M.D. to the Maryland Board of Medical Examiners, dated December 12, 1990.
<i>Appellant Exhibit 3</i>	letter from Ivan I. Rotkovitz, P.D. to the Board of Medical Quality Assurance, undated.
<i>Appellant Exhibit 4</i>	letter from Percival Smith, M.D. to the Board of Medical Quality Assurance, dated December 12, 1990.
<i>Appellant Exhibit 5</i>	certification that Applicant completed 15 hours of Category 1 CME on April 22-23, 1987, from the University of Maryland School of Medicine Program of Continuing Education.

Appellant testified on his behalf.

Findings of fact

The Board, by clear and convincing evidence, finds:

1. Applicant was originally granted licensure to practice medicine in the State of Maryland on or about August 1977.
2. As a result of an investigation by Division of Drug Control (DDC), forwarded to the Committee on Drugs (COD), forwarded then to the Commission on Medical Discipline, and then to the Medical and Chirurgical Faculty, on or about March 30, 1989, the Board requested that the Peer Review Management Committee (PRMC) conduct a practice review of the Applicant's practice.
3. Larry Tilley, M.D. participated in the peer review of this case under the auspices of the PRMC, and the original medical records contained certain laboratory reports, demographic information and slips of paper which were not contained in the copies of the medical records reviewed by Dr. Tilley.
4. Applicant failed to renew his medical license in 1988 as

required, and he continued to practice medicine without a valid license until May 29, 1990.

5. The testimony of Applicant with regard to his lack of awareness of any possible abuse issues in the prescription of narcotic analgesic medications of Patients A and C was not credible.
6. The testimony of Applicant with regard to this method of recordkeeping was not credible.
7. The testimony of Dr. Tilley, with regard to the care rendered to Patients A, B, and C, and the recordkeeping for those patients, was credible and presented substantial evidence to refute the testimony of Applicant with regard to his care and recordkeeping for these patients.

The care rendered to Patient A by Applicant:

8. Patient A is a 36-year-old male who received treatment from Applicant from October 1985 through May 1990 for "lumbar discogenic disease" or "low back pain," and, at times, for chelitis, laryngitis, and bronchitis.
9. Applicant's long-term prescribing of narcotic analgesic pain medications for Patient A was not within the appropriate standard of care for the practice of medicine in the State of Maryland.
 - a. The only references to diagnostic testing contained in the medical record for Patient A are scant and do not indicate that any substantial diagnostic work-up was conducted:

straight leg raising + 25 degrees on right 40 degrees on left, can flex trunk 60 degrees.

neuro - DTR 2+ arms 0 at ankles and knee U/A ne

Pt. was in an auto accident yesterday which made his back feel much worse. Pt. has pain and intermittent paresthesia in right leg without urinary or fecal incontinence. SLR + 20 degrees bilaterally. Flexion pain 30 degrees. DTR's without legs.

Patient complains of severe back pain and excruciating pain in his right leg. Pain is helped slightly by Percodan. Patient has been mostly on bed rest for the last several days. Back is nontender. Straight leg raising is positive at 25 degrees on the right and 50 degrees on the left. Patient is markedly decreased active range of motion of the trunk. Patient got on the examining table with much difficulty and patient walks with limp.

Impression in lumbar disc degenerative disease, exacerbated by lumbosacral strain.

Plan hot packs and ultrasound of the back daily. Percodan q. 4-6 h. pm. Return to clinic in one week.

Pt. is going out of town for a week and will need prescription. Pt. continues to have excruciating back pain. Pain not helped much by TENS or back brace. Pain helped significantly by thermophore. Back minimally tender. Markedly decreased active range of motion due to pain. Percodan #50. Darvocet N-100. Q4-6 #50. Erythromycin ointment.

Board of Physician Quality Assurance Actions

- b. Over the five-year course of treatment, there are occasional entries in the medical records about the physical examination and other things, but the only treatment discussed in the medical records was the prescription of narcotic, analgesic pain medications, i.e., Tylox, Percodan, Percocet, and Darvocet.
 - c. The standard of care for the prescription of narcotic medication in the State of Maryland is to prescribe narcotics for intractable pain syndromes in quantities that do not suggest abuse by the patient, recognizing some degree of latitude in how much pain medication each individual needs.
 - d. During the relevant treatment period reviewed for this proceeding, Applicant prescribed Percodan, a narcotic, 72 times; Percocet, a narcotic, seven times; Darvocet-N 100, a narcotic, 34 times; and Tylox, a narcotic, ten times.
 - e. During the relevant treatment period reviewed for this proceeding, Applicant prescribed Percodan and Darvocet-N 100 at the same time on 14 occasions.
10. Applicant's long-term prescribing of narcotic analgesic pain medications for Patient A, in the absence of pursuing other therapeutic modalities, was not within the standard of care for the practice of medicine in the State of Maryland for the treatment of lumbar discogenic disease.
- a. The medical record indicates that Patient A had been previously diagnosed in 1985 as having lumbar discogenic disease.
 - b. The standard of care for the treatment of lumbar discogenic disease requires an evaluation of the etiology of the patient's back pain through diagnostic testing, some appropriate therapy (i.e., physical therapy, medication, non-steroidal, anti-inflammatory drugs, exercise programs), a possible consultation with an orthopaedic surgeon or neurosurgeon when appropriate, and possible referral to a rehabilitation specialist for some other kind of job training.
 - c. Applicant's testimony that Patient A had no medical insurance, could not afford extensive testing and treatment, and only wanted some pain relief so that he could continue to work was not credible as a justification for prescribing the quantity of narcotic medication involved in this case.
 - d. Applicant did not pursue diagnostic studies and other therapeutic modalities. The only treatments described in the medical records are the prescription of narcotic analgesic medications and occasional use of hot packs and ultrasound.
 - e. Although references are made in the medical record of magnetic resonance imaging (MRI), myelogram and evaluations by other physicians due to trauma, there are no reports of any of those tests or evaluations contained in the medical record other than a consultation report from Harold M. Hagen, M.D., radiologist, regarding an upper gastrointestinal (GI) tract evaluation.
 - f. Applicant was aware that Patient A, as a veteran, could have obtained the appropriate testing and additional treatment for discogenic disease from the Veterans' Administration (VA) at little or no cost to him, and yet did not make any such referral for him.
11. Applicant's long-term prescribing of narcotic-containing pain medications, in the quantities indicated, was inappropriate and below the standard of care for the practice of medicine in the State of Maryland.
- a. On 7/2/87, the patient received a prescription for Percodan, 60 tablets, and Darvocet-N, 60 tablets, and returned one week later, on 7/9/87 and received another prescription for Percodan, 60 tablets, and Darvocet-N, 60 tablets.
 - b. The issue of the additional prescription on 7/9/87 would indicate that the prior prescription had been used up, exhausted.
 - c. The use by a patient of 120 tablets in a one-week period would mean that the patient had taken 15 tablets per day of the medication, which is an inconceivable amount of medication for a patient such as Patient A to require.
 - d. The Applicant, in retrospect, recognized that his use of narcotic analgesic medication for Patient A was excessive.
12. Long-term usage of narcotic medications listed in Joint Exhibit 2 can produce drug dependency on the part of the patient.
13. Applicant knew, or should have known, that the patient was addicted to, or was becoming addicted to, the medications listed in Joint Exhibit 2, or was using them for other than therapeutically appropriate reasons.
- a. Applicant made several references in the medical records that he had spoken with the patient regarding the possible abuse of the medications. And, notwithstanding, he continued to prescribe large amounts of narcotic medications for him.
 - b. By Applicant's own testimony, he had worked in areas where there was rampant drug abuse, and he was aware of the proclivity of patients to abuse drugs such as Percodan, Darvocet-N, etc.
 - c. Patient A had presented to Applicant many of the same stories which are known to be used by abusers of medications: he had lost the prescription, the prescription was stolen, he was going out of town and needed additional medication, he did not want to pursue a remedy for the cause of the pain but preferred just to have medication in order to enable him to continue to work, etc.
 - d. Applicant's testimony that he had no reason to believe

Board of Physician Quality Assurance Actions

that Patient A was abusing the narcotic prescriptions given to him was not credible.

14. Applicant administered an injection of B₁₂ 1,000 mg IM for no apparent reason on May 14, 1988.

- a. The medical record for May 14, 1988

Pt. wants B₁₂ injection, going out of town. Back - markedly decreased active ROM. Imp. (1) lumbar discogenic disease. P - F/V at VAH. B₁₂ 1,000 mg IM.

- b. Vitamin B₁₂ is utilized only for the treatment of pernicious anemia.
c. It is below the standard of care to give a patient an injection of B₁₂ just because the patient asked for it.
d. There is no indication in the medical record that Patient A suffered from pernicious anemia.
e. Applicant, himself, recognized that vitamin B₁₂ usage for other than pernicious anemia has no particular medical benefit, but is of no particular harm.

15. The Applicant's medical record in regard to Patient A is deficient and not within the appropriate standard of care.

- a. An adequate medical record should contain the background information from the past history and the family history, and the history of the particular problem that is presented; the physical examination findings; results of diagnostic testing and laboratory testing; an assessment and a differential diagnosis; and a treatment plan.
b. It is especially important for the primary health care provider to maintain complete and adequate records for patients, and the Applicant was the primary health care provider for Patient A.
c. The medical record entries for most of the visits do not document a physical examination or evaluation performed by the Applicant to substantiate the low back pain or the Applicant's impression of the patient as having lumbar discogenic disease. Entries for 8/4/87, 8/17/87, 8/25/87, 10/7/87, 10/14/87, 10/15/87, 10/29/87, 11/5/87, 11/30/87, 12/13/87, 1/5/88, 4/27/88, 5/14/88, 6/2/88, 6/4/88, 8/10/88, 4/10/89, 5/1/89, 1/8/90, 1/22/90, 2/12/90, 4/12/90, 4/30/90, and 5/5/90 are examples of lack of documentation of a physical examination or evaluation.
d. The medical record does not contain sufficient historical information on the patient and other data in regard to the physical condition of the patient such as height, weight, blood pressure, pulse rate, the source of his pain, when the pain occurs, and under what circumstances his pain occurs. Entries for 8/4/87, 8/17/87, 8/25/87, 10/7/87, 10/14/87, 10/15/87, 10/29/87, 11/5/87, 11/30/87, 12/23/87, 1/5/88, 4/27/88, 5/14/88, 6/2/88, 6/4/88, 8/10/88, 4/10/89, 5/1/89, 1/8/90, 1/22/90, 2/12/90, 4/12/90, 4/30/90, and 5/5/90 are examples of lack of documentation of

historical information on the patient and other data in regard to the physical condition of the patient.

- e. The medical records do not contain evidence that Applicant attempted to verify his assessment of the lumbar discogenic disease.
i. There is no documentation in the record that Applicant ever ordered any radiographic or neurological testing to verify his continuing assessment of the patient's condition.
ii. There is no documentation in the medical record that Applicant ever requested or received medical records regarding testing by consulting physicians other than one consultation report from a radiologist regarding an upper GI study.
iii. The medical record contains entries that the patient had used a TENS (transcutaneous electrical nerve stimulation) unit (7/2/87 and 2/10/88); had nerve conduction studies at the VA Hospital (4/27/88); and was scheduled for an MRI, myelogram, and CAT (computer-assisted tomography) scans (9/5/89, 9/19/89, 11/14/89, 12/14/89, 5/5/90, and 5/23/90).
iv. The medical records do not contain any of the reports of those tests or reports from any consulting physician verifying that the tests were either scheduled or performed.
v. The medical records do not contain any test records from either the VA Hospital or the physician or clinic that provided the patient with the TENS unit.
f. It is important that medical records be kept in such a form that a successor physician could read an entry and have an idea of the status of the individual on that particular day and what therapy was intended for the future.
i. The medical records are deficient in that they are so insubstantial that it would be difficult for any successor physician to determine the significance of the entry or purpose of the visits for 8/17/87, 10/3/87, 10/7/87, 11/5/87, 2/23/88, 3/3/88, 6/2/88, 6/4/88, 8/10/88, 5/30/89, 7/20/89, 8/3/89, 8/15/89, 1/8/90, 1/22/90, 2/12/90, 4/12/90, and 4/20/90.
ii. The medical entry for 10/3/87 states only "patient has a great deal of low back pain."
iii. The medical entry for 11/5/87 states only "patient having cont. severe back pain."
iv. Medical entries for 2/23/88, 3/3/88, 6/2/88, 8/10/88, 1/8/90, 1/22/90, and 4/30/90 contain only prescription notations.
g. The medical record is deficient because, in several entries, there is no documentation by Applicant as to his rationale for prescribing narcotic analgesic pain medications.
i. Medical entries for 7/30/87, 10/7/87, 2/23/88, 3/3/88,

Board of Physician Quality Assurance Actions

6/2/88, 8/10/88, 1/8/90, 1/22/90, and 4/30/90 indicate narcotic analgesic pain medications were prescribed.

- ii. On each of these occasions, Applicant did not state, in the medical entry, the rationale for prescribing the medications of the specific condition that the patient experienced which justified the prescriptions.
- iii. The standard of care in prescribing drugs is to indicate the quantity of drugs prescribed in the medical record.
- iv. Applicant did not record the quantity of narcotic analgesic pain medications prescribed for the patient in the entries for 10/16/85, 12/27/85, 2/8/86, 2/17/86, 5/5/86, 5/12/86, 12/17/86, and 7/30/87.

The care rendered to Patient B by Applicant:

- 16. Patient B is a female patient, age 39, who began receiving treatment from Applicant in November 1985 and continued through April 1990, primarily for asthma, obesity, and arthritis. She also received treatment for other ailments such as anemia, anxiety, and psoriasis.
- 17. Between July 1987 and April 1990, Applicant treated the patient primarily with prescriptions for asthma medication and with anorectic medications, such as Adipex-P, Prelu 2, and Fastin. All treatment by Applicant was rendered in the form of office visits.
- 18. Joint Exhibit 4 is hereby incorporated by reference as a comprehensive list of the prescriptions issued to Patient B by Applicant from November 23, 1985 through March 26, 1990.
- 19. Applicant's treatment of Patient B's obesity was inappropriate.
 - a. The appropriate standard of care for the treatment of obesity would include documentation of the patient's height and weight, how much weight loss would be contemplated, and a program to lose the weight, which could include a specified diet to follow, an exercise program, and possibly anorectic drugs for a brief period of time.
 - b. During the four and one-half year period of treatment, Applicant treated the patient primarily by prescribing anorectic drugs as Adipex-P, Prelu 2, and Fastin.
 - c. The medical record does not contain any indication that the patient complained of obesity at the time of the initial examination (11/23/85) when Adipex was prescribed.
 - d. Over the course of a four and one-half year treatment with various anorectic drugs, the patient's weight varied only about 12 pounds.
 - e. The *Physicians' Desk Reference* states that anorectic medications are to be used for brief periods of time, i.e., two to four weeks.
 - i. The appropriate standard of care for use of anorectic drugs is for short intervals, as they are potentially habituating to the patient.
 - ii. A patient may develop a tolerance and a psychological addiction to the drugs.
 - iii. Anorectic drugs are also stimulants and sometimes can have an adverse affect in their stimulating characters.
 - f. The patient reported that an anorectic drug (Fastin) no longer curbed her appetite.
 - g. Applicant continued to prescribe Fastin to the patient on several additional occasions: 8/29/89, 10/24/89, 12/19/89, 12/27/89, 1/23/90, and 3/26/90.
 - h. Applicant's prescribing of anorectics was inappropriate in view of the patient's complaints of anxiety.
 - i. Anorectic drugs have the ability to cause some degree of anxiety or a hyperactive state, and they may contribute to an anxiety situation.
 - ii. On 8/29/89 and 12/19/89, the patient complained of anxiety and, yet, Applicant continued to prescribe anorectic medications for her.
 - i. Applicant's actions in monitoring the patient's blood pressure during the period in which the Applicant prescribed the anorectic medications was inappropriate.
 - i. Because one of the side reactions of anorectic drugs is the possible elevation of blood pressure, the standard of care is that any patient receiving anorectic medications have his/her blood pressure monitored at each office visit or in a timely fashion.
 - ii. Blood pressures for the patient were not recorded on 7/9/87, 8/6/87, 9/10/87, 8/29/88, and 9/13/88.
 - j. Applicant did not prescribe or did not document that he had prescribed a particular diet for the patient.
 - i. In treating a patient for obesity, the standard of care is to outline a diet program for the patient to follow — either one specifically written for the patient or a commercially available diet such as the Pritikin diet — which would be prescribed and written in the record.
 - ii. Applicant did not prescribe a specific diet for the patient to follow.
 - iii. On February 14, 1989 and March 26, 1990, Applicant noted only that the patient was to be placed on 1,000-2,000 calorie diet or was referred to the "Pritikin Program text," but no specific diet regimen was listed in the medical record.
 - iv. It is important, in the overall management of an obesity problem, to have a dietary program to follow and be monitored.
 - v. Applicant did not demonstrate that a specific dietary regimen was prescribed for this patient or that her obesity problem was properly monitored.

Board of Physician Quality Assurance Actions

- vi. Applicant's testimony that he regularly advised the patient to eat fewer calories and to exercise was not credible or substantial evidence that he placed her on a diet regimen or monitored her within the appropriate standard of care.
20. Applicant's evaluation and treatment of the patient's arthritis was inappropriate.
- The standard of care for the diagnosis and treatment of arthritis requires historical information which would suggest some type of joint problem; physical examination evidence by description of the joints; blood studies used for confirmation; and x-rays.
 - There was not sufficient documentation of the arthritis diagnosis in the patient's medical record.
 - Throughout the relevant treatment period (4/13/88, 5/13/88, 6/7/88, 8/29/88, 12/6/88, 12/20/88, 3/16/89, 4/25/89, 8/29/89, 10/24/89, 11/21/89, 12/19/89, 1/23/90, and 4/26/90), Applicant continued to assess the patient as having arthritis.
 - The medical record does not document any physical examinations of the patient regarding the diagnosis of rheumatoid arthritis.
 - Although Applicant often refers to "joint pain" suffered by the patient, there are only a few entries in the medical record which make reference to particular areas in which the patient suffered distress:

3/15/88: Pt. having problem with legs aching. Sometimes has to walk with a limp... Pt. having pain mostly in right knee and hip, feet swollen in a.m. Pt. feels tired all the time. Right knee not swollen erythematous or tender. Right elbow not swollen, tender, patient can extend left elbow to only about 160 degrees without difficulty.

8/29/88: Pt. having a great deal of problem with her hands especially in the a.m. Both wrists slightly swollen and tender not erythematous...

Undated: Patient complains of having some increased pain in her right shoulder and also the right hip over the last several days. The patient notes that she has had increased pain in the shoulder and hip since she started having her gold shots every other week instead of weekly...

3/26/90: ...The patient is having some hip pains, but they are being fairly well relieved by Motrin. The patient is now getting gold injections once monthly...
21. Applicant's medical record in regard to the treatment of Patient B is deficient and not within the appropriate standard of care.
- An adequate medical record should contain the background information from the past history and the family history, and the history of the particular problem that is presented; the physical examination findings; results of diagnostic testing and laboratory testing; an assessment and a differential diagnosis; and a treatment plan.
 - It is especially important for the primary health care provider to maintain complete and adequate records for patients, and Applicant was the primary health care provider for Patient B.
 - Applicant's medical entries for Patient B primarily consist of: the patient's chief and secondary subjective complaints; a diagnosis of any combination of asthma, arthritis, obesity and/or anxiety; and prescriptions of asthmatic drugs, anti-anxiety drugs, and anorectic medications.
 - The appropriate standard of care requires that, in the case of anemia, the record should contain documentation to support the diagnosis.
 - The medical record entry for 3/15/88 indicates that the patient was diagnosed as having anemia, and there is nothing in the medical record to suggest any physical symptoms or laboratory testing to substantiate this assessment.
 - The standard of care for diagnosis and treatment of obesity requires that the record document a weight reduction plan.
 - Applicant did not describe with specificity the weight reduction plans he prescribed for this patient.
 - The standard of care requires that the patient's age and height be listed in the medical record.
 - Although Applicant did list the patient's age (39 years) in the medical record, there is no recordation of her height.
 - The primary care giver should have information about the patient's conditions that are being treated by another physician in order to maintain an up-to-date record.
 - Although Applicant made several references to Dr. Marcus in this patient's record (Dr. Marcus is the physician from whom the patient received gold injections), there is only scant correspondence from Dr. Marcus contained in the medical record kept by Applicant (prescription slips and notations of complete blood count (CBC) results). There is no report or analysis of the patient's condition from Dr. Marcus contained in the medical record.
 - Several office visit entries for this patient contain either no information at all (3/29/88) or contain scant information which falls below the standard of care iterated above with regard to adequate recordkeeping (8/29/88, 9/20/88, and 1/23/90).
- The care rendered to Patient C by Applicant:*
22. Patient C began seeing Applicant in March 1987 with a complaint of low-back pain radiating to the right leg. The diagnosis was lumbar discogenic disease, and she continued to be treated by Applicant through November 1988. This patient was also treated by Applicant for

Board of Physician Quality Assurance Actions

- migraine headaches, depression, and anxiety. All of the treatment was in the form of office visits.
23. From May 21, 1987 through October 28, 1987, Applicant prescribed Percodan on 18 occasions (760 pills plus three prescriptions for no amounts listed).
 24. From January 6, 1988 through November 6, 1988, Applicant prescribed Fiorinal #3 on 22 occasions (996 pills plus two prescriptions with no amounts listed).
 25. Notwithstanding the fact that x-ray studies of the patient's lumbosacral spine were conducted at Harford Memorial Hospital in August 1987 to support the diagnosis of lumbosacral discogenic disease, the standard of care with regard to prescribing a narcotic analgesic pain medication is violated by the quantity of medications prescribed by Applicant for this patient.
 26. Percodan and Fiorinal #3 are narcotic analgesic medications.
 27. From 7/2/87 through 8/1/87, Applicant prescribed approximately 330 tablets of Percodan for this patient; in a five-week period of time (7/21/88 through 8/27/88), the Applicant prescribed 280 tablets of Fiorinal #3 for this patient which violates the standard of care.
 28. Applicant's testimony that he had no reason to believe that this patient was abusing the prescribed narcotic and controlled substances was not credible.
 29. Applicant's treatment of the patient's migraine headaches was inappropriate.
 - a. The appropriate standard of care in the diagnosis and treatment of migraine headaches requires an evaluation of the patient's complaint of headaches, an attempt to determine an etiology, a physical examination, specifically including certain neurological evaluations, and appropriate therapy for the specific case.
 - b. Although Fiorinal #3 is sometimes used for severe migraine headaches, the quantities utilized by Applicant for this patient violated the standard of care.
 - c. On 1/25/88, the date that the patient first complained of migraine headaches, there is no evidence in the medical record of any physical examination having been performed at all, other than a patient charge slip with "brief examination" circled and, thus, the diagnosis of tension or vascular headaches and prescribing of Fiorinal #3 at that time was below the standard of care.
 30. Applicant's medical record in regard to this patient is deficient and not within the appropriate standard of care.
 - a. An adequate medical record should contain the background information from the past history and the family history, and the history of the particular problem that is presented; the physical examination findings; results of diagnostic testing and laboratory testing; an assessment and a differential diagnosis; and a treatment plan.
 - b. The medical records for this patient did not meet the standard of care in that a substantial number of entries (7/2/87, 7/8/87, 7/15/87, 8/1/87, 8/31/87, and 10/10/87) do not adequately deal with the patients' complaints, a physical examination, or therapeutic modality.
 - c. The standard of care for medical records requires that a patient who is being followed for low-back pain, should contain documentation of the source of the pain, radiation, and activities which aggravate or improve the pain, and the Applicant's medical records for this patient do not contain this information.
 - d. The medical entries for 7/2/87, 7/8/87, 7/15/87, 7/22/87, 8/1/87, 8/31/87, 9/30/87, and 10/10/87 do not contain any documentation that Applicant performed a physical examination of the patient to verify his diagnosis of lumbar discogenic disease.
 - e. The standard of care in the treatment of patients such as Patient C requires that diagnostic studies sufficient to elucidate a diagnosis be made: x-rays, computed tomography (CT) scans, MRIs, and, possibly, neurosurgical or orthopaedic surgeon consultations.
 - f. The medical records for this patient document that an x-ray study of her lumbosacral spine was performed at Harford Memorial Hospital on August 4, 1987.
 - g. The medical record indicates that the patient received heat pack and electrical stimulation treatments on 7/2/87, 7/8/87, 7/15/87, 7/22/87, 7/28/87, and 8/1/87 and, although the record does not document the area in which the treatments were applied or the nature and extent of those treatments, it can be assumed that the treatments were applied to the lower back as that is the area in which all of the patient's complaints had been.
 - h. The medical record entries for July 2, 1987 and July 28, 1987 are below the standard of care for medical recordkeeping in that there is no subjective/objective assessment of the patient's condition.
 - i. The medical record entries for July 15, 1987, August 1, 1987, and October 10, 1987 are below the standard of care for medical recordkeeping as they do not specify the number of tablets or capsules of medication. The standard of care requires that the number of tablets or capsules of medication be listed in the medical record so at future reference to that entry one would know how many items of the medication a patient was given.
 - j. The fact that Applicant did not provide full documentation concerning assessments of the patient's complaints does not, in and of itself, render the recordkeeping by the Applicant below the standard of care. The recordkeeping, as a whole, falls below the appropriate standard of care.

Board of Physician Quality Assurance Actions

General findings with regard to the care of Patients A, B and C:

31. The recordkeeping for each of the patients is below the standard of care due to incompleteness and, thus, could prevent a subsequent physician from providing a continuum of care for the patients.
32. The prescribing of the unusually large number of narcotics and other controlled substances to Patients A and C is below the standard of care.
33. With regard to the care of Patients A and C, the care rendered to them by Applicant was below the standard of care in that the only treatment modality chosen was the use of narcotics and some minimal type of physical therapy given in the office. No other modalities were entertained, and no other diagnostic studies were done other than one back x-ray for Patient C.

Conclusions of law

On the basis of the above Findings of Fact, the Board, as a matter of law, concludes that a reason for denying Applicant's application for reinstatement is ground §14-404(a)(22), i.e., "fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital or any other location in this state."

The Board further concludes that Applicant did meet the continuing education requirements for reinstatement of his license.

Order

It is this 14th day of May 1991, by the Board of Physician Quality Assurance

ORDERED that the Applicant's application for reinstatement of his medical license under the Maryland Medical Practice Act be DENIED; and be it further

ORDERED that the charges based on failure to meet continuing education requirements for reinstatement are DISMISSED; and be it further

ORDERED that Applicant may petition the Board, through its Settlement Conference, for reinstatement of his license when he can demonstrate he has successfully completed a Board approved accredited training program; and be it further

ORDERED that this is a final order and as such is considered a public document pursuant to State Government Article, §10-617(h) *et seq.*

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance ■

In the matter of Omar K. Omland, M.D. before the Maryland Board of Physician Quality Assurance Consent order

On April 24, 1991, the State Board of Physician Quality Assurance (the Board), pursuant to its authority under *Md. Health Occ. Code Ann.*, §14-404, charged Omar K. Omland, M.D. (the Respondent) under *Md. Health Occ. Code Ann.* §14-404(a)(3)¹ with charges under the Maryland Medical Practice Act. The pertinent provisions of §14-404 provide:

- (a) Subject to the hearing provisions of §14-405 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:
 - (3) Is guilty of immoral ... conduct in the practice of medicine;

On May 22, 1991, a Settlement Conference (the Conference) was held. As a result of discussions at the Conference, Respondent agreed to enter into a Consent Order and the Conference recommended that the Board accept a Consent Order as a resolution of this case. At the Board meeting on Wednesday, June 26, 1991, by an affirmative vote of a majority of the full authorized Board who considered this case, the Board voted to enter into the following Consent Order.

Findings of fact

1. At all times relevant to these charges, Respondent was and is licensed to practice medicine in the State of Maryland.
2. Respondent has been practicing medicine in Montgomery County, Maryland since 1979 and has been a physician since 1972.
3. Respondent maintains a private office for the practice of medicine at 8021 Horseshoe Lane, Potomac, Maryland

¹ The basis of the allegations against Respondent was conduct that occurred between February 1984 and September 1986. The applicable statute in effect at that time was *Md. Health Occ. Code Ann.* §14-504(3) which provided:

Subject to the hearing provisions of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee is guilty of immoral conduct in the practice of medicine.

Section 1, Chapter 109, Acts of 1988, effective July 1, 1988, recodified former §14-504(3) as §14-504(a)(3), and inserted the following underlined words in the existing statute:

Is guilty of immoral or unprofessional conduct in the practice of medicine.

Section 11, Chapter 6, Acts of 1990, effective January 1, 1991, renumbered §14-504(a)(3) as §14-404(a)(3).

Board of Physician Quality Assurance Actions

20854. Respondent's practice is located in an office in his home.

4. Respondent's practice is limited to psychiatry.
5. Patient A was a patient of Respondent's from February 1984 to September 1986. Patient A initially sought treatment from Respondent for exhaustion and symptoms of depression after her father's death. Patient A was married and living with her husband when she first sought treatment from the Respondent.
6. During treatment sessions in 1985 and 1986, Respondent engaged in immoral conduct with Patient A by telling her that he loved her, and hugging and kissing her.
7. Respondent engaged in immoral conduct in November of 1985, when he met with Patient A in a restaurant and referred to this meeting as a date. Patient A met with Respondent at the restaurant under the belief that it was part of her psychiatric treatment.
8. Respondent engaged in immoral conduct when, during psychiatric appointments with Patient A, from February of 1986 through September of 1986, he had sexual contact with Patient A and permitted Patient A to have sexual contact with him.
9. Respondent engaged in immoral conduct in March of 1986 when Patient A advised him that she wished to wean herself from the prescription drugs that Respondent was prescribing to her. Respondent refused to assist Patient A in weaning her from the prescription drug Xanax. Although Patient A was suffering from clear symptoms of withdrawal, Respondent engaged in immoral conduct when he failed to provide appropriate medical assistance to Patient A during her withdrawal from Xanax.
10. The relationship between a psychiatrist and his/her patient is one of trust in which the patient is dependent, vulnerable, and relies on the physician. The patient in this relationship can easily be exploited and all caution should be exercised, by the physician, not to exploit this trust.
11. There is no valid medical treatment that involves sexual contact between a patient and treating psychiatrist during the course of psychiatric therapy sessions.
12. Sexual contact with a patient by a psychiatrist is exploitive and can harm the patient. Sexual contact with a patient by a psychiatrist is immoral conduct in the practice of medicine.
13. Respondent violated the trust and dependency placed in him by Patient A.
14. Respondent's conduct with Patient A was immoral and violated professional standards governing the appropriate practice of psychiatry in Maryland.
15. A standard for the delivery of quality surgical and medical care is NOT to engage in sexual contact with patients.
16. A standard for the delivery of quality surgical and medical care is not to violate the trust of a patient.
17. A standard for the delivery of quality surgical and medical

care is that a physician is required to assist his or her patient when the patient requests assistance.

18. As a medical review committee, as defined in §14-501 of the Health Occupations Article of the *Annotated Code of Maryland*, and as the regulatory Board governing the practice of medicine in Maryland, the Board is an appropriate peer review body to determine whether a licensee has failed to meet appropriate standards for the delivery of quality medical and surgical care in Maryland.

Conclusions of law

Based upon the foregoing Findings of Fact, the Board concludes, as a matter of law, that the Respondent is guilty of immoral conduct in the practice of medicine.

Order

Based upon the foregoing Findings of Fact and Conclusions of Law, it is this 11th day of July 1991, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case, hereby

ORDERED that Respondent's license to practice medicine in the State of Maryland is SUSPENDED for a period of three years, beginning July 4, 1991; and it is further

ORDERED that, on October 2, 1991, the SUSPENSION of Respondent's license to practice medicine in the State of Maryland will be STAYED and Respondent will be placed on PROBATION subject to the following conditions for a period of three years beginning October 2, 1991:

1. Respondent shall earn 75 credit hours of continuing medical education annually, of which a minimum of 45 credit hours shall be in activities with AMA accredited sponsorship (Category I) and a minimum of 25 credit hours shall be in the field of psychiatry as approved by the Board's Settlement Conference (the Conference). Within seven days of receipt of continuing medical education credit hours, Respondent shall send a copy of the certificate of attendance to the Board, attention: Stephen H. Johnson, Chief Case Manager.
2. In addition to the continuing medical education requirements listed in paragraph one above, Respondent shall attend Grand Rounds at a psychiatric facility on at least ten occasions during the probationary period. Prior to attending Grand Rounds, Respondent shall notify the Board, in writing, of the facility where Respondent would like to attend Grand Rounds. Respondent's attendance at a specific facility is subject to the Board's approval. Although continuing medical education credit hours may be awarded for attendance at Grand Rounds, the credit hours may *not* be applied toward satisfying the requirements of paragraph one above. Any credit hours received for attendance at Grand Rounds will be in addition to the

Board of Physician Quality Assurance Actions

75 credit hours of continuing medical education required annually.

3. Respondent shall attend the Harvard University Psychiatric Review Course sponsored by the Harvard Medical School in the spring of 1992 at his own expense. Within seven days of completion of the course, Respondent shall send a copy of the certificate of attendance to the Board, attention of the Chief Case Manager. Respondent may petition the Board to allow Respondent to attend another comparable course if, prior to January 1, 1992, Respondent notifies the Board, in writing, of the review course that Respondent would like to attend and Respondent provides a comprehensive description of the course to the Board. Respondent's attendance at a course other than the Harvard Review course is subject to the Board's approval. Continuing medical education credit hours received as a result of attending the course may be applied toward the 25 credit hours in the field of psychiatry as required in paragraph one above.
4. On or before August 15, 1991, Respondent shall submit to a psychiatric re-evaluation by John R. Lion, M.D. In addition, Respondent shall be re-evaluated by Dr. Lion at the end of each year of this probation. Respondent shall pay all costs associated with the evaluations. Respondent shall sign a release authorizing Dr. Lion to send copies of his reports to the Board. Respondent shall sign a release authorizing the Board to release the reports to the supervisory physicians, the peer reviewers, and Respondent's therapist. The Respondent shall receive a copy of each of these reports.
5. Respondent shall participate in psychotherapy with a psychiatrist (therapist) selected by Respondent from a list submitted by Dr. Lion to the Board.
 - a. The therapist will see Respondent for therapy on at least a weekly basis, and more often if the therapist thinks it is appropriate. Respondent must follow the recommendations for the number of therapy sessions made to Respondent. If the therapist believes that therapy should be terminated, then he/she can so notify Dr. Lion. Dr. Lion will then re-evaluate the Respondent and make a recommendation concerning continued therapy to the Board. The Board must approve the termination of therapy before the change becomes effective.
 - b. Respondent shall be responsible for all costs and expenses incurred in therapy.
 - c. The therapist shall submit monthly reports to the Suburban Maryland Psychiatric Society Peer Review Committee (SMPS PRC), attention: Ann Birk, M.D., indicating only that Respondent is attending the therapy sessions as recommended.
 - d. In the event that Respondent terminates therapy prior to discharge by the therapist, the therapist shall immediately notify the SMPS PRC that Respondent has terminated therapy.
 - e. In the event that the therapist has reason to believe that Respondent is a danger to himself or others, the therapist will immediately notify Dr. Birk of SMPS PRC.
 - f. In the event that the initial therapist is unable to continue treatment, through no fault of Respondent's, the therapist must immediately notify SMPS PRC. SMPS PRC, within ten days of receipt of the notice, shall present Respondent with a list of three approved psychiatrists from whom Respondent must immediately select another therapist. The new therapist must inform SMPS PRC in writing that he/she agrees to perform all duties required under this Order.
6. When Respondent resumes his practice on October 2, 1991, Respondent agrees to attend weekly supervision sessions under the supervision of one or two of the following psychiatrists:
 - (a) Larry Sack, M.D., Washington, DC 20008
 - (b) Edward Kirby, M.D., Washington, DC 20007
 - (c) Carol Kleinman, M.D., Chevy Chase, MD 20815
 - (d) Harold Eist, M.D., Bethesda, MD 20814Respondent shall meet with at least one of the supervising psychiatrists for at least one hour per week. Respondent is not required to attend more than two hours of supervision per week with the supervising psychiatrists.
7. Prior to resuming his practice on October 2, 1991, Respondent shall meet with the selected supervising psychiatrist(s) and he/she shall notify the Board, in writing, that he/she understands the terms of this Order and has reviewed all previous peer review reports and psychiatric evaluations of Respondent.
8. The supervisory psychiatrist(s) will meet with Respondent individually for weekly supervisory sessions for at least one year. The supervisor(s) will determine how much time each week is needed to review Respondent's practice.
9. The supervisory psychiatrist(s) will make quarterly written reports about Respondent's practice of psychiatry to the Board, attention of the Chief Case Manager. The reports are due on January 1, 1992; April 1, 1992; July 1, 1992; and October 1, 1992.
10. In the event that the supervisory psychiatrist(s) believes that Respondent is a danger to his patients or himself, or is not competent to practice psychiatry, or is in violation of this Order, the supervisor will immediately notify the Board.
11. In the quarterly reports due October 1, 1992, the supervisor(s) will discuss whether weekly supervisory sessions should be continued. The Board must ratify the supervisor(s)' recommendations before any change in supervision becomes effective.

Board of Physician Quality Assurance Actions

12. Respondent shall pay all costs associated with the weekly supervisory sessions and the quarterly reports. The supervisory psychiatrist(s) will submit a bill to Respondent on a monthly basis. If Respondent fails to pay the bill in a timely fashion, not to exceed within 60 days, the supervisory psychiatrist(s) will notify the Board. Failure to pay all bills within 60 days shall result in a violation of this Order.
13. Respondent will be subject to an annual peer review of his practice by the SMPS PRC, administrative costs to be paid by the Respondent. The SMPS PRC will submit a report to the Board once each year on the results of the peer review of Respondent's practice, the first report being due on or before October 4, 1992. The Respondent will receive a copy of the report and must follow any recommendations made by SMPS PRC and endorsed by the Board.
14. Respondent shall not engage in the type of conduct that led to the charges brought against him by the Board on April 24, 1991.
15. Respondent shall practice in accordance with the laws governing the practice of medicine in Maryland.
16. Respondent shall be responsible for all costs for the additional training, supervision, and psychiatric therapy that he is to obtain during this probation.

ORDERED that if Respondent violates any of the foregoing conditions of probation, the stay may be lifted and the Board, after notification, a hearing, and a determination of violation, may impose any additional disciplinary sanctions it deems appropriate; and be it further

ORDERED that if Respondent presents a danger to the public health, safety, or welfare, the Board, WITHOUT PRIOR NOTICE AND AN OPPORTUNITY FOR A HEARING, MAY VACATE THE STAY OF SUSPENSION AND REINSTATE THE SUSPENSION, provided that Respondent is given notice of the Board's action and an opportunity for a hearing within thirty days after Respondent requests a hearing; and be it further

ORDERED that on or before 3:00 pm on July 3, 1991, Respondent shall hand-deliver to Margaret T. Anzalone, Deputy Director of the Board, at the Board's office, 4201 Patterson Avenue, Baltimore, Maryland, the following items:

1. his original Maryland license from the Board of Medical Examiners;
2. his most current renewal certificate from the Board;
3. his wallet-size renewal card from the Board;
4. his U.S. Drug Enforcement Administration Registration (DEA) Certificate;
5. his Maryland Controlled Dangerous Substances Registration Certificate;
6. any prescription pads on which his name and DEA number are imprinted;

² These items were delivered prior to the Order being executed as Respondent's good faith gesture that he would execute the Order which was being drafted and revised.

7. all DEA order forms²; and be it further

ORDERED that, three years after the effective date of the Order, that being the date on which the Board signs the Order, Respondent may petition the Board for termination of probation and reinstatement of his license without any conditions or restrictions to the Board. Prior to submitting petition for reinstatement, Respondent must be evaluated by a psychiatrist selected by the Board. Respondent shall bear the burden of proving, to the Board's satisfaction, that he has complied with all the conditions of this Order. NOTHING IN THIS ORDER SHALL BE CONSTRUED AS A PROMISE BY THE BOARD TO REINSTATE RESPONDENT'S LICENSE WITHOUT CONDITIONS; and be further

ORDERED that Respondent will be responsible for all costs incurred under this Consent Order; and be it further

ORDERED that this Consent Order is considered a public document pursuant to *Md. State Gov't Code Ann.* §10-611, *et seq.* (1984).

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Consent

By signing this Consent, I hereby accept and agree to be bound by the foregoing Consent Order and its conditions and restrictions, consisting of 17 pages.

1. By signing this Consent, I do not admit to the truth of many of the Findings of Fact or agree with the Conclusions of Law. Indeed, I dispute and deny any liability or wrongdoing. However, I submit to the foregoing Order as a resolution of this case.
2. I acknowledge the validity of this Order as if made after a hearing in which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law.
3. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this Consent I waive all such rights.
4. I am not represented by an attorney. When I received the Charges Under the Maryland Medical Practice Act on April 26, 1991, I was advised, in writing, to be represented by an attorney at all stages of this proceeding. I was also advised of my right to have counsel at the Settlement Conference. Considering carefully the advice to have counsel, I chose to exercise my constitutional right to represent myself.
5. I understand that if I fail to comply with any of the conditions of probation enumerated above, I may suffer disciplinary action against my license to practice medicine in the State of Maryland.
6. I understand that if I present danger to the public health, safety, or welfare, the Board may, WITHOUT NOTICE

Board of Physician Quality Assurance Actions

PRIOR TO AN OPPORTUNITY TO BE HEARD, vacate the stay of suspension, reinstate the suspension, and reinstitute formal proceedings against my license to practice medicine in Maryland.

7. I have had an opportunity to review this Order with an attorney. I voluntarily sign this Order understanding its meaning and effect.

OMAR K. OMLAND, M.D.

Auxiliary

The Auxiliary's Day in Annapolis Wednesday, January 29, 1992

What makes the Auxiliary's Day in Annapolis special? The answer is simple. Individual auxiliary members from all over the state can meet with their own legislators in a warm and friendly atmosphere. It is easy to come, enjoy lunch and just listen to legislative conversations.

This year there will be an informative discussion of some of the hot issues, both pro and con, at the morning meeting. As the State Legislative Chairperson for the Auxiliary, I want to help make everyone feel more comfortable when responding to a legislative alert. There are many times when auxiliary members can really help their local medical societies and Med Chi by writing letters or calling legislators. Participants will get some tips on how to contribute more effectively to this team effort.

Through the years, I have always found the attending legislators to be very friendly in general, and particularly interested in their constituents' concerns. This is an excellent opportunity for auxiliary members to get to know their legislators on a more personal level. Auxilians will walk away with a greater appreciation of the legislative process and the many individuals who influence it.

Anyone wishing to attend, can make reservations by calling Ms. Jo Ann Troisi in the Auxiliary office at Med Chi (410-539-0872 or 1-800-492-1056).

SUE SHERWOOD

Sue Sherwood has been a member of Med Chi's Legislative Committee for five years, a board member of the Maryland Medical Political Action Committee (MMPAC) for three years, and previously served as the editor of *Maryland Medicine*, the MMPAC newsletter. Five years ago, she started a legislative committee in the Auxiliary to the Anne Arundel Medical Society. In addition, she organized a well-attended meeting in November 1991 for Anne Arundel County physicians to learn to use the Med Sig Bulletin Board because of its legislative content. ■

Continuing...

For over fifteen years, the Med Chi Agency has been serving the needs of Maryland physicians...*your* needs, with unrivaled commitment and dedication. And as the Agency has grown, so has your trust...in us, in our products and in the way we do business with you.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial options. Among these are:

Professional Liability Insurance (Malpractice)

Personal insurance, including homeowners, auto, boat and recreational vehicle coverage and personal umbrella insurance.

Office insurance, including medical equipment, medical records, computer equipment, account receivables, workers compensation, business auto and employee dishonesty

Financial and estate planning, specifically tailored to the medical professional.

Individual and group, life, health and income protection.

Qualified and non-qualified Retirement Planning

...A Commitment To Service

January, 1992

Diphtheria, Tetanus, and Pertussis:

ACIP Recommendations for Vaccine Use and Other Preventive Measures

PREPARATIONS USED FOR VACCINATION

Diphtheria and tetanus toxoids are prepared by formaldehyde treatment of the respective toxins and are standardized for potency according to the regulations of the U.S. Food and Drug Administration.

Pertussis vaccine is a suspension of inactivated *Bordetella pertussis* cells.

The following preparations are currently available in the United States:

1. Diphtheria and Tetanus Toxoids and Pertussis Vaccine Adsorbed (DTP) and Diphtheria and Tetanus Toxoids Adsorbed (DT) (for pediatric use) are for use among infants and children <7 years of age.
2. Tetanus and Diphtheria Toxoids Adsorbed for Adult Use (Td) is for use among persons ≥ 7 years of age.
3. Pertussis Vaccine Adsorbed (P), Tetanus Toxoid (fluid), Tetanus Toxoid Adsorbed (T), and Diphtheria Toxoid Adsorbed (D) (for pediatric use), are single-antigen products for use in special instances when combined antigen preparations are not indicated.

Work is in progress to study the effectiveness of improved acellular pertussis vaccines that have reduced adverse reaction rates. Currently, several candidate vaccines containing at least one of the bacterial components thought to provide

protection are undergoing clinical trials. In published studies, some of these vaccines are less prone to cause common adverse reactions than the current whole-cell preparations, and they are immunogenic. Whether their clinical efficacy among infants is equivalent to that of the whole-cell preparations remains to be established.

VACCINE USAGE

The standard, single-dose volume of each of DTP, DT, Td, single-antigen adsorbed preparations of pertussis vaccine, tetanus toxoid, and diphtheria toxoid, and of the fluid tetanus toxoid is 0.5 mL. Adsorbed preparations should be administered intramuscularly (IM).

TABLE 1. Routine diphtheria, tetanus, and pertussis vaccination schedule summary for children <7 years of age—United States, 1991

Dose	Customary age	Age/interval	Product
Primary 1	2 months	6 week old or older	DTP [†]
Primary 2	4 months	4-8 weeks after first dose*	DTP [†]
Primary 3	6 months	4-8 weeks after second dose*	DTP [†]
Primary 4	15 months	6-12 months after third dose*	DTP [†]
Booster	4-6 years old, before entering kindergarten or elementary school (not necessary if fourth primary vaccinating dose administered after fourth birthday)		DTP [†]
Additional boosters		Every 10 years after last dose	Td

*Prolonging the interval does not require restarting series.

[†]Use DT if pertussis vaccine is contraindicated. If the child is ≥ 1 year of age at the time that primary dose three is due, a third dose 6-12 months after the second completes primary vaccination with DT.

TABLE 2. Routine diphtheria, tetanus, and pertussis vaccination schedule summary for persons ≥ 7 years of age—United States, 1991

Dose	Age/interval	Product
Primary 1	First dose	Td
Primary 2	4-8 weeks after first dose*	Td
Primary 3	6-12 months after second dose*	Td
Booster	Every 10 years after last dose	Td

*Prolonging the interval does not require restarting series.

PRIMARY VACCINATION AND BOOSTERS

Vaccination schedules for children <7 and those ≥ 7 and adults are shown in Tables 1 and 2.

SPECIAL CONSIDERATIONS

For children < 7 years of age with a contraindication to pertussis vaccine (see Precautions and Contraindications), DT should be used instead of DTP. To ensure that there will be no interference with the response to DT antigens from maternal antibodies, previously unvaccinated children who receive their first DT dose when <1 year of age should receive a total of four doses of DT as the primary series, the first three doses at 4 to 8 week intervals and the fourth dose 6-12 months later (similar to the recommended DTP schedule) (Table 1). If additional doses of pertussis vaccine become contraindicated after a DTP series is begun in the first year of life, DT should be substituted for each of the remaining scheduled DTP doses.

Unvaccinated children ≥ 1 year of age for whom pertussis vaccine is contraindicated should receive two doses of DT 4-8 weeks apart, followed by a third dose 6-12 months later to complete the primary series. Children who have already received one or two doses of DT or DTP after their first birthday and for whom further pertussis vaccine is contraindicated should receive a total of three doses of a preparation containing diphtheria and tetanus toxoids appropriate for age, with the third dose administered 6-12 months after the second dose. Children who complete a primary series of DT before their fourth birthday should receive a fifth dose of DT before entering kindergarten or elementary school. This dose is not necessary if the fourth dose of the primary series was given after the fourth birthday.

PERSONS WHO HAVE RECOVERED FROM TETANUS OR DIPHTHERIA

Tetanus or diphtheria infection may not confer immunity; therefore, active vaccination should be initiated at the time of recovery from the illness, and arrangements made to ensure that all doses of a primary series are administered on schedule.

CHILDREN WHO HAVE RECOVERED FROM PERTUSSIS

Children who have recovered from satisfactorily documented pertussis do not need pertussis vaccine. Satisfactory documentation includes recovery of *B. pertussis* on culture or typical symptoms and clinical course when epidemiologically linked to a culture-proven case, as may occur during outbreaks. When such confirmation of the diagnosis is lacking, DTP vaccination should be completed, because a presumed pertussis syndrome may have been caused by other *Bordetella* species, *Chlamydia*, or certain viruses.

ADULT VACCINATION WITH Td

Adults with uncertain histories of a complete primary vaccination series should receive a primary series using the combined Td toxoid (Table 2). To ensure continued protection, booster doses of Td should be given every 10 years.

USE OF SINGLE-ANTIGEN PREPARATIONS

Available data do not indicate substantially more adverse reactions following receipt of Td than following receipt of single-antigen, adsorbed tetanus toxoid. Furthermore, adults may be even less likely to have adequate levels of diphtheria antitoxin than of tetanus antitoxin. The routine use of Td in all medical settings, including office practices, clinics, and emergency rooms, for all persons ≥ 7 years of age who need primary vaccination or booster doses will improve levels of protection against both tetanus and diphtheria, especially among adults.

SIDE EFFECTS AND ADVERSE REACTIONS FOLLOWING DTP VACCINATION

Local reactions (generally erythema and induration with or without tenderness) are common after the administration of vaccines containing diphtheria, tetanus, or pertussis antigens. Occasionally, a nodule may be palpable at the injection site of adsorbed products for several weeks. Sterile abscesses at the injection site have been reported rarely (6-10/million doses of DTP). Mild systemic reactions such as fever, drowsiness, fretfulness, and anorexia occur frequently. These reactions are substantially more common following the administration of DTP than of DT, but they are self-limited and can be safely managed with symptomatic treatment.

Acetaminophen is frequently given by physicians to lessen fever and irritability associated with DTP vaccination, and it may be useful in preventing seizures among febrile-convulsion-prone children. However, fever that does not begin until ≥ 24 hours after vaccination or persists for more than 24 hours after vaccination should not be assumed to be due to DTP vaccination. These new or persistent fevers should be evaluated for other causes so that treatment is not delayed for serious conditions such as otitis media or meningitis. Moderate-to-severe systemic events, include high fever (i.e., temperature of $\geq 40.5^\circ \text{C}$ (105°F); persistent, inconsolable crying lasting ≥ 3 hours; collapse (hypotonic-hyporesponsive episode); or short-lived convulsions (usually febrile). These events occur infrequently. These events appear to be without sequelae. Other more severe neurologic events, such as a prolonged convulsion or encephalopathy, although rare, have been reported in temporal association with DTP administration.

The National Childhood Encephalopathy Study (NCES) was the basis of prior Immunization Practices Advisory Committee (ACIP) statements suggesting that on rare occasions DTP vaccine could cause brain damage. However, on the basis of a more detailed

review of the NCES data as well as data from other studies, the ACIP has revised its earlier view and now concludes:

1. Although DTP may rarely produce symptoms that some have classified as acute encephalopathy, a causal relation between DTP vaccine and permanent brain damage has not been demonstrated. If the vaccine ever causes brain damage, the occurrence of such an event must be exceedingly rare. A similar conclusion has been reached by the Committee on Infectious Diseases of the American Academy of Pediatrics, the Child Neurology Society, the Canadian National Advisory Committee on Immunization, the British Joint Committee on Vaccination and Immunization, the British Pediatric Association, and the Institute of Medicine.
2. The risk estimate from the NCES study of 1:330,000 for brain damage should no longer be considered valid on the basis of continuing analyses of the NCES and other studies.

Recent data suggest that infants and young children who have ever had convulsions (febrile or afebrile) or who have immediate family members with such histories are more likely to have seizures following DTP vaccination than those without such histories. For those with a family history of seizures, the increased risks of seizures occurring within 3 days of receipt of DTP or 4-28 days following receipt of DTP are identical, suggesting that these histories are non-specific risk factors and are unrelated to DTP vaccination.

Rarely, immediate anaphylactic reactions (i.e., swelling of the mouth, breathing difficulty, hypotension, or shock) have been reported after receipt of preparations containing diphtheria, tetanus, and/or pertussis antigens. However, no deaths caused by anaphylaxis following DTP vaccination have been reported to CDC since the inception of vaccine-adverse-events reporting in 1978, a period during which more than 80 million doses of publicly purchased DTP vaccine were administered.

REPORTING OF ADVERSE EVENTS

The U. S. Department of Health and Human Services has established a new Vaccine Adverse Event Reporting System (VAERS) to accept all reports of suspected adverse events after the administration of any vaccine, including but not limited to the reporting of events required by the National Childhood Vaccine Injury Act of 1986. The telephone number to call for answers to questions and to obtain VAERS forms is 1-800-822-7967, or in Maryland 410-225-6679. *Vaccine adverse events are reportable to your local health department in Maryland.*

REDUCED DOSAGE SCHEDULES OR MULTIPLE SMALL DOSES OF DTP

The ACIP recommends giving only full doses (0.5mL) of DTP vaccine; if a specific contraindication to DTP exists, the vaccine should not be given.

Concern about adverse events following pertussis vaccine has led some practitioners to reduce the volume of DTP vaccine administered to <0.5mL/dose in an attempt to reduce side effects. No evidence exists to show that this decreases the frequency of uncommon severe adverse events, such as seizures and hypotonic-hyporesponsive episodes.

SIMULTANEOUS ADMINISTRATION OF VACCINES

The simultaneous administration of DTP, oral poliovirus vaccine (OPV), and measles-mumps-rubella vaccine (MMR) has resulted in seroconversion rates and rates of side effects similar to those observed when the vaccines are administered separately. Simultaneous vaccination with DTP, MMR, OPV, or inactivated poliovirus vaccine (IPV), and *Haemophilus b* conjugate vaccine (HbCV) is also acceptable. The ACIP recommends the simultaneous administration of all vaccines appropriate to the age and previous vaccination status of the recipient, including the special circumstance of simultaneous administration of DTP, OPV, HbCV, and MMR at 15 months of age.

PRECAUTIONS AND CONTRAINDICATIONS

General Considerations

The decision to administer or delay DTP vaccination because of a current or recent febrile illness depends largely on the severity of the symptoms and their etiology. Although a moderate or severe febrile illness is sufficient reason to postpone vaccination, minor illnesses such as mild upper-respiratory infections with or without low-grade fever are not contraindications.

Routine physical examinations or temperature measurements are not prerequisites for vaccinating infants and children who appear to be in good health. Appropriate immunization practice includes asking the parent or guardian if the child is ill, postponing DTP vaccination for those with moderate or severe acute ill-

TABLE 3. Contraindications and precautions to further DTP vaccination

Contraindications

- An immediate anaphylactic reaction.
- Encephalopathy occurring within 7 days following DTP vaccination.

Precautions

- Temperature of ≥ 40.5 C (105 F) within 48 hours not due to another identifiable cause.
- Collapse or shock-like state (hypotonic-hyporesponsive episode) within 48 hours.
- Persistent, inconsolable crying lasting ≥ 3 hours, occurring within 48 hours.
- Convulsions with or without fever occurring within 3 days.

nesses, and vaccinating those without contraindications or precautionary circumstances.

A history of prematurity generally is not a reason to defer vaccination.

Special Considerations for Preparations Containing Pertussis Vaccine

Contraindications

If any of the events listed in Table 3 occur in temporal relationship to the administration of DTP, further vaccination with DTP is contraindicated (see Table 3).

Misconceptions Concerning Contraindications to DTP

Some health-care providers *inappropriately* consider certain conditions or circumstances as contraindications to DTP vaccination. These include the following:

1. Soreness, redness, or swelling at the DTP vaccination site or temperature of $<40.5^{\circ}\text{C}(105^{\circ}\text{F})$.
2. Mild, acute illness with low-grade fever or mild diarrheal illness affecting an otherwise healthy child.
3. Current antimicrobial therapy or the convalescent phase of an acute illness.
4. Recent exposure to an infectious disease.
5. Prematurity. The appropriate age for initiating vaccination among the prematurely born infant is the usual chronological age from birth. Full doses (0.5 mL) of vaccine should be used.
6. History of allergies or relatives with allergies.
7. Family history of convulsions.
8. Family history of SIDS.
9. Family history of an adverse event following DTP vaccination.

TETANUS PROPHYLAXIS IN WOUND MANAGEMENT

Chemoprophylaxis against tetanus is neither practical nor useful in managing wounds. Wound cleaning, debridement when indicated, and proper immunization

are important. The need for tetanus toxoid (active immunization), with or without TIG (passive immunization), depends on both the condition of the wound and the patient's vaccination history (Table 4;). If a contraindication to using tetanus toxoid-containing preparations exists for a person who has not completed a primary series of tetanus toxoid immunization and that person has a wound that is neither clean nor minor, *only* passive immunization should be given using tetanus immune globulin (TIG). Rarely has tetanus occurred among persons with documentation of having received a primary series of toxoid injections.

PROPHYLAXIS FOR CONTACTS OF PERTUSSIS PATIENTS

Spread of pertussis can be limited by decreasing the infectivity of the patient and by protecting close contacts. To reduce infectivity as quickly as possible, a course of oral erythromycin (children: 40 mg/kg/day; adults: 1 g/day) or trimethoprim-sulfamethoxazole (children: trimethoprim 8 mg/kg/day, sulfamethoxazole 40 mg/kg/day; adults: trimethoprim 320 mg/day, sulfamethoxazole 1,600 mg/day) is recommended for patients with clinical pertussis. Antimicrobial therapy should be continued for 14 days to minimize any chance of treatment failure.

Erythromycin or trimethoprim-sulfamethoxazole prophylaxis should be administered for 14 days to all household and other close contacts of persons with pertussis, regardless of age and vaccination status. Although data from controlled clinical trials are lacking, prophylaxis of all household members and other close contacts may prevent or minimize transmission. All close contacts <7 years of age who have not completed the four-dose primary series should complete the series with the minimal intervals (Table 1). Those who have completed a primary series but have not received a dose of DTP vaccine within 3 years of exposure should be given a booster dose.

TABLE 4. Summary guide to tetanus prophylaxis in routine wound management, 1991

History of adsorbed tetanus toxoid (doses)	Clean, minor wounds		All other wounds*	
	Td([†])	TIG	Td([†])	TIG
Unknown or <3	Yes	No	Yes	Yes
≥ 3 ([§])	No([†])	No	No(^{**})	No

*Such as, but not limited to, wounds contaminated with dirt, feces, soil, and saliva; puncture wounds; avulsions; and wounds resulting from missiles, crushing, burns and frostbite.

[†]For children <7 years old; DTP (DT, if pertussis vaccine is contraindicated) is preferred to tetanus toxoid alone. For persons ≥ 7 years of age, Td is preferred to tetanus toxoid alone.

[§]If only three doses of *fluid* toxoid have been received, then a fourth dose of toxoid, preferably an adsorbed toxoid, should be given.

[†]Yes, if >10 years since last dose.

^{**}Yes, if >5 years since last dose. (More frequent boosters are not needed and can accentuate side effects.)

American Medical Association

Physicians dedicated to the health of America

For Your Benefit

Materials included are excerpted from *Member Matters*, a monthly publication sent to all members of the American Medical Association. *For Your Benefit* is provided by the American Medical Association.

AMA Helps Our Patients Lead Healthier Lives

Providing information to help your patients has always been an integral part of the American Medical Association's mission. What distinguishes today's patient activities from past efforts is the AMA's direct and individual approach ... echoing the trust and support patients experience from their own physicians.

Major activities include the Consumer Book Program, a weekly television show on health, national health campaigns and a test for a consumer health magazine.

Highlights of these projects are:

- the *AMA Handbook of First-Aid and Emergency Care*, was ranked fifth on the Book-of-the-Month Club's best-seller list,

- "Living Well America!" broadcast Sunday mornings and hosted by NBC's "Today Show" Dr. Art Ulene, is a fast-paced, entertaining program focusing on everyday health problems,

- "Campaign Against Cholesterol," provides information on the dangers of cholesterol through a series on NBC's the "Today Show," and

- the "Women's Health Campaign" began in January with activities that include TV reports, disseminating health materials and community awareness seminars.

What next? Future projects include a children's health campaign and a smoking cessation program for 1992.

AMA Works to Retain and Increase Loan Deferment

The AMA is working with specialty societies, residents, medical students and the Congress to:

- retain and increase the number of years available for deferment of loans for resident physicians to at least 3 years, and
- restore the maximum length of time for forbearance to 10 years regardless of the amount of resident's income.

Coalition letters are to be sent to the

Senate and the House requesting that both the House's H.R. 3553 bill and the Senate's S. 1150 bill contain provisions for at least a 3 year loan deferment, with no limitations and with no restrictions on forbearance.

Elimination of deferments for several different employment groups was a move to generate budget savings to fund other education programs.

AMA Confronts Epidemic of Family Violence

More than 2 million cases of child abuse and neglect are reported each year. Each year, as much as 3% of the elderly population is abused. According to a recent article in the *Journal of the American Medical Association*, domestic violence is the single largest cause of injury to women in the U.S.: more common than car accidents, muggings and rape combined. Other forms of family violence, including sexual abuse and mistreatment of the elderly, have barely been addressed.

Conservative estimates put the annual medical costs of family violence at \$44 million — the equivalent of almost 100,000 days of hospitalizations; almost 30,000 emergency department visits; and almost 40,000 visits to a physician each year. Virtually all estimates indicate that the problem continues to grow.

The AMA has declared a new initiative against family violence by launching its national Campaign Against Family Violence to provide physicians with specific, practical education on the diagnosis of violence-related problems, and the counseling and treatment of these victims.

Physicians are the key to ending the cycle of violence. They are the people in a position to identify victims and potential victims of abuse, to make sure victims receive treatment, and most important, make sure the violence is not repeated.

Robert E. McAfee, MD, the AMA's associate vice chairman, said 570,000 physicians will receive letters from the AMA urging them to join the Physicians' Campaign Against Family Violence. "We want an expression of support for the program from every physician regardless of specialty," he said. The campaign will show us how to learn from each other, to start programs in our communities and to lobby for state legislation to finance agencies which will support our efforts. Responses will impact the AMA's guidelines on family violence due to be released in January, 1992.

AMA guidelines, developed for primary care physicians, will help physicians recognize abuse from a list of warning signs, question patients in a caring way and refer them to social service agencies or shelters for legal aid or counseling support.

With the help of the AMA Auxiliary, the AMA plans to develop comprehensive directories of local agencies to which physicians can refer these victims.

Currently, abuse victims can get help through the 24-hour National Domestic Violence Hotline at 1-800-333-7233, or by writing the Council on Battered Women, P.O. Box 54383, Atlanta, GA 30308.

The AMA, involved in this issue since 1982, has gone beyond recommending national policy. Recent activities include national conferences on child abuse and neglect, and on the prevention of family violence. AMA research and reports examine child, sexual and elder abuse, missing and exploited children and child pornography. Upcoming anti-violence AMA projects include:

- the AMA national family violence prevention resource center assembling research and resources for health care providers,
- surveying of physicians and public attitudes and knowledge about family violence to establish a baseline against which to measure the success of AMA anti-violence efforts,
- promoting research on violence as a public health problem, and
- influencing public policy regarding violence treatment and prevention.

AMA member Kevin Fullin, MD, of Kenosha, Wisconsin, featured in our national promotions and who established the first Domestic Violence Advocate Program in his state, says: "Being a patient advocate is what being a physician is all about."

MEDICAL AND CHIRURGICAL FACULTY
OF THE STATE OF MARYLAND
1211 CATHEDRAL STREET
BALTIMORE, MARYLAND 21298-2917

We Need A Doctor In The House

When the Maryland General Assembly convenes in Annapolis for its 1992 session, the Medical and Chirurgical Faculty will be there. Since 1964, Med Chi has staffed the first aid facility operated during the 90-day legislative session. Come join us at the state capitol building, see the laws being made first hand. One doctor a day is all that is needed to care for the public, the legislators, and their staffs. Take advantage of the opportunity to donate something priceless, your time.

Please detach the postcard located at the top of this page, fill it out and mail it. A confirmation card will be sent to you explaining the details. You will be carrying on a tradition established by the medical community for the people of Maryland.

Doctor of the Day 1992

Note: All Monday dates are evening sessions, beginning at 4:00 p.m. and ending at 9:00 p.m. For more information, call Bernadette LaRue at Med Chi's Legal Department, 301-539-0872 or call toll free in Md. at 1-800-492-1056.

Your time can make a difference.

Performing Arts Medicine:

ISSUES IN
DIAGNOSIS AND MANAGEMENT

Are you a primary care physician who sees a few performers? Or do you specialize in the care of musicians and dancers? Maybe you are an allied health care professional or performer yourself who would benefit from our sessions. If you are, plan on attending the Medical and Chirurgical Faculty's conference on Friday and Saturday, January 24 and 25, 1992 at the Med Chi Faculty Building 1211 Cathedral Street Baltimore, Md.

Speakers will include Dr. Hunter Fry, an Australian expert in overuse injuries. Dr. Fry has shown continued interest in the growth of arts medicine in Maryland.

Other speakers include:

David Sternbach, L. C. S. W.; Richard Norris, M. D.; and committee members Emidio Bianco, M. D.; Sandra Bishop; Scott Brown, M. D.; Ruth Drucker; David Fetter; Norman Rosen, M. D.; Leo Rozmaryn, M. D.; and Charles Silberstein, M. D.

Medical
and Chirurgical Faculty
of Maryland

Medical and Chirurgical Faculty's Committee on Medicine and the Performing Arts Conference

Friday & Saturday January 24 & 25, 1992

Med Chi Faculty Building
1211 Cathedral Street Baltimore, Md

Topics to be covered include:

- Soft tissue and overuse injuries of instrumentalists
- Epidemiology of performance related problems
- Approach to the performing artist as a patient
- Medicolegal issues in the performing arts
- Medical problems in the training of the young dancer
- Prevention and treatment of performance anxiety
- Orthotics and instrument adaptations
- Myofascial pain syndromes in the musician

There will be a panel of professional musicians covering the fields of classical, jazz, and rock music who will discuss and respond to questions regarding the musician's role in society and special career demands in their particular area. Three concurrent roundtables covering vocal medicine, dance medicine, and instrumentalists' problems will include case presentations by local experts. Steve Turley, a guitarist from Peabody Conservatory, will give a short lecture-concert.

The conference will run from approximately 12:30 to 5:00 p.m. on Friday and 8:30 a.m. to 5:00 p.m. Saturday.

The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

"I have never gotten used to people dying. And I don't want to get used to it."

Dr. Aliza Lifshitz, Internist, Los Angeles, California, Member, American Medical Association

Patients come to physicians for many reasons. Beyond relief from pain, they seek compassion, empathy and support. AIDS patients receive all of these and more from Dr. Aliza Lifshitz.

Born and raised in Mexico and educated at one of Mexico City's finest medical schools, Dr. Lifshitz now serves the Hispanic community in Southern California. Over a third of her patients have tested HIV positive. Most live below the poverty level. Many are illegal aliens.

"I never forget what it means to be a doctor, and what it means is embodied in the Principles of Medical

Ethics of the American Medical Association (AMA)," states Dr. Lifshitz.

You are invited to join Dr. Lifshitz and to join with her in her efforts to bring quality health care to those in need. Become a member of the American Medical Association today.

Members of the AMA are encouraged to join their state, county and specialty societies.

Speak Out on Consultation

Consultation, a twice-weekly radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation weekly:

Consultation "LIVE"

An hour-long *live* program
Airs Sunday from 2:00 to 3:00 p.m.
Broadcast across the country
Call-in format: Physician answers questions from listeners

Consultation "PRETAPED"

A half-hour *pretaped* program
Airs Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below. Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

For excellent response in the treatment of
duodenal ulcers...

AXID[®] nizatidine

has the right answers

- Rapid epigastric pain relief^{1,2*}
- Fast and effective ulcer healing^{2,3,4}

AXID
PASSES THE ACID TEST

*Most patients experience pain relief with the first dose.
See adjacent page for references and brief summary
of prescribing information.

AXID® (nizatidine capsules)

Brief Summary Consult the package insert for complete prescribing information.
Indications and Usage: 1. Active duodenal ulcer—for up to 8 weeks of treatment. Most patients heal within 4 weeks.

2. Maintenance therapy—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than 1 year are not known.

Contraindications: Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H₂-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H₂-receptor antagonists.

Precautions: General—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.
3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix® may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chlorazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events were due to the drug.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L). The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of androgenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H₂-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H₂-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis does not substantially increase clearance of nizatidine due to its large volume of distribution.

Maryland Metabolic Institute Announces Their New Location and Continuation of Services

A new strategy to improve patient care

*We help the physician
by helping the patient
help themselves*

Health can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

Training Programs Include:

Diabetes Education

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

Behavior Modification

- weight reduction and maintenance
- modified fasting: Optifast
- limited diets: Optitrim
- full food control: LEARN®
- stress management

Dietary Counseling

- all medical disorders

Call for an appointment or further information or have patients schedule a consultation.

We pay attention to every detail.

With today's advanced medical technology, we're able to produce diagnostic images of remarkable complexity, clarity and detail. Which is why our head and body MRI imaging services are so valuable to you and your patients.

Magnetic Imaging of Baltimore's (MIB) dedicated radiologists and staff provide your patients with the care and experience you expect. We are able to schedule your patients within 24 hours of their request at our convenient location on the campus of Greater Baltimore Medical Center.

At Magnetic Imaging of Baltimore, we realize what a difference the details can make. So take a closer look. You might discover something your patients should know about.

Our Members Are Not Dying For A Free Tail.

Strangely enough, some companies are trying to sell Maryland physicians a professional liability policy that requires them to die or become permanently disabled in order to get a free tail. At Medical Mutual, our members can get a free tail while they are very much alive.

We make the tail available at no extra cost for those of you who are planning to retire from the practice of medicine after five consecutive years on our claims made and/or occurrence policy. If retirement is not in your plans, our tail is free at any age after 15 consecutive years on our claims made policy. As an added feature, you may step down from a higher rated specialty to a lower rated one with no tail charge for making the change.

Your broker or our Member Services Representatives can answer your questions about tail provisions for Medical Mutual members.

Of course, we also give a free tail in the event of your permanent disability or death.

We just don't think this should be your only choice.

- George S. Malouf, Sr., M.D.—Recipient of the American Medical Association's Benjamin Rush Award for Citizenship and Community Service129**

Betsy Newman

"The American Medical Association recognizing me, a foreign medical graduate, for this prestigious award, could only happen because we live in America. I came to this land with dreams, but I never dreamt of a moment like this."

- Access to early cardiac care: Chest pain as a risk factor for heart attacks, and the emergence of early cardiac care centers133**

Raymond D. Bahr, M.D.

The tremendous advances in cardiac patient care are not being delivered to the majority of patients because the patients are entering the system too late and are not taking advantage of prodromal symptoms. Chest discomfort must be promoted as a risk factor and emergency room programs developed whereby patients can be checked out and treated early.

- The relationship of maternal race and insurance status to prenatal ultrasound use in a national population139**

Ronald G. Kaczmarek, M.D., M.P.H.; Roscoe M. Moore, Jr., D.V.M., Ph.D., D.Sc.; and Rosalie A. Bright, Sc.D.

Data from the first group of respondents (N=4,846) of the 1988 National Maternal and Infant Health Survey were analyzed. After controlling for potentially confounding factors, such as maternal age, in a multivariate analysis, no relationship could be demonstrated between insurance status or race, and the probability of receiving a prenatal ultrasound examination.

- Thalassemia screening in Baltimore145**

Allen D. Schwartz, M.D. and Ruth E. Luddy, M.D.

An education and screening program for β -thalassemia was offered to members of the Greek and Italian communities in the Baltimore area to allow for educated decisions regarding childbearing. Similar programs have been effective in decreasing the incidence of β -thalassemia major in other countries.

- Merkel cell carcinoma of the eyelid: A report of two new cases and a review of the literature149**

Howard L. Cummings, M.D. and W. Richard Green, M.D.

Merkel cell carcinoma is a cutaneous neoplasm that rarely occurs in the eyelid. The tumor has an aggressive nature with high local recurrence and metastases rates. Early diagnosis and prompt complete excision with frozen section monitoring of margins are recommended.

Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

WHY SHOULD YOU REFER CHILDREN AND ADOLESCENTS WITH SPINA BIFIDA TO CUMBERLAND HOSPITAL?

Cumberland Specializes in Child and Adolescent Care

Each year, some 200 pediatric patients ages 2-22 needing rehabilitation and behavior management are admitted to Cumberland Hospital for Children and Adolescents. While many hospitals provide excellent medical treatment, Cumberland adapts its programs to meet the social and psychological needs of young people.

Treatment is often incorporated into traditional adolescent activities. For example, treatment may include a basketball or volleyball game played in the gymnasium or the swimming pool. Individual mobility goals may be tested and explored during an outing to one of the local parks such as Busch Gardens (amusement park), Jamestown, Yorktown or Williamsburg.

For the young person with spina bifida, there is always a new challenge and a new opportunity to stretch his or her abilities and confidence.

Functional Mobility and Independence

The most visible and often most emotionally charged issue for the young person with spina bifida is mobility. Almost all children with spina bifida wear orthoses, and many use wheelchairs. Ambulatory skills are often achieved late and tend to reach a maximum in the 5- to 8-year-old age group.

With the approach of adolescence, there are increases in weight and height that make ambulation more difficult and less cosmetic.

Difficult decisions must be made regarding the young person's future. Cumberland assists patients and their parents in determining the form of mobility that is most acceptable to them, and help them structure their lives accordingly.

Adolescence is also a time when all young people begin to become independent, and independence for the young person with spina bifida means they take responsibility for their bowel and bladder program and for donning and doffing their braces.

Cumberland evaluates the gross and fine motor skills of the patients as well as their level of intellectual functioning. This information is needed to assist patients and their parents in setting reasonable expectations. Behavior and therapy programs are structured around these expectations.

Cumberland Is A Hospital

Cumberland is licensed by the Commonwealth of Virginia and accredited by the Joint Commission on Accreditation of Healthcare Organizations. It is one of only a few hospitals in the United States where all the physicians on the admitting staff are Board Certified in their specialty.

Cumberland Doesn't Look Like a Hospital

The hospital looks more like a small college with buildings connected by sidewalks, and picnic tables and recreation facilities are disbursed among the facilities. It is common to see young people in small groups talking, studying or

listening to music. Throughout the day, they go between the dormitory, cafeteria, rehabilitation, school and other buildings.

Depending on their level of physical abilities and behavior program, the young people are given levels of independence on the campus ranging from strict one-on-one staff supervision to free movement within the immediate environment.

Young People At Cumberland Go To School

One of the most important elements in the life of a young person is school, and at Cumberland patients go to school. Integrated into the hospital campus is Cumberland Academy—a licensed private school. The building includes classrooms, a library, prevocational department and gymnasium.

Course work is obtained from each patient's home school and classes are conducted around treatment and rehabilitation programs.

Cumberland Serves Many Different Young People

Cumberland provides treatment for young people with many types of medical and behavioral problems, and this has proved to be very beneficial for the patients with spina bifida. While there are usually a number of young people in the hospital with spina bifida, there are also patients with brain injury, diabetes, seizure disorders, spinal cord injuries, asthma and other conditions.

The young people quickly develop friendships and learn about the "disabilities and abilities" of the other young people. They leave the hospital with their medical needs treated and better able to cope with problems and challenges they encounter.

Cumberland's Setting

Cumberland is located on the Pamunkey River and is part of 1,200 acres owned by the hospital. There are three large lakes on the property for fishing and boating, and miles of trails.

For more information on Cumberland Hospital or to refer a patient for treatment, please call the information office at 1-800-368-3472.

The Personality Disorder Treatment Program of Sheppard Pratt Hospital

Very often, specialized inpatient evaluation and treatment is a critical step in the effective care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Short-term and intermediate-term specialized inpatient treatment
- ☐ Extended-term intensive inpatient treatment
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychotherapy and psychopharmacology consultation
- ☐ Intensive individual and group psychotherapy provided by our staff of psychiatrists and psychologists
- ☐ Long-term treatment planning

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

(301) 938-3800
6501 North Charles Street
Baltimore, Maryland 21285-5815

Quality Service to Our Physicians and Patients!

Executive Director's Newsletter

February 1992

Committee Selection Cards 1992-1993

Med Chi members interested in serving on a Med Chi committee during the 1992-1993 committee year, should complete the committee selection card following this newsletter. All members must complete this card to be considered for appointment.

Physician Volunteers for the Board of Physician Quality Assurance Needed

Med Chi is seeking practicing licensed Maryland physicians who are interested in serving as members of the Board of Physician Quality Assurance. Med Chi is responsible for submitting a list of physicians who meet this requirement to the governor. Med Chi is soliciting for volunteers from component medical societies and is advertising in the news media for volunteers to serve on the Board.

Med Chi membership is not required for appointment to the Board of Physician Quality Assurance

If you are interested in serving on the Board, please send your curriculum vitae, no later than March 16, 1992, to: Executive Director, Med Chi, 1211 Cathedral Street, Baltimore, MD 21201-5585

For more information, contact the Executive Director's office at 410-539-0872 or 1-800-492-1056.

Living Will and Durable Power of Attorney

To assist physicians in educating patients about living wills and durable power of attorney for health care, Med Chi has developed a brochure that clearly explains the importance and appropriate use of these documents. The brochure also includes a copy of a living will and a copy of a durable power of attorney for health care which can be signed and witnessed. To order copies of the brochure, call Lori Robinson in Med Chi's Communications Department at 410-539-0872 or 1-800-492-1056 or return the order form on page 188 of this issue.

Effective December 1, 1991, the new federal Patient Self-Determination Act requires that all hospitals, nursing homes, etc. receiving Medicare and Medicaid must inform patients over the age of 18 of their right to prepare an advance directive or living will that would instruct health care providers to remove life-sustaining equipment in the event the patient becomes terminally ill. Although physicians are not subject to the provisions of the law, it is important that physicians understand the nature of both these documents.

Annual Meeting

"Mini-invasion and Megatreatments" is the theme for Med Chi's 1992 annual meeting to be held at the Omni Inner Harbor Hotel in Baltimore on Thursday, April 30, Friday, May 1, and Saturday, May 2, 1992. Referring to the use of scopes in surgical and non-surgical diagnosis and treatment, as well as massive doses of radiation, the theme encompasses a wide range of specialties and

procedures that have been enthusiastically received by patients and physicians alike. Physicians attending the meeting will have the opportunity to learn about these new technologies and earn CME credits.

Social events at the meeting include an Inner Harbor cruise with dinner and dancing aboard Baltimore's Bay Lady on Thursday, April 30. On Friday, May 1, doctors and their families will be invited to visit the new Oriole Park at Camden Yards and watch the Orioles take on the Seattle Mariners. On Saturday, May 2, physicians may attend Med Chi's Presidential Banquet honoring Med Chi President J. David Nagel, M.D.

A preliminary program listing scientific programs and registration information for the meeting will be featured in the March *Maryland Medical Journal*. For more information about the meeting, contact Vivian Smith at 410-539-0872 or 1-800-492-1056.

House of Delegates and Council Meetings

Med Chi House of Delegates and Council will meet at the following times during Med Chi's 1992 Annual Meeting at the Omni Inner Harbor Hotel in Baltimore:

Friday, April 30, 1992

Council 8:30 a.m.

House of Delegates 9:30 a.m.

Saturday, May 2, 1992

House of Delegates 2:00 p.m.

Council 3:00 p.m.

President's Regional Conference —Southern Maryland

The President's Regional Conference for southern Maryland will be held on Tuesday, March 10, 1992, at 4:30 p.m. at the Solomons Island Holiday Inn. The program will feature updates on important Med Chi issues and a presentation on the AMA's Health Access America; CME credits will be offered. Watch the Executive Director's Newsletter for more information about this conference or contact Betsy Newman, public relations director, at 410-539-0872 or 1-800-492-1056.

InforMed Program

For several years, Maryland law has required that hospitals in the state submit patient discharge data to the Health Services Cost Review Commission (HSCRC), the agency that sets rates for Maryland hospitals. Because these data provide sensitive information regarding physician practice patterns, individual physicians are not identified except through a unique number assigned by Med Chi. Last year, Med Chi received a large number of requests from physicians to release the confidential identifying number to an organization known as Barton-Gillett Physician Services. At first, Med Chi refused to comply with the release requests because Med Chi was not convinced that disclosure was either allowed by law or in the best interests of the medical community.

Since then, Med Chi leadership has met with representatives of the HSCRC and of Barton-Gillett, and has agreed to provide the identifier number upon proper request by physicians who wish to participate in Barton-Gillett's InforMed Program. In return, Med Chi has been given assurances that Barton-Gillett is not owned by any third-party payor and that it will protect the sensitive data from improper disclosure. As explained by Barton-Gillett, InforMed is a volunteer medical accounting program that will show individual physicians how their practice patterns compare with statewide and regional averages in the same specialties. Med Chi believes that this type of information may be valuable to a physician in managing his or her own practice in a cost-effective manner without sacrificing quality of care. In fact, access to such data through InforMed may also assist the physician in dealing with third-party payors. For further information on Med Chi's position on InforMed, contact Med Chi's legal department at 410-539-0872 or 1-800-492-1056.

Doctor/Lawyer/Teacher Partnership

On February 4 to April 10, 1992, physician volunteers will visit more than 30 Baltimore city schools and talk to over 2,500 students about the medical dangers of using alcohol and drugs. If you are interested in volunteering for this program in Baltimore city or if you would like information about doctor/lawyer programs in your area, contact Betsy Newman, public relations director, at 410-539-0872 or 1-800-492-1056.

Murray Promoted to AMA Vice-president

Michael A. Murray, who served as assistant executive director of Med Chi for a number of years before joining the American Medical Association (AMA) staff in March 1990, recently was made AMA vice-president for state and county relations. In this new capacity, he will be responsible for managing liaison activities involving the AMA and all state and county medical societies. Most recently, Murray assisted Med Chi in obtaining two grants to promote AMA's Health Access American program in Maryland. Med Chi congratulates Mike on his continuing success at the national level.

Computers in the Medical Office

Med Chi's Computers in Medicine Committee is sponsoring "Computers in the Medical Office," a three-part seminar on Saturday, March 7, 1992, from 9 a.m. to 2 p.m. in the Med Chi Faculty Building. The seminar is intend for physicians who want to expand their office computer capabilities or for doctors who do not yet have computer equipment and need guidance in the selection of hardware and software.

The first part of the seminar will review computerizable office functions and various examples of software that will meet those functions. The second part of the seminar will address the hardware requirements as determined by needed software and practice

size. The third part of the seminar will be hands-on demonstrations of computer equipment by all participants. Registration for the seminar is \$20. For more information, contact Bruno Mattiello at 410-539-0872 or 1-800-492-1056.

Angelo J. Troisi, F.A.C.H.E.
Executive Director

Each year Med Chi requests physicians to serve on its more than 45 committees. These committees are the backbone of our organization and guide the decisions made by Med Chi's House of Delegates, Council and Executive Committee. To assure that Med Chi remains a strong and active organization, it is essential that physicians participate as active members of these committees.

As President for 1992-93, I intend to appoint as many physicians as possible to committees. Please indicate your willingness to serve by checking your preference and special interests on the attached reply card. Every effort will be made to appoint you to the committee of your choice.

Med Chi is your organization. By serving on a Med Chi committee, you can help protect and improve Maryland medicine.

Thank you for your assistance

Jose M. Yosunico MD
President-elect

I am interested in serving on the following Med Chi committee(s):

The recommended starting dose for Calan SR is 180 mg once daily. Dose titration will be required in some patients to achieve blood pressure control.

A lower initial starting dosage of 120 mg/day may be warranted in some patients (eg, the elderly, patients of small stature).

Constipation, which is easily managed in most patients, is the most commonly reported side effect of Calan SR.

BRIEF SUMMARY

Contraindications: Severe LV dysfunction (see *Warnings*), hypotension (systolic pressure < 90 mm Hg) or cardiogenic shock, sick sinus syndrome (if no pacemaker is present), 2nd- or 3rd-degree AV block (if no pacemaker is present), atrial flutter/fibrillation with an accessory bypass tract (eg, WPW or LGL syndromes), hypersensitivity to verapamil.

Warnings: Verapamil should be avoided in patients with severe LV dysfunction (eg, ejection fraction < 30%) or moderate to severe symptoms of cardiac failure and in patients with any degree of ventricular dysfunction if they are receiving a beta-blocker. Control milder heart failure with optimum digitalization and/or diuretics before Calan SR is used. Verapamil may occasionally produce hypotension. Elevations of liver enzymes have been reported. Several cases have been demonstrated to be produced by verapamil. Periodic monitoring of liver function in patients on verapamil is prudent. Some patients with paroxysmal and/or chronic atrial flutter/fibrillation and an accessory AV pathway (eg, WPW or LGL syndromes) have developed an increased antegrade conduction across the accessory pathway bypassing the AV node, producing a very rapid ventricular response or ventricular fibrillation after receiving I.V. verapamil (or digitalis). Because of this risk, oral verapamil is contraindicated in such patients. AV block may occur (2nd- and 3rd-degree, 0.8%). Development of marked 1st-degree block or progression to 2nd- or 3rd-degree block requires reduction in dosage or, rarely, discontinuation and institution of appropriate therapy. Sinus bradycardia, 2nd-degree AV block, sinus arrest, pulmonary edema and/or severe hypotension were seen in some critically ill patients with hypertrophic cardiomyopathy who were treated with verapamil.

Precautions: Verapamil should be given cautiously to patients with impaired hepatic function (in severe dysfunction use about 30% of the normal dose) or impaired renal function, and patients should be monitored for abnormal prolongation of the PR interval or other signs of overdosage. Verapamil may decrease neuromuscular transmission in patients with Duchenne's muscular dystrophy and may prolong recovery from the neuromuscular blocking agent vecuronium. It may be necessary to decrease verapamil dosage in patients with attenuated neuromuscular transmission. Combined therapy with beta-adrenergic blockers and verapamil may result in additive negative effects on heart rate, atrioventricular conduction and/or cardiac contractility; there have been reports of excessive bradycardia and AV block, including complete heart block. The risks of such combined therapy may outweigh the benefits. The combination should be used only with caution and close monitoring. Decreased metoprolol and propranolol clearance may occur when either drug is administered concomitantly with verapamil. A variable effect has been seen with combined use of atenolol. Chronic verapamil treatment can increase serum digoxin levels by 50% to 75% during the first week of therapy, which can result in digitalis toxicity. In patients with hepatic cirrhosis, verapamil may reduce total body clearance and extrarenal clearance of digoxin. The digoxin dose should be reduced when verapamil is given, and the patient carefully monitored. Verapamil will usually have an additive effect in patients receiving blood-pressure-lowering agents. Disopyramide should not be given within 48 hours before or 24 hours after verapamil administration. Concomitant use of flecainide and verapamil may have additive effects on myocardial contractility, AV conduction, and repolarization. Combined verapamil and quinidine therapy in patients with hypertrophic cardiomyopathy should be avoided, since significant hypotension may result. Concomitant use of lithium and verapamil may result in a lowering of serum lithium levels or increased sensitivity to lithium. Patients receiving both drugs must be monitored carefully. Verapamil may increase carbamazepine concentrations during combined use. Rifampin may reduce verapamil bioavailability. Phenobarbital may increase verapamil clearance. Verapamil may increase serum levels of cyclosporin. Verapamil may inhibit the clearance and increase the plasma levels of theophylline. Concomitant use of inhalation anesthetics and calcium antagonists needs careful titration to avoid excessive cardiovascular depression. Verapamil may potentiate the activity of neuromuscular blocking agents (curare-like and depolarizing); dosage reduction may be required. There was no evidence of a carcinogenic potential of verapamil administered to rats for 2 years. A study in rats did not suggest a tumorigenic potential, and verapamil was not mutagenic in the Ames test. Pregnancy Category C. There are no adequate and well-controlled studies in pregnant women. This drug should be used during pregnancy, labor, and delivery only if clearly needed. Verapamil is excreted in breast milk; therefore, nursing should be discontinued during verapamil use.

Adverse Reactions: Constipation (7.3%), dizziness (3.3%), nausea (2.7%), hypotension (2.5%), headache (2.2%), edema (1.9%), CHF, pulmonary edema (1.8%), fatigue (1.7%), dyspnea (1.4%), bradycardia: HR < 50/min (1.4%), AV block: total 1°, 2°, 3° (1.2%), 2° and 3° (0.8%), rash (1.2%), flushing (0.6%), elevated liver enzymes, reversible non-obstructive paralytic ileus. The following reactions, reported in 1.0% or less of patients, occurred under conditions where a causal relationship is uncertain: angina pectoris, atrioventricular dissociation, chest pain, claudication, myocardial infarction, palpitations, purpura (vasculitis), syncope, diarrhea, dry mouth, gastrointestinal distress, gingival hyperplasia, ecchymosis or bruising, cerebrovascular accident, confusion, equilibrium disorders, insomnia, muscle cramps, paresthesia, psychotic symptoms, shakiness, somnolence, arthralgia and rash, exanthema, hair loss, hyperkeratosis, macules, sweating, urticaria, Stevens-Johnson syndrome, erythema multiforme, blurred vision, gynecomastia, galactorrhea/hyperprolactinemia, increased urination, spotty menstruation, impotence.

Breast of chicken

3-oz. cooked serving
of chicken breast

Best of pork

3-oz. cooked serving
of pork tenderloin

Today's Pork: Compare it to chicken for a healthy surprise

You may not have considered pork to be a healthy choice for your patients on fat-modified diets. But today's fresh pork compares surprisingly well to chicken in total fat, saturated fat, cholesterol, and calories.^{1,2*}

Compare pork with chicken^{1,2*}

	Calories	Total Fat	Saturated Fatty Acids	Cholesterol
Chicken Breast, skinless	140	3.0 g	0.9 g	72 mg
Pork Tenderloin, trimmed	139	4.1 g	1.4 g	67 mg
Pork Top Loin Roast (boneless), trimmed	165	6.1 g	2.2 g	66 mg
Center Loin Chop, trimmed	172	6.9 g	2.5 g	70 mg
Chicken Thigh, skinless	178	9.2 g	2.6 g	81 mg

*Table refers to 3-oz. cooked servings.

New study: Pork is now 31% leaner

Pork is leaner today because of significant changes made in breeding and feeding techniques. According to new 1991 official USDA data, fresh pork sold today contains an average of 31% less fat after cooking and trimming than the same pork cuts reported in 1983.¹

Today's pork fits well within the dietary guidelines recommended by both the American Heart Association and the National Cholesterol Education Program. Here's some advice to help patients on low-fat diets enjoy the variety, extra taste, and versatility of pork:

- Choose the leanest cuts. Shop for cuts with "loin" in the name.
- Trim away any visible fat.
- Keep portions moderate (about 3 oz, cooked).
- Prepare by broiling or roasting, and avoid additional fat in preparation.

George Atwood can't get enough of life. Five years ago he lost all but four inches of his small intestine. And it seemed the days of tramping about his beloved mountains and streams were over.

But the fighter in George Atwood would have none of it. Under the supervision of his physician, Dr. James Mullen, George began Total Parenteral Nutrition through Caremark Homecare.

Although he now "eats" through an intravenous feeding pump, this rugged, independent-minded outdoorsman hasn't lost his appetite for the things that make life worth living. Like being first into the fields on opening day of pheasant season. Or up at dawn to wrestle an ornery mountain pike on a brisk fall morning.

In fact, about the only thing he regrets is having to sit still while infusing. And for George Atwood, that's the hardest part of all.

Caremark Homecare. Because life should be worth living.SM

CAREMARK

Affiliate Baxter Healthcare Corporation

Prescribed Just For You.

The AMA Auxiliary Member VISA® Card.

Now there is an extra special benefit to being an AMA Auxiliary Member. Your very own VISA card with some healthy advantages prescribed to enhance your lifestyle.

If you like, you can even take this opportunity to establish credit in your own name.

For openers, the \$20 annual membership fee has been waived for a full year. And there's no fee for additional cards.

With your new AMA Auxiliary Member VISA Card, you may apply for a 5% refund on hotel and travel expenses when you make your reservation through the Travel Center.

Enjoy a 25-day grace period on all your retail purchases when the previous balance has been paid in full.*

Rest easy on the road with \$100,000 personal traveler insurance

and access to worldwide emergency cash up to \$500.

Give yourself the total convenience of Direct Access Checks, ATM access to more than 20,000 PLUS SYSTEM® and VISA® Network locations throughout the world, a Customer Service Hotline, and much more.

What's more, you get all of these special benefits at a very competitive cost, just 17.9% ANNUAL PERCENTAGE RATE (APR).*

So why settle for just any credit card? Call 1-800-456-6648 today for your application and complete information. The AMA Auxiliary Member VISA Card. Taken daily, it will do you a world of good.

*If your account had no previous balance, there is no finance charge on purchases paid in full within 25 days from the date they are posted to your account. We will charge you Finance Charges on your purchases if you do not pay your account balance in full every month. We figure the Finance Charge on purchases by applying the monthly periodic rate of 1.49% (corresponding ANNUAL PERCENTAGE RATE of 17.9%) to your average daily balance. To get the average daily balance, we add up all debits to your account balance each day and subtract all credits. At the end of the statement cycle, we average the daily balances and apply the monthly periodic rate. We will charge you Finance Charges on your cash advances from the date of each cash advance transaction. There is no "free ride" period on your cash advance account. We figure the Finance Charge on cash advances by applying the daily periodic rate of 0.049% (corresponding ANNUAL PERCENTAGE RATE of 17.9%) to the average daily balances of your cash advances. To get the average daily balance, we take the beginning balances each day, add all advances, and subtract all credits. At the end of your billing cycle, we add up all daily balances and divide by the total number of days in the billing cycle. This gives us the average daily balance. There is a \$0.50 minimum Finance Charge on your account each month any Finance Charge is due. Approval of your application will be subject to income and credit approval criteria.

Auxiliary

Breast cancer awareness

The Auxiliary's fall house of delegates meeting was held in October, which happens to be Breast Cancer Awareness Month. President Vivian Lynn has made breast cancer the focus for the Auxiliary and the special topic for Health Projects. The fall meeting was held in Harford County and the principal speaker on the first day was Auxilian Bea Sadowsky (Mrs. Wallace) from Harford County, who spoke about her work with "Reach to Recovery." She brought us many insights gained in the 25 years since her own surgery. "Reach to Recovery" is an outreach program sponsored by the American Cancer Society for post-mastectomy patients. Women, who have been through this experience, bring patients a special bag of useful gifts and materials, and are available to talk, explain, and help patients during their recovery (Figure 1).

On the second morning of the meeting, Dr. Faysal Mudarris, a Harford County radiologist, presented a slide show on mammography. He explained what the radiologist looks for, discussed the technology involved, and reinforced the need for regular testing in all women.

Ms. Patti Wilcox, RN, director of the Johns Hopkins Oncology Consultation Unit, was the luncheon speaker. Ms. Wilcox has had many years of experience through teaching, counseling, and offering support to women who have had breast cancer. She gave specifics on self-examination (Figure 2) and provided special information for women in

HOW TO EXAMINE YOUR BREASTS:

1 IN THE SHOWER:
Examine the entire area of each breast in the bath or shower, since fingers glide more easily over wet skin. Check for any lump or thickening.

2 BEFORE A MIRROR:
Inspect your breasts first with arms overhead, and then by placing hands on hips and flexing your chest muscles. Look for any changes, i.e., dimpling or swelling.

Figure 1. Beatrice Sadowsky of Harford County holds a "Reach to Recovery" bag filled with useful gifts and materials.

high-risk families. Through the use of videos and slides, she presented a very clear and informative talk. Ms. Wilcox may be reached at the Johns Hopkins Oncology Consultation Unit, 550 North Broadway, Suite 1003, Baltimore, MD 21205 (410-955-4850).

Materials from the Cancer Information Service were distributed (Figure 3) and videos from the American Cancer Society, Maryland Division, were shown.

Figure 3. Participants at the October meeting were provided with free materials from the Cancer Information Service.

3 LYING DOWN:
To examine your right breast, place a pillow or folded towel underneath your right shoulder and place your right hand behind your head. With fingers flat, press each breast in small, circular motions around an imaginary clock face. Repeat for the left breast. Then, squeeze each nipple. Any discharge should be promptly reported to your physician.

IT'S WHAT'S BEHIND A LUXURY HOME THAT COUNTS.

River Falls
Potomac's Family Community

Look behind the glitz for the hidden values. Quality construction that saves you time, trouble and money through the years.

For example, I take extra steps to give you a dry basement. I start with a yard graded to carry water *away* from the house. Walls get two hand-troweled layers of waterproof cement, plus another thick hand coating of tar...about six times as much as others use. Gutters are 20% wider. And *two* drainpipes are buried around your foundation, one inside and one out. I even run a drain from every window well.

Under your floors, more hidden quality. No rattling china or "spongy" floors. I use 2x10 and 2x12 joists instead of the usual 2x8s or glued-up plywood trusses. I space them closer, and double them up under walls and where heavy loads like your refrigerator sit. I also use Douglas Fir instead of ordinary pine because it's straighter and stronger.

A few years from now, when owners of other so-called luxury homes are rebuilding, repairing and replacing, you'll see what I mean. It's not just what's behind your home that makes the difference, it's also who.

Take Beltway Carderock Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane. HOURS: 12-5 daily. PHONE: (301) 299-3700. Brokers welcome.

GOSNELL INC.
Clarence W. Gosnell, Incorporated

"My grandfather taught my father and my father taught me."

Auxiliary

Posters, newspaper clippings, and magazine articles were available to give further information. All the materials used at the meeting were obtained without charge from the American Cancer Society and the Cancer Information Service. For your convenience, information and free materials may be obtained by writing or calling the following: (a) Cancer Information Service, 550 North Broadway, Suite 307, Baltimore, MD 21205 (1-800-4-CANCER) or (b) American Cancer Society, Maryland Division, Inc., North Central Maryland area, 8219 Town Center, P.O. Box 43025, Baltimore, MD 21236 (410-823-2515 or 529-6500). All county auxiliaries are urged to take advantage of the resources of these organizations and to use them at their meetings.

The Auxiliary's focus on breast cancer will continue throughout the year. The speaker for the winter board meeting, to be held at Med Chi in February, will be Sandy Kolodny, coordinator for the University of Maryland's mammography van. This van travels to all parts of Maryland to perform low-cost or no-cost mammography examinations.

We think this emphasis on breast cancer is extremely timely and believe this is a message that will be useful to all. Vivian Lynn has chosen a direction we should all try to follow.

Health Projects Chairpersons

Venous Ulcers.

Accelerated non-surgical treatment for the most advanced cases.

The physicians at Vein Clinics of America have successfully treated venous leg ulcers—including advanced cases—in our offices without the use of surgical procedures.

Our accelerated ambulatory treatment program includes: 1) Healing the ulcer itself by daily isometric application of compression therapy; 2) Addressing the underlying cause and preventing recurrence through injection sclerotherapy of incompetent perforating veins and refluxing varicose veins.

Rapid closing of ulcer.

The common denominator of most leg ulcers is venous pump failure with edema. Our treatment first removes the edema and heals the ulcer through the application of isometric compression bandaging. This increases venous outflow during ambulation, resulting in improved pump action at the calf muscle.

Initially patients are seen daily—then less frequently. This program produces the fastest response, with extreme cases healing as rapidly as the case detailed in photos on this page. Other advantages

Before treatment. Patient shows chronic ulcer with subcutaneous tissue damage from years of inflammation.

include immediate ambulation, rapid elimination of pain and drainage and high patient acceptance.

Effective long-term healing.

Once the ulcer has healed and other problems such as edema and dermatitis are under control, the second phase of treatment can address prevailing

underlying causes. Refluxing venous trunks, tributaries and incompetent perforating veins are eliminated by injection compression sclerotherapy, often guided by Duplex Color Ultrasound.

This selective fibrosis process improves the venous pump, resulting in long-term healing and lowered recurrence of leg ulcers.

Proven treatment program with documented results.

This treatment protocol was developed over 10 years of clinical experience, with favorable results on over 200 leg ulcer patients.

Many patients had previous surgery with skin grafting and vein stripping. But our two-step protocol provided more effective healing. This is because the treatment is directed at the underlying cause, the venous pump failure.

For information on how your patients can benefit from this treatment call Louis Ivey, MD, Eastern Region Medical Director at (301) 654-6633.

After one week of isometric compression bandaging.

After two weeks.

Ulcer closed in three weeks.

One year later, following large vessel sclerotherapy.

Enter the Twelfth Annual Med Chi Photo Contest

Deadline for entries is Friday, April 3, 1992 ● Two categories: Black & White or Color ● Open to all Med Chi and Auxiliary Members ● First and Second Prizes Awarded In Each Category ● All Photographs will be displayed at the 1992 Annual Meeting at the Omni Inner Harbor Hotel in Baltimore.

Photo Contest Rules

Eligibility: All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

1. Photographs may be submitted in two categories: black and white or color.
2. Limit: three entries per person.
3. Prints only, no smaller than 8 x 10" or larger than 11 x 14", will be accepted. If your favorite shot is a slide, you must have a print made within these size ranges to enter the contest.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name, address, and telephone number attached to the back of each photograph.

6. Entries may be mailed or brought to Med Chi, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on April 3.
7. Photographs entered in the contest will be on display at the 1992 Annual Meeting.
8. Prizes will be awarded to the first and second place winners.
9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, April 30 – May 2, 1992.
10. Photographs will not be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting at noon on May 2, or at Med Chi thereafter.
11. Med Chi does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

George S. Malouf, Sr., M.D.

Recipient of the American Medical Association's Benjamin Rush Award for Citizenship and Community Service

Betsy Newman

Ms. Newman is director of public relations, Medical and Chirurgical Faculty of Maryland, Baltimore, MD.

"The American Medical Association recognizing me, a foreign medical graduate, for this prestigious award, could only happen because we live in America. I came to this land with dreams, but I never dreamt of a moment like this."

"This is a great country that we live in," says George S. Malouf, Sr., M.D., recipient of the 1991 American Medical Association's (AMA) Benjamin Rush Award for Citizenship and Community Service. Dr. Malouf received a Galvano Medallion and a \$2,500 stipend at the AMA's 1991 Interim Meeting in Las Vegas, Nevada on December 8, 1991. He is only the twentieth physician to be selected for this national award. A foreign medical graduate, Dr. Malouf feels honored to be associated with Dr. Rush, a signer of the Declaration of Independence. "To be identified with such a great American patriot and physician is certainly something of which I am very proud."

The Benjamin Rush Award

The AMA's Benjamin Rush Award is presented to physicians who have made an outstanding contribution to the community for citizenship and public service that is above and beyond the call of duty of a practicing physician. One of the most influential physicians in America from 1761 to 1813, Dr. Benjamin Rush was also known as a social reformer and citizen. He was one of the four physician signers of the Declaration of Independence, a member of the Continental Congress, physician general of the Continental Army, and a member of the Pennsylvania convention that ratified the Constitution.

Like Dr. Rush, Dr. Malouf is also a great American patriot and was singled out for this honor because of his numerous outstanding contributions to Prince George's County, Maryland, and the United States. "I believe it is very important for physicians to be aware of the needs of their community," says Dr. Malouf. "I also believe the community should be aware of quality medical care. Somehow, in all of my endeavors, I try to achieve this union."

Medicine and the community

Dr. Malouf realizes this union in his own practice. Since he opened his Hyattsville ophthalmology practice in 1958, Dr. Malouf has earned a

reputation as a caring physician and community leader. He continuously demonstrates a profound concern for all people, especially the needy.

To meet the medical care needs of the indigent citizens in rural Baden, Maryland, Dr. Malouf was instrumental in bringing Baden Health Services to its fruition. "Baden was an area in need of physicians," says Dr. Malouf. "Although I'm not from southern Maryland, I was very active in creating the board to recruit physicians to that community." He also personally met with a variety of individuals and groups, procured a site, obtained materials, and supervised the activities for this essential health service. The clinic now provides medical care to over 15,000 residents in the Baden area.

To assist the impoverished children in Prince George's County, Dr. Malouf is a trustee of the Magruder Trust which helps fund medical care for these children. He has also served as a member of the Health Planning Committee of Prince George's County and is a trustee of the Prince George's Medical Charitable Foundation.

Dr. Malouf thanks AMA President John J. Ring, M.D. for the Benjamin Rush Award.

AMA President John J. Ring, M.D., Eva Malouf, George S. Malouf, Sr., M.D.

The ecumenical principle

Dr. Malouf's activities extend far beyond the realm of the medical community. In the early 1970s, he became aware of the need to establish a church for the Lebanese Catholic community in the Washington, DC metropolitan area. "I believe in the ecumenical principle and I felt that I should help in some way," says Dr. Malouf. Dr. Malouf, who is not Catholic, dedicated an enormous amount of time, energy, and finances to establish the Melkite Catholic Church of Washington, DC. The congregation named him "Man of the Year" in 1971.

An active member in his own church, the St. George Orthodox Church in Washington, DC, Dr. Malouf has served as president and member of the council. He has been a member on the board of trustees for the Antiochian Christian Orthodox Church of America and received the Antiochian Medal of Merit in 1981.

The Lebanese war

Dr. Malouf's altruistic efforts exceed our national boundaries. Following the deaths of 242 U.S. Marines during the bombing of a marine barracks in Beirut, Lebanon, Dr. Malouf helped his wife Eva, who chaired the committee, raise thousands of dollars for the Beirut Marine Relief Fund to assist the surviving family members of the deceased Marine Corps personnel. Following this effort, the U.S. Marine Corps issued a proclamation stating its sincere appreciation for this fund. "I was very much affected by the Lebanon war and felt compelled to do something about it," says Dr. Malouf. "I felt honored in joining the committee working with the Lebanese Embassy in an effort to help many of the people who were injured."

Dr. Malouf became the focal point for physicians who graduated from the American University of Beirut, helping them find residency in the United States."

His tremendous amount of community involvement both at home and abroad has earned him numerous awards. In recognition of his close liaison and hundreds of hours of community service, the Lebanese government has bestowed on him a special decoration.

In the United States, Dr. Malouf's accomplishments have been applauded at both the county and state level. In 1984, the Prince George's County Council and the county executive issued a proclamation applauding the efforts of Dr. Malouf. Later that year, the Maryland Senate passed a resolution recognizing and congratulating him for his "outstanding dedication to the citizens of Prince George's County and for bringing great credit to the profession of medicine." In 1987, Med Chi presented him with the A.H. Robins Physician of the Year Award for outstanding community service.

Prince Georgian of the Year 1988

In April 1988, Dr. Malouf was named Prince Georgian of the Year. Selected from a field of over 200 nominees, Dr. Malouf was the first person to receive this honor for his

contributions that had a "significant impact on the lives of their neighbors and all of the residents of Prince George's County, making our communities good places in which to live and work." On April 7, 1988, the Maryland Senate again recognized him for his "outstanding accomplishments which have significantly enhanced the quality of life in Prince George's County." The Maryland House of Delegates passed a similar resolution the following day. In May of that year, he received a governor's citation for his "deep commitment to your fellow citizens of Maryland...as demonstrated by your pioneering efforts in the field of ophthalmology and your distinguished record of community service...."

The AMA's Dr. Benjamin Rush Award is the first national recognition Dr. Malouf has received for his community involvement. Upon receiving the award, Dr. Malouf presented the \$2,500 stipend check to Med Chi President J. David Nagel, M.D. The money will be used to start a foundation to provide for lectures and "other methods of sharing this great honor among the people of Maryland."

In 1987, George S. Malouf, Sr. M.D. received the A.H. Robins Award for Community Service from Ted Lewers, M.D.

Family and background

"This award is a great tribute to me and my family," says Dr. Malouf who has lived with his wife, Eva, in College Heights Estates in Prince George's County for over 30 years. They have four children: Mrs. Carol Mufarrij, George S. Malouf, Jr., M.D., Mrs. Vivian Zalzal, and Alan Malouf, M.D.

Born in Zahle, Lebanon, Dr. Malouf came to the United States after earning a doctorate in medicine from the French Faculty of Medicine in Beirut, Lebanon. After completing five years of residency training at Boston City Hospital, Dr. Malouf became a member of the American Board of Ophthalmology. He served two years in the U.S. Army Medical Corps where he earned a Certificate of Achievement for his outstanding performance, leadership ability, and professional knowledge.

Dr. Malouf now practices in Hyattsville, Maryland with his two sons and maintains a very active role in medicine. He

AMA President John J. Ring, M.D. (C) and George S. Malouf, Sr., M.D. and his wife, Eva Malouf, look on as Med Chi President J. David Nagel (R) congratulates Dr. Malouf on his receipt of the Benjamin Rush Award.

is the chief of the Division of Ophthalmology at Prince George's Hospital and Medical Center where he and George Malouf, Jr., M.D. performed the first cornea transplant in Prince George's County. He has served as president of the hospital's medical staff and now sits on the board of directors. He is the former chief of ophthalmology at Doctor's Hospital of Prince George's County. He is a member of the board of directors of Community Hospital and Health Systems of Prince George's County, which oversees the operation of the three county-owned hospital facilities. He is also a founding member of the Health Planning Committee of Prince George's County.

Dr. Malouf plays a major role in organized medicine. A member of the Prince George's County Medical Society, Dr. Malouf served as its president in 1975. At the state level, he was Med Chi Council chairperson for two consecutive years before he was elected Med Chi president in 1984; he was the

AMA President John J. Ring, M.D. (R) presents George S. Malouf, Sr., M.D. (L) with the stipend check for the Benjamin Rush Award.

first foreign medical graduate to hold that office. Dr. Malouf is currently a delegate to the American Medical Association. He is also a charter member of the Maryland Society of Eye Physicians and Surgeons where he served as its first vice-president in 1980 and became president in 1981.

To his colleagues, Dr. Malouf is known as a peacemaker—a person who can bring both sides together for a common goal. To his community, Dr. Malouf is recognized as a devoted humanitarian whose accomplishments have inspired many.

**Benjamin Rush Award
for Citizenship and Community Service
Acceptance Speech**

**by
George S. Malouf, Sr. M.D.**

**Presented at the
American Medical Association Interim Meeting
in Las Vegas, Nevada
on December 8, 1991.**

Mr. President, Mr. Speaker, members of the Board of Trustees, distinguished guests, fellow delegates: I accept this great honor, the Benjamin Rush Award, with sincere gratitude and a deep feeling of humility. I am grateful to the Board of Trustees of the American Medical Association for choosing me. Being recognized by the highest body of my peers gives me a thrill and a feeling of pride that will live with me forever.

I am also grateful to my immediate family. To my wife Eva for being a great inspiration and loving friend throughout the years. To my sons and daughters and their spouses for being always on my side, helping and cheering my efforts. I am also indebted to my extended family: the Prince George's County Medical Society and the Medical and Chirurgical Faculty of Maryland. They have provided me with love and support for the last three decades. It is for them and in their name that I accept this award.

The American Medical Association recognizing me, a foreign medical graduate, for this prestigious award could only happen because we live in America. I came to this land with dreams but I never dreamt of a moment like this.

Linking my name to that of Benjamin Rush, a member of the Continental Congress, a signer of the Declaration of Independence, a great physician, and a great American patriot, is overwhelming and humbling. Recognizing my contribution to citizenship and community service should

Yet despite his activities and honors, Dr. Malouf is humble. "This award isn't meant to symbolize what I've done," he says." This award is a symbol of the greatness of the American Medical Association and our nation. In his acceptance speech to the AMA (see box), Dr. Malouf said, "The American Medical Association recognizing me, a foreign medical graduate, for this prestigious award, could only happen because we live in America. I came to this land with dreams, but I never dreamt of a moment like this." ■

George S. Malouf, Sr., M.D. gives his acceptance speech.

be a recognition of the magnificence of the American spirit, the greatness of this nation and the everlasting solid principles on which it stands.

Yesterday the winds of freedom stormed through the world, crumbling walls built to separate nations. That same wind continues to pass over America but it turns into a gentle breeze blessing and caressing our country as we enter with more conviction and determination the third century of our history.

Whatever achievements I have attained in my life and whatever contributions I have provided are minuscule. However, Mr. President, I would like to lay them as a token "gift of gratitude on the lap" of the American Medical Association and this great nation. It is my way of saying thank you and God bless America. ■

*Quotation from Khalil Gibran. I believe in you. In: *Mirrors of the Soul*. New York: Philosophical Library. 1965; 34.

Access to early cardiac care: Chest pain as a risk factor for heart attacks, and the emergence of early cardiac care centers*

Raymond D. Bahr, M.D.

Dr. Bahr is medical director, the Paul Dudley White Coronary Care System, St. Agnes Hospital, Baltimore, MD.

The tremendous advances in cardiac patient care are not being delivered to the majority of patients because the patients are entering the system too late and are not taking advantage of prodromal symptoms. Chest discomfort must be promoted as a risk factor and emergency room programs developed whereby patients can be checked out and treated early.

Although heart attack is the nation's number one health problem, it may be possible to topple it from this lofty position in the future. Miraculous achievements have taken place in medicine in the past—witness the invention of the pacemaker. Twenty-five years ago, patients were painfully stimulated from an external source in order to stay alive, and suicide was not uncommon. Today, such patients can be treated with permanent pacemakers, be out of the hospital within several days, and receive follow-up via a telephone call. The pacemaker's life is about 10 years; when there is difficulty, programming can take place externally over the chest wall, preventing re-operation.

The secret to achieving success has to do with the learning curve. The process of learning takes place over time. Progress begets progress. Perhaps what is most important is to have a cornerstone that gets one on the path of that learning curve. Once that is accomplished, creative steps can be taken to overcome seeming resistance points, because available energy will be focused on the problem. The cornerstone then takes on a new value. It not only gets one started but opens the door for even more advances. Witness what has taken place in coronary care units over the last 25 years.^{1,2}

Before 1960, there was little physicians could do for heart attacks. Patients were kept in oxygen tents, given morphine for pain, and provided oxygen for shortness of breath. The development of cardiopulmonary resuscitation (CPR) and Hughes Day's application of this technique to the heart attack problem started the first coronary care unit. CPR was the cornerstone that got clinicians started on that learning curve. As a result, nearly every hospital in the United States now has a coronary care unit. These coronary care units have become the research benches for progressive discoveries. Drugs are now available to immediately dissolve occlusive blood clots, thus preventing heart damage. Studies have shown that the final event leading to a heart attack is a clot superimposed upon an atherosclerotic plaque. Through angiography, M. A. DeWood, M.D. has been able to show that 85 percent of heart attack patients exhibit such

*Presented May 1991 at the 193rd Annual Scientific Session of the Maryland Medical and Chirurgical Faculty—*American Medicine Today: Perspectives from Maryland*.

clots.³ In addition, when complete occlusion occurs, there is a wave front of cell death over time; if therapy is started early enough to open such vessels, the amount of damage can be minimized. As a result, mortality has been reduced in coronary care units from 30 percent to 5 percent, and perhaps even less.

Thus, thrombolytic therapy has made the management of acute myocardial infarction (MI) very promising. Studies have further shown that it is safe to give thrombolytic therapy in community hospitals. In over 200 cases using streptokinase at St. Agnes Hospital, mortality was 7 percent at discharge and 7 percent over the next five years with a complication rate of less than 1 percent. Furthermore, once thrombolytic therapy is given in a community hospital, it is not necessary to immediately rush the patient to a tertiary facility for catheterization. The recent TIMI-II B study⁴ has shown that it is not even necessary to proceed to cardiac catheterization in all patients receiving thrombolytic therapy; patients can be managed medically unless there is evidence of ongoing ischemia manifested by postinfarction angina or by a positive stress test done prior to discharge or six weeks after. If no such ischemia exists, patients managed medically have the same mortality rate as those treated aggressively with catheterization and subsequent percutaneous transluminal coronary angioplasty (PTCA) or coronary artery bypass graft (CABG). Thus, the community hospital has become a very important center for the management of the heart attack patient.

Unfortunately, not all MI patients receive thrombolytic therapy. Currently, only patients who present with ST elevations within the first six hours receive thrombolytic therapy. This amounts to about 25 percent of all MI patients. The major beneficial results, however, take place when patients are given thrombolytic therapy within the first hour of admission to the emergency room; only 10 percent of the patients in the GISSI-I study were in that group.⁵ At St. Agnes Hospital, 20 percent of the patients are in that group because of a prioritized game plan in the chest pain emergency room for heart attack patients. Delay in prehospital time appears to be the major reason for most late thrombolytic treatment. Thus, enthusiasm for this type of early cardiac care needs to be balanced by the fact that it can be applied only to a small number of heart attack patients (20 percent) and, of these, only 10 percent within the golden first hour. Therefore, a better link is needed between the community and the hospital that would reduce delay in therapy, as well as expand the capability of treating patients other than those with ST elevations (Figure 1).

Focusing on the ideal patient for thrombolytic therapy (first-hour MI patient) has, to date, been elusive. It might be compared to the golden fleece of Greek mythology—something almost impossible to capture. Presently, we are awaiting for the total occlusion of the

coronary vessel to take place and then expect rapid transport for thrombolytic therapy to be effective. The question comes up—is it possible to be involved earlier, before the occlusive event? Not only would this be an excellent strategic step, but the first-hour MI patients would be coupled with patients who do not yet have completely blocked vessels, and thus have no damage (Figure 2). Thus, a larger number of patients would be treated, and not just those with ST elevations.

Not all heart attack patients present with chest pain, and of those who do present with chest pain, not all have symptoms that would lend themselves to management at this crucial stage. However, a significant number do have chest pain and a significant number of those with chest pain do have early warning signs (stuttering chest discomfort) long before total occlusion takes place. Denial of such symptoms is common when they are mild. In a recent *JAMA* article, the author raises the question, "Is the ischemia silent or is the patient silent?"⁶ There are numerous studies that describe 40–60 percent of heart attack patients having prodromal symptoms for hours, days, or weeks prior to coming to the hospital with total occlusion (Figure 3). Thus, the best form of early cardiac care may not be thrombolytic therapy but cardioprotective

Figure 1. Improving the link between the community and the hospital can reduce delay in therapy.

Figure 2. Involvement before the occlusive event is crucial.

therapy when prodromal symptoms are present (Figure 4). Not only does cardioprotective therapy address the disease when more benefits are available to the patient, but it also

offers therapy to many more patients than can be treated with thrombolytic therapy alone. The real question is whether prodromal symptoms can be identified, recognized, and acted upon in the community hospital.

Twenty years of rounds in coronary care units have convinced me that these prodromal symptoms are real and are not a fluke.⁷ However, once when a patient did come in early, a nurse asked him, "What possessed you to come in early?" as if it were unnatural to do so. Perhaps the delay in seeking treatment is due to the tremendous resistance and rationalization that take place early, when symptoms are minimal. It is only when severe pain occurs or a "Mack truck" is sitting on the chest, that patients feel they need to call 911 or be seen in the hospital. Unfortunately, this is probably one of the reasons why heart disease remains our number one health problem—we just don't act early enough.

With all this knowledge, one would think that chest pain or the delay in seeking attention when chest pain starts would be included with other risk factors such as cigarette smoking, hypertension, and cholesterol. National awareness programs exist for all of those risk factors, but not for chest pain. Yet, when meaningful chest discomfort does start, a patient is more at risk for sudden death than by having an elevated cholesterol level or a history of cigarette smoking. When a heart attack does take place, it is not what got the patient to that point that is important, but what is done once the cardiac symptoms start to manifest themselves. Thus, the more important risk factor or final risk factor is chest pain or the chest discomfort syndromes.

Chest pain may not always be very painful or strangulating. Early on, it may exist as a mild discomfort, centrally located, that comes on with activity and is relieved by rest (stuttering); it is easily put off because symptoms are mild. It is difficult to talk such patients into having these symptoms checked-out, especially when the patient has many things to do. Yet it's necessary if we are to have an impact on this major health problem.

Chest pain appreciation is needed to get us on a learning curve for community activation. Once we start on this learning curve, progress will beget progress and we will develop creative ways to deal with obvious problems, such as gridlock and saturation in the emergency medical system and emergency rooms. It will become increasingly important to have a place within the hospital to check-out patients with early symptoms and to establish a community outreach program that can help promote this effort (i.e., early cardiac care centers).^{8,9}

The question may arise whether such a private sector effort of early cardiac care centers can be started in all American communities. Is there a precedent? Yes—coronary care units did not always exist. They began in the late 1960s. Once it made sense to have such a unit, many hospitals started them up. When a critical number

Figure 3. Many patients have prodromal symptoms long before coming to the hospital with total occlusion.

Figure 4. When prodromal symptoms are present, cardioprotective therapy may be more important than thrombolytic therapy.

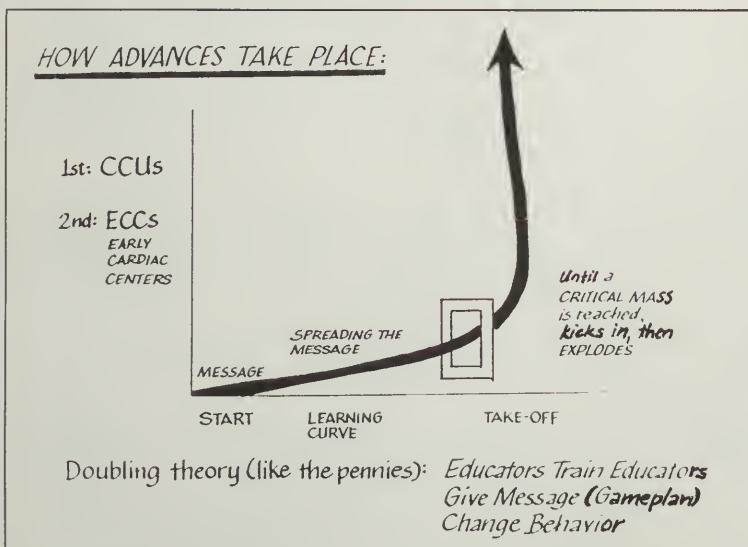

Figure 5. As an idea catches on, growth increases dramatically.

of coronary care units were reached (approximately 250), exponential growth took place whereby virtually every hospital in the United States during the ensuing years developed a coronary care unit (Figure 5). The concept of early cardiac care centers or chest pain emergency rooms may do likewise. Thus far, there are 124 chest pain emergency rooms in 35 states—an increase of 21 and two, respectively, in just the past two months. Another 70 hospitals have expressed interest in starting such units. The Health Care Advisory Board in Washington, DC has recommended the chest pain emergency room concept to its 500 members as a major strategic step in cardiology for the 1990s. It makes sense to do this for many reasons, but most importantly, it represents a private sector effort in the fight against heart disease.

The community hospital has become a key in this success

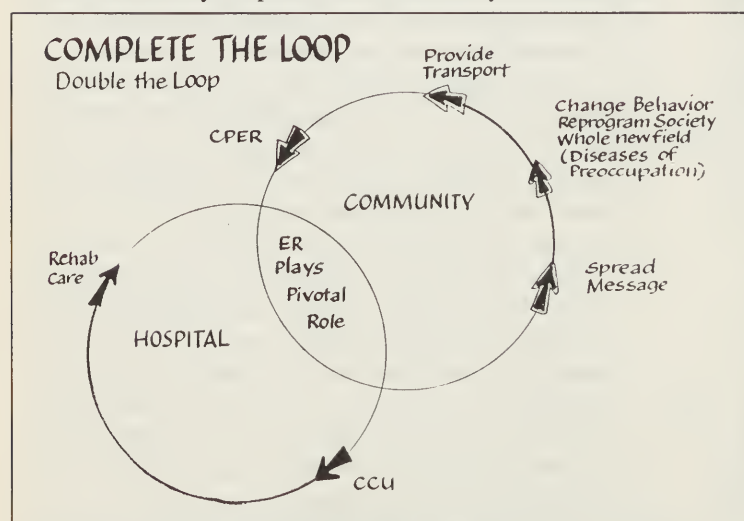

Figure 6. Increasing patient awareness of chest pain as a risk factor can enhance the delivery of care.

story. Not only is it recognized that thrombolytic therapy and cardioprotective therapy are best accomplished at this level, but patients do not have to be rushed to tertiary care centers unless ongoing ischemia is present. However, the real problem involves the delivery system and how to expand it to include all patients. Coronary care units grew rapidly when common sense prevailed, long before scientific data were available to show the units' worth. The value-added aspect of CPR in getting these units started cannot be underestimated. So too, promoting chest pain as a risk factor through a national awareness program similar to those conducted for other major risk factors, would get us started on bringing about a community game plan designed to enhance the delivery phase (Figure 6). To date, this has not taken place because the Public Health Service and the National Heart,

Lung and Blood Institute have been concerned about possible problems with this approach. However, there is now a consensus for a National Heart Attack Alert Program scheduled to have begun in the summer of 1991.¹⁰

The problem with this approach is that it focuses primarily on the professional. Only years later, when the scientific database is developed, will the information get to the public. This process is very slow, entailing endless consensus conferences and agreements—paralysis by analysis. A more rapid approach would have community hospitals pushing for early public involvement in increasing awareness that heart attacks have beginnings (prodromal symptoms) and that early intervention amounts to prevention of sudden death and damage to the myocardium (Table).

The heart attack problem has been the number one killer of the adult population since the turn of the cen-

Table. Awareness programs for the heart attack problem

	NIH (NHLBI)	The Early Cardiac Care Program (St. Agnes)
1. Program	National Heart Attack Alert Program (NHAAP)	National Chest Pain Awareness Program
2. Emphasis	Emphasis is on detecting heart attack early so as to reduce delay outside the hospital. Get heart attack victims into the system quickly.	Emphasis is on early detection out in the community through increased recognition of anginal equivalents and prodromal symptoms. Reawakening awareness.
3. Present focus	Initially, focus is on the professionals, with a heightened awareness for the problem of time delay.	Focus is primarily on the public, including the educational system, community leaders, hospital administrators, ER physicians, and cardiologists
4. Behavioral changes	When victims are experiencing heart attack symptoms, there should be an all out effort to get the victim quickly into the system.	Change behavior when heart attacks are beginning. It is important to understand the reasons for delay and to resolve them. There is an effort to understand the dynamics of the beginning heart attack. Plans can be worked out to correct the public's misconceptions.
5. Action	Call 911 and the emergency medical system. (Emergency rooms, unfortunately, are not all created equal, and display a mixture of responses to such incoming patients.)	Make a real effort to provide user-friendly reception for those who come in with minimal symptoms, so as to create a sliding effect into the hospital for these early patients.
6. Gameplan	Same as awareness programs for cigarette smoking, cholesterol, hypertension, etc.	Anticipate rapid growth as demonstrated by the exponential growth of CCUs. Use the power of "an idea whose time has come." When a critical number are achieved, see if there is an explosion in the number of units nationwide.
7. Primary goals of therapy	Thrombolysis: ASA, thrombolytic agents, heparin.	Cardioprotection: ASA, beta and calcium blockers, nitrates, heparin, xylocaine.

ture. No one can remember it ever being out of first place. Heart attack can be removed from its number one position before the year 2000 if widespread community hospital participation can be recruited.¹¹⁻¹³

Access to early cardiac care: A commentary

In this issue of the *Maryland Medical Journal*, Dr. Raymond Bahr discusses the need for early recognition and treatment of acute myocardial infarction. These goals cannot be overemphasized. Fully one-third of the mortality associated with acute myocardial infarction occurs before patients reach medical assistance. Minimizing this unsafe period would do much to decrease this untoward outcome. In the past decade, intravenous administration of thrombolytics has been shown to reduce the mortality of acute myocardial infarction further. In those studies in which thrombolytic agents have been administered within one hour, residual ventricular function remains almost normal. Unfortunately, many patients experiencing chest pain wait hours before seeking medical advice, if they do so at all. Clearly, a greater educational effort must be extended to the general public, as well as to patients with significant likelihood of developing acute infarction.

Dr. Bahr correctly identifies the community hospital as the site at which patients with chest pain usually seek medical care. It is imperative that such patients have prompt evaluation and consideration of thrombolytic therapy. At the present time, patients wait an average of one hour after reaching an emergency department before treatment with thrombolytic agents is instituted. Emergency departments must be organized so as to evaluate patients with chest pain promptly and institute treatment rapidly. Practices such as 30-minute delays following the administration of nitroglycerine to determine whether chest pain will be totally relieved must be eliminated. Emergency rooms must be staffed by physicians capable of interpreting early electrocardiographic changes. Whereas computer-

ized electrocardiography is approximately 75 percent sensitive to the detection of early myocardial infarction, careful physician assessment approaches 100 percent sensitivity. Prompt echocardiographic evaluation of left ventricular function can often identify the presence of acute infarction even when the electrocardiogram is nondiagnostic.

Taking the concept of early diagnosis and treatment a step further, many cities are now experimenting with emergency technician diagnosis of acute infarction and administration of thrombolytic agents. Most experiences with this earliest form of treatment have been positive. This practice is likely to gain wide acceptance in the next decade. Clearly, in-field administration of therapy provides the earliest possible benefit from thrombolysis and maximal recovery of affected myocardium.

Lastly, Dr. Bahr correctly states that only 20-25 percent of patients with acute myocardial infarction receive thrombolytic therapy. Many of these patients are not good candidates for thrombolytic therapy because of potential bleeding situations. These patients should be promptly considered for primary angioplasty performed in tertiary care institutions. Thus, access to early care in the future means earlier patient recognition, widening in-field diagnosis and treatment, prompt management in emergency departments, and consideration of a broad spectrum of therapeutic options.

THE TEST OF PROFESSIONAL LIABILITY COVERAGE ISN'T WHEN YOU BUY IT.

Now Maryland physicians can get coverage from the carrier that offers a

**IT'S WHEN
YOU USE IT.**

stronger support system at the critical time of need than any other company serving the region.

The carrier is the successful physician-owned National Capital Reciprocal Insurance Company: NCRIC.

The leading professional liability carrier in D.C. now comes to Maryland offering unique approaches to service and protection, all at Maryland rates.

For example, you'll be assigned your own NCRIC claims representative who serves substantially fewer clients

than reps with other carriers. So, in claims and underwriting, you'll get

faster, more personal attention to any question or problem, minor or major.

NCRIC also offers especially attractive coverages for physicians just starting a practice, those practicing in

two or more jurisdictions (D.C., MD, VA), part-time practitioners, and physicians who take maternity leave.

Learn more about the ways NCRIC demonstrates a sensitivity to the needs of the medical community in ways no other carrier does. Call (301) 424-8136.

The relationship of maternal race and insurance status to prenatal ultrasound use in a national population

Ronald G. Kaczmarek, M.D., M.P.H.;
Roscoe M. Moore, Jr., D.V.M., Ph.D., D.Sc.; and Rosalie A. Bright, Sc.D.

Data from the first group of respondents (N=4,846) of the 1988 National Maternal and Infant Health Survey were analyzed. After controlling for potentially confounding factors, such as maternal age, in a multivariate analysis, no relationship could be demonstrated between insurance status or race and the probability of receiving a prenatal ultrasound examination.

From the Center for Devices and Radiological Health, Food and Drug Administration, Rockville, Maryland, where Dr. Kaczmarek is a medical officer; Dr. Moore is chief, Epidemiology Branch; and Dr. Bright is an epidemiologist. Reprints: Ronald Kaczmarek, M.D., Center for Devices and Radiological Health, FDA, HFZ-161, 12200 Wilkins Ave., Rockville, MD 20852.

Ultrasound examination can be an important component of prenatal care. This examination can be performed for a variety of indications, including establishing gestational age, determining fetal position, confirming the presence of fetal life, locating the placenta, assessing fetal growth, and determining the existence of multiple pregnancy.¹

Despite the absence of official recommendations from such groups as the American College of Obstetricians and Gynecologists, many obstetricians believe that each pregnancy should have at least one ultrasound examination to ensure that progress is satisfactory.²

The health insurance coverage of pregnant women varies widely. Three tiers of insurance may be identified: private, Medicaid, and none. Private insurance may be fee-for-service or prepaid health insurance. Health maintenance organizations, such as Kaiser Permanente, are examples of prepaid health insurance. Less affluent Americans may receive Medicaid benefits. An estimated 37 million Americans lack any health insurance.³

Studies have suggested that insurance status and race may be related to access to medical procedures. For example, a study noted that insured lung cancer patients who did not have surgery were significantly more likely to receive chemotherapy or radiation therapy than uninsured patients.⁴ Another study noted racial inequality in access to renal transplants.⁵ However, a study by Moore et al of access to prenatal ultrasound in a large, urban, teaching hospital found that uninsured and African-American patients were actually more likely than privately insured patients to receive prenatal ultrasound examinations.⁶

The purpose of this study was to examine the relationship between factors such as insurance status and race, and the performance of a prenatal ultrasound examination in a national population in order to replicate (or not) the results reported by Moore et al.⁶ A secondary purpose was to find independent apparent predictors of prenatal ultrasound use.

Methods

The 1988 National Maternal and Infant Health Survey (NMIHS)⁷ is a nationally representative survey designed to study factors related to adverse pregnancy outcomes, such as fetal loss, prematurity, and low birthweight. The NMIHS, conducted by the National Center for Health Statistics (NCHS), was cosponsored by a number of federal agencies, including the Center for Devices and Radiological Health (CDRH), a unit within the Food and Drug Administration.

The target sample size of the complete NMIHS was 20,000 fetal deaths, live births, and infant deaths. The design included oversampling of African-Americans, American Indians, low-birthweight infants, very low birthweight infants, and infant deaths. Signed consent statements were obtained from the voluntarily participating mothers to request the release of data from their medical records and the medical records of their infants. The mothers, hospitals, and prenatal care providers contributed information through mail questionnaires, or if necessary, by telephone or personal interviews with interviewers from the Bureau of the Census. Mothers provided demographic data, a clinical history for previous pregnancies, names of prenatal care providers, payment sources, and some clinical information about prenatal care. Providers and the delivery hospital answered more specific questions about clinical care.

The study participants were obtained from the first group of respondents to the 1988 NMIHS (N=4,846). The sample was not randomly selected and therefore may not be nationally representative, but included a broad spectrum of mothers, providers, and institutions.

Survey responses were used to construct summary variables. The outcome variable (ever had an ultrasound examination during this pregnancy) was summarized from all three sources into three levels: (1) yes—provider or hospital indicated an ultrasound examination or gave gestational age at delivery as determined by ultrasound examination, (2) no—provider and hospital did not indicate there was an ultrasound examination, and at least one source said there was no ultrasound examination, and (3) unknown—mother answered ultrasound question (no distinction between Doppler and ultrasound examination) as no or unknown, and provider and hospital indicated ultrasound examination status unknown. Similar strategies were used to summarize some of the independent clinical variables:

- previous miscarriage or preterm delivery (any of last eight pregnancies ended in miscarriage or delivery before 37-weeks gestation);
- possible multiple fetuses (based on fertility hormones or injections, and actual pregnancy outcome);
- potential miscarriage (cramps or bleeding); as well as
- a variable to indicate whether the mother's household received government income in the form of Aid to Families with Dependent Children, public assistance, welfare, food stamps, housing assistance, public housing, Social Security income, or unemployment insurance.

Other variables were derived to indicate

- fetal death (vs live birth)
- low birthweight (<2.5 kg)
- very low birthweight (<1.5 kg)
- mother is of African-American heritage
- mother is of white race
- mother's marital status
- maternal age
- mother's education
- father's education
- mother's household income
- primary prenatal care provider type
- prenatal care payment sources (according to mother)
- mother received treatment for blocked fallopian tubes
- mother was active smoker during the 12 months before delivery
- other people smoked in mother's household (passive-smoking history)
- mother gained less than 9 kg during pregnancy
- gestational time of first prenatal visit
- gestational time of second prenatal visit

Analysis was begun with univariate cross tabulations and logistic regression models using the ultrasound examination summary variable and each independent indicator variable. In each logistic regression model, the only contributing subjects were those for whom values were known for all variables in that particular model. Therefore, the contributing number of subjects varied from model to model. Variables for which coefficients exhibited statistical significance (which included all clinically meaningful associations) were combined in multivariate models; those variables that continued to manifest statistical significance were interpreted as being independently associated with prenatal ultrasound examination use and were used to derive the final model for all subjects. Lastly, the final model was applied separately to the live birth and fetal death subsets. For all univariate and final results, odds ratios (OR) and their 95 percent confidence limits (CL) were derived from the logistic regression estimates of the parameter values and standard errors.⁸

Results

Out of the total sample, 79 percent of the 2,633 mothers with known status had had at least one ultrasound examination. Simple, univariate analysis showed that African-American maternity was strongly inversely related to prenatal ultrasound examination (Table 1). In addition, insured mothers and those with military or Indian Health Service sources of payment were more likely to have had ultrasound, while mothers dependent on Medicaid or other government assistance were less likely to have had ultrasound. Table 2 summarizes the results of univariate analysis for other demographic, health care, and clinical characteristics.

When multivariate modeling was used to discover the characteristics that were consistently and independently asso-

ciated with prenatal ultrasound (Table 3), three variables were predictive; maternal age ≥ 35 , prior miscarriage or premature birth, and fetal death. None of the other variables, including race, insurance status, and provider type, were independently associated with prenatal ultrasound use. Although this model was based on fewer subjects (1,209 with known data for all model variables), the proportion who had an ultrasound examination (80 percent) remained unchanged. Cross tabulations of the model variables with maternal race revealed that in the study population, African-American

Table 1. Association of racial and insurance status with prenatal ultrasound examination.*

Variable	Odds ratio	95% confidence limit
Mother is an African-American	0.19	(0.10, 0.34)
Insurance	1.62	(1.47, 1.79)
Military or Indian Health Service	1.51	(1.01, 2.26)
Mother or her family	1.05	(0.95, 1.16)
Medicaid or other government assistance	0.79	(0.71, 0.87)
Other	0.71	(0.54, 0.94)

*Results derived from univariate models.

Table 2. Summary of associations of demographic, health care, and clinical characteristics with prenatal ultrasound examination.*

Exam was more likely ($p < 0.05$) if:

- household income $\geq \$20,000$.
- prenatal care provider was a clinic in a hospital.
- the mother was married.
- either parent had finished high school.
- maternal age ≥ 35 .
- pregnancy ended in fetal death.
- there had been prior miscarriage or premature birth.
- the mother was treated for blocked fallopian tubes.
- the mother had cramps or bleeding.
- there was a possible multiple pregnancy.

Exam was less likely ($p < 0.05$) if:

- the mother did not finish high school.
- household income $\leq \$7,000$.
- the household had government income.
- maternal age < 20 .
- the prenatal care provider was:
 - county or city health department.
 - health maintenance organization.
 - clinic at work or school.

Exam was not associated ($p > 0.05$) with:

- low or very low birthweight.
- passive or active smoking.
- < 9 kg weight gain.
- the timing of first and second prenatal visits.

*Results derived from univariate models.

Table 3. Prediction of prenatal ultrasound examination

Independent variable in model	Odds ratio	95% confidence limit
Maternal age ≥ 35	1.86	(1.37, 2.51)
Prior miscarriage or premature birth	1.40	(1.21, 1.61)
Pregnancy ended in fetal death	2.36	(1.97, 2.82)

mothers were just as likely as white mothers to be 35 years old or older, but less likely to have had a fetal death end the current pregnancy, or have had a previous miscarriage or a preterm delivery.

When the final model was applied to the subsets of 837 live births and 372 fetal deaths, the estimates for previous miscarriage or preterm delivery were of similar magnitude for the whole and both parts (OR = 1.39, 95 percent CL = 1.18, 1.64 for live births, and OR = 1.45, not statistically significant for fetal deaths). Maternal age ≥ 35 became even more important (OR = 2.98, 95 percent CL = 2.00, 4.45) for live births, and was inversely related for fetal deaths (OR = 0.66, not statistically significant).

Discussion

Based on the crude data, African-Americans were less likely than whites to receive prenatal ultrasound examinations. However, after controlling for other variables, such as maternal age, race was not found to have an effect on receiving a prenatal ultrasound examination. In the study by Moore et al,⁶ there was no evidence that African-Americans were less likely than whites to receive prenatal ultrasound examinations. Studies have demonstrated the existence of racial inequality in access to some important medical procedures such as organ transplantation. African-Americans encounter significantly longer waiting periods than whites for renal and liver transplants.^{5,9}

The United States faces a chronic shortage of kidneys, livers, and other organs for transplantation. Consequently, organ transplantation is what economists term a zero-sum game—providing an organ transplant to one individual eliminates the availability of that organ for transplantation in a second individual. It is important to observe that a shortage of ultrasound equipment or trained personnel essential to the conduct of a prenatal ultrasound does not exist in the United States, so the provision of a prenatal ultrasound examination does not preclude a second patient from also receiving the examination. This may have contributed to the observed absence of racial inequality in access to prenatal ultrasound in the study population.

Analysis of the crude data from this study indicated that insurance status was related to the probability of receiving a prenatal ultrasound examination. Uninsured individuals were significantly less likely than insured individuals to receive prenatal ultrasound examinations. However, after controlling for confounders such as age and clinical presentation, no relationship could be detected between insurance status and prenatal ultrasound examinations.

Other studies of insurance status and medical procedures have described a relationship between insurance status and the probability of receiving a medical procedure. For example, Weissman and Epstein reported that uninsured hospitalized patients in the Boston, Massachusetts area underwent 7 percent fewer procedures than insured patients.¹⁰ A study of the relationship between insurance status and the utilization

of cardiac procedures reported that Medicaid patients had 48 percent lower odds of receiving angioplasty than privately insured patients.¹¹ A study by Hadley et al³ noted that five high-cost and/or discretionary procedures (coronary artery bypass surgery, total knee replacement, total hip replacement, stapedectomy, and surgical correction of strabismus) were performed significantly less often among the uninsured. However, the Hadley study also observed that based on insurance status, no significant difference in the performance of some other medical procedures was observed.

The Hadley study indicates that the degree of cost and discretionary nature of a medical procedure may be related to the effect of insurance on access to that procedure. This may help explain why no relationship between insurance status and prenatal ultrasound examinations was observed. The cost of a prenatal ultrasound examination is far lower than the cost of any of the five high-cost procedures included in the Hadley study. Prenatal ultrasound is being increasingly viewed as an essential, not discretionary, part of prenatal care, as illustrated by the very high prevalence of prenatal ultrasound in the study population.

Many health maintenance organizations utilize prepaid health insurance, which may provide financial incentives for foregoing medical procedures such as diagnostic tests. This is contrary to what one would expect under fee-for-service insurance plans, which may provide financial incentives to physicians for the performance of medical procedures and diagnostic tests in that the physicians' level of reimbursement will increase as more procedures are performed. In our study population, membership in a health maintenance organization was not related to the probability of receiving a prenatal ultrasound examination. It is conceivable that many health maintenance organizations might consider prenatal ultrasound to be of sufficient value and importance that its use would not be restricted by cost considerations.

Medicolegal considerations may have helped promote the use of prenatal ultrasound and overcome any obstacles posed by insurance status. Malpractice suits are a problem for all physicians, but obstetricians are sued more often and for larger awards than the average physician. Consequently, obstetricians may pay annual malpractice premiums in excess of \$100,000.¹² Conventional wisdom among physicians conveys the message that since malpractice suits arise from errors of omission, not commission, cost considerations for an uninsured or Medicaid patient are relatively minor.

In our study population, the prevalence of prenatal ultrasound examinations was remarkably stable until maternal age 35, when it suddenly increased. This pattern seems to reflect a perceived sudden, as opposed to gradual, increase in risk with advancing age. Older maternal age is a recognized risk factor for adverse pregnancy outcome, such as genetically based syndromes.¹³ Teenage pregnancy is another recognized risk factor for adverse pregnancy outcomes, such as low birthweight.¹⁴ The Moore et al study had also found that prenatal ultrasound examination was associated with ad-

vanced maternal age but not very young age.⁶ Further study may be warranted to understand the mechanism behind this pattern.

The history of a previous miscarriage or preterm delivery was associated with an increased probability of receiving a prenatal ultrasound examination. This association remained after multivariate analysis was performed to control for confounding factors. Providers may be more concerned about fetal well-being in mothers with a history of a previous miscarriage or preterm delivery and be more likely to perform a prenatal ultrasound examination.

Analysis of the crude data revealed that prenatal ultrasound was used significantly more often during pregnancies that ended in fetal deaths than during pregnancies that resulted in live births. This significant difference remained after the performance of multivariate analysis to control for confounding factors. This finding may be related to the use of prenatal ultrasound to detect fetal death, but we cannot confirm this from the presently available data.

There was a substantial prevalence of prenatal ultrasound use in the study population, approximately 80 percent. This high level of prenatal ultrasound is consistent with what was observed in the 1987 pretest of the NMIHS,¹ which indicated a prenatal ultrasound prevalence of 78.8 percent. The prevalence of prenatal ultrasound in the present and Moore studies is far greater than the 33.5 percent level that was reported in the 1980 National Natality Survey.¹⁵ Several factors may have contributed to the marked increase in prenatal ultrasound use. First, there has been a substantial increase in the number of trained personnel, including both technicians and physicians, capable of performing prenatal ultrasound examinations. Second, there has been a parallel increase in the supply of ultrasound equipment. Third, ultrasound is widely perceived as a safe examination because it does not entail the use of ionizing radiation. Fourth, the clinical applications of ultrasound have increased over the past decade.

An important caveat influencing the interpretation of this study is the nature of the study group. It represents instances in which the state cooperated by sending NCHS birth/vital records with the mother's name and address, the mother responded to the survey, and her prenatal care providers and hospital provided data. The extent to which these factors influence the generalizability of the results is unknown, although the sample apparently represents a broad spectrum of experience. Except for indicators of live births and fetal deaths, oversampling variables were used in the analysis and had no influence.

The major advantage of the present study compared with the original Moore study is that the eligibility criteria in the present study are far more inclusive. Mothers who delivered at virtually any of the health care facilities in more than 20 states were eligible for participation in the present study. In contrast, the original Moore study, although comprehensive in scope, was limited to one large, urban, teaching institution. Factors unique to that institution, that region, that size of

hospital, and the nature of that hospital (i.e., teaching hospital) may have influenced the results.

In conclusion, after controlling for potential confounders such as maternal age and clinical presentation, no relationship was observed between insurance status or race and the probability of receiving a prenatal ultrasound examination. Factors such as the perceived importance and limited cost of the examination, as well as medicolegal considerations, may have helped override any obstacles posed by lack of insurance. The high level of prenatal ultrasound use may reflect its increased availability and perceived importance, or the presence of risk factors for an adverse pregnancy outcome. Further study is warranted to determine the national prevalence of prenatal ultrasound use.

THE MARK OF EXCELLENCE

Thalassemia screening in Baltimore

Allen D. Schwartz, M.D. and Ruth E. Luddy, M.D.

From Sinai Hospital of Baltimore where Dr. Schwartz is chairman, Department of Pediatrics and Dr. Luddy is associate attending, Department of Pediatrics. Reprints: Allen D. Schwartz, M.D., Sinai Hospital of Baltimore, Belvedere at Greenspring, Baltimore, MD 21215.

An education and screening program for β -thalassemia was offered to members of the Greek and Italian communities in the Baltimore area to allow for educated decisions regarding childbearing. Similar programs have been effective in decreasing the incidence of β -thalassemia major in other countries.

In 1925, Thomas B. Cooley and Pearl Lee described five children in Detroit with severe anemia and unusual red cell morphology. The children also had hepatosplenomegaly, a peculiar appearance caused by enlargement of the cranial and facial bones, and abnormal long bones.¹ These two pediatricians are now credited with separating a newly recognized disorder from a conglomerate of childhood infectious and malignant diseases. Over the following years, it became apparent that Cooley's anemia occurred predominantly in individuals of Mediterranean heritage, and the term *thalassemia*, taken from Greek words meaning "sea in the blood," was coined to associate the disease with the Mediterranean Sea.²

In both the United States and Italy, a mild microcytic anemia was later described that was called familial microcytosis. By the early 1940s, it was established that both parents of children with Cooley's anemia had this finding and that thalassemia, in the heterozygous state, resulted in thalassemia minor or trait. Those affected often might go unnoticed or be misdiagnosed as having mild iron deficiency. In the homozygous state, however, thalassemia caused the severe and often fatal thalassemia major described by Cooley and Lee.³ Although individuals with thalassemia minor are healthy and live normal lives, the genetic implications should be of great concern to those affected.

Education and screening programs for β -thalassemia trait, a defect in β -chain production of the hemoglobin molecule, have been conducted in a number of countries throughout the world, including high-risk communities in the United States, Britain, Italy, Greece, and Cyprus.⁴⁻⁹ In Maryland, there are tens of thousands of citizens of Mediterranean origin, and a large number of people in the Greek and Italian communities with β -thalassemia minor remain unrecognized. In the late 1970s, a program was begun in the greater Baltimore area and other parts of Maryland to screen individuals of Mediterranean heritage. The program was discontinued in the mid-1980s since the Thalassemia Committee of Greater Baltimore was concerned about the possibilities of litigation, because

insurance coverage of the blood-drawing team was unclear. The purpose of this communication is to make the physicians of Maryland aware of how common thalassemia minor is in Baltimore, especially in certain ethnic communities, and to describe a simple method of screening to differentiate it from iron deficiency anemia. (As we had no idea of the actual incidence of thalassemia in Baltimore, we have not conducted a follow-up to look for changes.)

Methods

A comprehensive screening program was offered to members of the Greek and Italian communities of Baltimore, Annapolis, and surrounding areas. The majority of the Greek community was offered the program through their churches; the Italian community was screened through one church in Baltimore and various chapters of the Order of the Sons of Italy. A small number of individuals who had heard of the screening were self-referred for testing.

Prior to any testing, educational programs involving lectures, question and answer sessions, and distribution of literature were offered to the target population at risk. In most instances, the blood drawing was done at least one week following these programs to allow those who did not wish to be tested to gracefully avoid the program, and those who wished to bring family members to the screening, the opportunity to do so.

After signed consent was obtained, 4.5 cc of venous blood was drawn into sodium edetate (Versene) anticoagulant. Anticoagulated blood was screened with the Model S Coulter electronic counter; this counter directly measures red-cell count, hemoglobin, and mean corpuscular volume (MCV). Based on previously reported studies, microcytosis in adults was defined as an MCV of less than $79\mu^3$. In the small numbers of preadolescents screened, normal MCV levels were defined as previously reported in the literature.¹⁰ Cellulose acetate hemoglobin electrophoresis was done on every specimen. All patients with microcytosis had quantitation of hemoglobin A₂ and F to detect β -thalassemia trait, and had free erythrocyte protoporphyrin (FEP) levels measured on whole blood and red blood cells to indicate the presence of iron deficiency. The hemoglobin A₂ levels were done by column chromatography. These levels were not determined on individuals with a normal MCV. All laboratory testing was performed by the laboratories of the Maryland Department of Health and Mental Hygiene. Results, printed in English, Greek, and Italian, were sent to all individuals tested. Those with unexpected serious findings were notified by mail and phone to insure medical follow-up. Those with thalassemia trait and other hemoglobinopathies were offered genetic counseling services. Approval for the study was obtained from the University of Maryland Hospital's Human Volunteers Research Committee.

Results

A total of 1,527 individuals were screened. Of these, 1,356 had normal MCV determinations. Within this group,

there were two unrelated individuals with Hgb AC (hemoglobin C trait), and four with Hgb AS (sickle cell trait)—two of whom were related (mother and son). These six were counseled accordingly. One elderly male was found to have a markedly elevated white cell count, and had previously been diagnosed as having chronic lymphocytic leukemia. One man with a history of small bowel resection had a hematocrit of 28 percent and an elevated MCV of $116\mu^3$. He was referred to his physician to be evaluated, and was found to have vitamin B₁₂ deficiency.

One hundred seventy individuals were found to have a low MCV. Of these, 126 (8 percent of the total population screened) had elevated levels of Hgb A₂ and/or Hgb F, and were diagnosed as having β -thalassemia trait. Individuals with β - δ -thalassemia have microcytosis and elevated Hgb F, but normal Hgb A₂ levels; this has the same genetic implications as β -thalassemia trait.

Eight individuals had microcytosis, normal Hgb A₂ and F levels, and elevated FEP levels. They were diagnosed as having iron deficiency anemia. Seven were women in their childbearing years, and one was a man with a recent history of surgery with significant blood loss. All were, therefore, already at risk or had a good explanation for iron deficiency anemia.

Thirty-six people had microcytosis, but no evidence of β -thalassemia or iron deficiency. A number of these subjects had the same last name and belonged to the same church or organization, suggesting that they were related. No attempt, however, was made to accurately document relationships. These individuals were believed to have α -thalassemia minor, a mild disorder in which there is a decrease in production of α -chains of the hemoglobin molecule, but one that does not have the same clinical significance in this particular population as does β -thalassemia minor.

Table 1 shows the results of the study, separating participants by country of origin. Mild microcytosis attributed to the presence of β -thalassemia trait was a more common finding in the Greek population (10 percent) than in the Italian population (5.1 percent). This difference was statistically significant ($p < .005$ by chi-square analysis). Results from three Greek churches in Baltimore were culled from the data, because over 50 percent of the participants (831 of 1,527) were from these churches. These data are shown in Table 2.

Table 1. Results of thalassemia screening in greater Baltimore and Annapolis areas

Nationality	Total	Normal MCV		Low MCV		
		Normal	Abnormal	β -thal. minor	Iron Defic.	α -thal. minor
Greek	1,004	858	6*	101 (10%)	6	33 (3.2%)
Italian	523	491	2**	25 (5.1%)	2	3 (0.5%)
Total	1,527	1,349 (88%)	8	126 (8%)	8	36 (2%)

Discussion

Electronic measurement of the MCV of the erythrocyte is a reliable, rapid, and inexpensive method for screening for microcytosis. The more expensive and time-consuming screening tests need only be used to subcategorize those with microcytic indices into iron-deficiency anemia patients or those with α - or β -thalassemia minor. In this high-risk population, over 88 percent of the patients had no microcytosis and required no further workup. This screen, however, is not 100 percent effective, nor are any screening tests, in detecting the so-called silent carrier of β -thalassemia,^{11,12} which can only be detected by methods too complex for screening large populations. Fortunately, the prevalence of this silent carrier state for thalassemia is believed to be very uncommon.

This screening program documented a prevalence of 5 percent of β -thalassemia trait in those of Italian heritage. Population surveys in Italy show a remarkable heterogeneity in prevalence, ranging from 0.5 to 2 percent in certain northern and central regions of the country to as high as 27–30 percent in southern Sardinia.¹³ Our findings in screening a population representing diverse regions in Italy should not be unexpected.

A 10 percent prevalence of β -thalassemia minor was found in the Greek community. When the data obtained from the three Greek churches in Baltimore were evaluated separately, 98 of 831 subjects tested were positive, giving a prevalence of 12 percent (Table 2). The highest prevalence, found in those screened at St. Nicholas Church, was 23 percent. As in Italy, the distribution of the β -thalassemia gene in Greece is uneven, with gene frequencies ranging from under 5 to over 20 percent. The majority of the congregation of St. Nicholas Church comes from a number of islands of the Aegean Sea, with a large number from the island of Rhodes. Thalassemia is widespread among the island populations, with certain areas of Rhodes reported to have a prevalence as high as 25 percent.¹³ Members of the remaining churches trace their ancestry to areas of the mainland where the prevalence in different sections ranges from 5 to 15 percent. The high prevalence of β -thalassemia minor detected in Baltimore's Greek community is very likely due to the fact that those with a history of anemia or a family history of thalassemia were more likely to seek screening, resulting in a falsely elevated percentage of those affected. A second plausible explanation

for our findings, however, is that the prevalence of β -thalassemia minor in these Greek and Italian communities approximates that documented in the areas of origin of the subjects tested.

Thalassemia major is a very serious illness that usually requires intensive transfusion and chelation therapy. Persons with β -thalassemia minor, although healthy, are often thought to have iron deficiency and are treated with medicinal iron, a situation which has been known to lead to hemosiderosis.¹⁴ Mass-screening programs for β -thalassemia trait have already been shown to be effective, and have resulted in a fall in the birthrate of individuals with β -thalassemia major in a number of areas of the world.^{6,9,15,16} A strong case can therefore be made for screening and education programs in populations with a high prevalence of β -thalassemia trait, such as are found in Maryland.

A MEDICAL TEST SHOULD NOT SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESSTM MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

ACCESSIBLE MRI of

Magnetic Resonance Imaging without claustrophobia or noise associated with other systems

Merkel cell carcinoma of the eyelid: A report of two new cases and a review of the literature

Howard L. Cummings, M.D. and W. Richard Green, M.D.

Dr. Cummings is a resident in ophthalmology, Greater Baltimore Medical Center, Baltimore, MD and Dr. Green is professor of ophthalmology and associate professor of pathology, Eye Pathology Laboratory, Wilmer Institute, and the Department of Pathology, The Johns Hopkins Medical Institutions, Baltimore, MD.

Merkel cell carcinoma is a cutaneous neoplasm that rarely occurs in the eyelid. The tumor has an aggressive nature with high local recurrence and metastases rates. Early diagnosis and prompt complete excision with frozen section monitoring of margins are recommended.

The Merkel cell is a specialized cell of the basal epidermis that is presumably of neuroectodermal or neural crest origin.¹ The Merkel cell functions as a slowly adapting mechanoreceptor that perceives mechanical stimuli including touch and hair movement.² Recently, cutaneous neoplasms of Merkel cell differentiation have been reported.³⁻⁶ Although origination in the ocular tissues is rare, a few cases involving the eyelid have occurred.⁷⁻⁸ To our knowledge, only 11 isolated cases of Merkel cell carcinoma of the eyelid have been reported in the ophthalmic literature.

We present herein a histopathologic study of two new cases of eyelid Merkel cell carcinoma and a clinicopathologic summary of the reported cases. Immunohistochemical and ultrastructural analyses were also performed to further distinguish this rare lid tumor.

Report of cases

Case one. A 74-year-old man underwent excision of a growing nodule of the right upper eyelid. Examination disclosed an ill-defined bosselated and gray-tan region measuring 1.0 x 0.6 cm in the upper lid. A biopsy of the lesion was performed and led to the diagnosis of Merkel cell tumor. A total excision with frozen section monitoring of the surgical margins was subsequently performed (**Figure 1**). A Cutler-Beard procedure was utilized for reconstruction of the upper lid. Systemic evaluation, including computed tomography (CT) scan of the chest and abdomen, was normal. Four months later, the patient noted a mass in the right jugulodigastric region. Biopsy of this lesion revealed Merkel cell tumor consistent with the primary. One month later, the patient presented with an 8 mm small mobile lymph node in the same region. CT scan revealed no appreciable adenopathy. The patient underwent local radiation therapy. Eleven months after completion of radiation therapy, there was no evidence of local recurrence.

Figure 1. (Case 1) Full-thickness resection of lid with a 3.0 x 3.5 mm tumor at the lid-margin (between arrows). The orbicularis muscle (asterisk) and tarsus (arrowhead) are present (hematoxylin and eosin x 15).

Case two. A 61-year-old white female presented with a cystic appearing lesion of the left upper eyelid margin with a duration of three months. The clinical diagnosis was chalazion. The patient underwent excision of the lesion and a diagnosis of Merkel cell tumor was made. One month later, the patient presented with recurrence. A second excision was performed, and she has been free of tumor for eight months.

Pathologic findings

Light microscopy. The tumor in both cases was nonencapsulated and composed of large, round-to-oval cells with scant cytoplasm, round-shaped nuclei, and variably distinct cell borders (**Figure 2**). The cells were arranged in lobules and cords with associated mild acute and chronic inflammatory

Figure 2. Tumor is composed of large, round-to-oval cells with uniform nuclei that have a fine chromatin pattern and occasional micronucleoli and a thin rim of cytoplasm. Mitotic activity (arrow) is present (hematoxylin and eosin x 575).

cell infiltration. The tumor infiltrated the orbicularis muscle and the muscle of Riolan. Marked mitotic activity was present in both cases with 180 and 132 mitoses per 40 high power fields in case one and two, respectively. The tumor cells stained positively for cytoplasmic granules with the Grimelius stain.

All surgical margins of the specimen were tumor-free in case one, and one margin was positive for tumor in case two.

Electron microscopy. Transmission electron microscopy was performed in case one. The predominant cells were arranged in clusters and had a trabecular pattern in some areas. The cells contained scant cytoplasm and nuclei with one or two nucleoli and finely dispersed chromatin. Rare membrane-bound cytoplasmic electron-dense core granules, occasional juxtanuclear intermediate filaments measuring 10 nm in diameter, and occasional junctional complexes were present (**Figure 3**). Occasional small cells with a round-to-oval nucleus, abundant heterochromatin, scant cytoplasm with free ribosomes, and no junctional complexes (lymphocytes) were observed among the tumor cells. Similar cells with abundant cytoplasm containing numerous rough endoplasmic reticulum (plasma cells), as well as medium-sized cells with abundant membrane-bound multimembranous material (mast cells), were also present.

Immunohistochemical analysis. Paraffin sections of the

Figure 3. Ultrastructural appearance of tumor cells with membrane-bound electron dense core granules (arrows, top) and paranuclear intermediate filaments (asterisk, bottom) (top and bottom x 10,000).

Figure 4. Tumor cells stain intensely for neuron-specific enolase (immunoperoxidase x 575).

tissue in both cases were stained with hematoxylin-eosin, periodic acid-schiff (PAS), and neuron-specific enolase (**Figure 4**). In addition, case one was stained for cytokeratin, neurofilaments, leukocyte common antigen, and S-100.

Neuron-specific enolase was positive in both cases. Some tumor cells had mild, positive, staining reaction for cytokeratin. Marker studies for neurofilaments, S-100, and a common leukocyte antigen were negative.

Comment

In 1875, Merkel first described clear oval cells occurring in continuity with dermal nerve endings located in the basal epidermis.⁶ He called these cells *Tastzellen*.⁶ Merkel noted that these peculiar cells were penetrated by nerve fibers whose myelin sheath terminated outside the cell. He postulated that their function was similar to Meissner bodies. In 1972, Toker³ recognized a distinctive primary neuroendocrine carcinoma of the skin which he postulated originated from sudoriferous glands. He called the tumor trabecular carcinoma of the skin, based on its histologic trabecular pattern. Winkelmann and Breathnach,¹⁹ in 1973, reviewed Merkel cell characteristics and predicted that the Merkel cell could give rise to tumors. Ultrastructural studies by Tang and Toker⁴ in 1978 revealed that trabecular carcinoma of the skin was not of sweat gland origin but contained dense core neurosecretory granules suggesting cutaneous Merkel cell origin. Sibley⁵ and Sidhu⁷ subsequently characterized the histologic and ultrastructural features of this distinctive skin tumor. Champion,⁸ in 1982, was the first to report a Merkel cell neoplasm of the eyelid in the ophthalmic literature.

By light microscopy, the Merkel cell is a clear, non-dendritic, argyrophilic, and variable PAS positive cell located in the basal layer of the epidermis.¹ Electron microscopy discloses numerous membrane-bound dense core granules 80–120 nm in diameter located in the cytoplasm.² The cell is in close association with an expanded axon terminal above the

basal epithelium. Desmosomal junctions secure the Merkel cell to adjacent keratinocytes. Despite having dense core granules, the Merkel cell does not appear to be of the APUD (amine precursor uptake and decarboxylation) system.¹

The typical histologic appearance of a Merkel cell tumor is characterized by sheets of cells in a diffuse pattern that infiltrate the dermis or, less often, the subcutaneous tissue. Other growth patterns—trabecular³ and pseudoglandular²⁰—may be present. The cells are usually uniform in size, non-cohesive, and round-to-oval in shape. Cytoplasm is scant. The nuclei are also round-to-oval with fine and granular cytoplasm with two to three small nucleoli adjacent to the nuclear membrane. The mitotic index is typically high. Due to the immature blastic features of the tumor, the histologic diagnosis can be extremely difficult and the tumor may be misdiagnosed as a malignant lymphoma. Molding may be a distinguishing, light microscopic feature.²⁰ Leong²¹ noted a ball-in-mitt configuration in which crescentic cells wrapped around oval cells in 12 of 13 cases of Merkel cell carcinoma of the skin.

Special stains aid in the diagnosis and demonstrate the endocrine nature of Merkel cell tumors. The Grimelius silver stain for neurosecretory granules can be focally positive.²¹ Formalin-preserved specimens have a lower sensitivity for positive Grimelius-staining than those preserved in Bouin's fixative.^{20–22} Stains for melanin (Masson-Fontana) and amyloid (congo red) are typically negative, although rare positive cases have been reported.^{23,24}

Immunohistochemical staining may also be enlisted to distinguish Merkel cell tumors from other cutaneous neoplasms. Neuron-specific enolase appears to be the most useful diagnostic marker. According to the series by Leong,²¹ neuron-specific enolase was the most consistent marker, being present in 12 of 12 tumors. More recently, staining for cytokeratin has been found to be strongly reactive in Merkel cell tumors^{21,25} in a round, globular, juxtanuclear pattern. Neurofilaments have also been identified in Merkel cell tumors.^{21,25} Peptide hormones may be expressed by Merkel cell tumors and include adrenocorticotrophic (ACTH), calcitonin, somatostatin, and insulin staining reported.²³ Leukocyte common antigen and melanoma-associated antigen (HMB-45) are negative. Pajor and coworkers¹⁰ found focal peanut agglutinin positivity in six of 10 Merkel cell tumors and suggest that this is an additional tool for use in the diagnosis of Merkel cell tumors.

Electron microscopy confirmation is desirable when the light microscopy findings are atypical. Ultrastructural studies are essential when the diagnosis is uncertain by light microscopy due to the immature blastic feature of this tumor. Ultrastructural analysis discloses large round-to-oval nuclei with small eccentric nucleoli.^{7,26} The cytoplasm is poorly differentiated with small numbers of mitochondria, rough endoplasmic reticulum, and prominent Golgi apparatus.^{4,7,23,27} The most prominent features are 120–210 nm diameter dense-core neurosecretory granules located in the peripheral

cytoplasm^{7,20-23,27} and perinuclear aggregates of intermediate (10 nm) microfilaments.^{5,7,21} Zonula adherens and undifferentiated intercellular junctions have been observed.^{9,27} There has been some debate regarding the true origin of the Merkel cell. It has been suggested that the Merkel cell is of neural crest origin, as its cytoplasmic dense-core granules are similar to those of the APUD cell system.^{1,26,28,29} However, the dense-core granules have not been found to contain catecholamines or neurotransmitters in humans. The polypeptide neurotransmitter Met-enkephalin has been demonstrated in primate Merkel cells supporting a link to the APUD system.³⁰

The differential diagnosis includes the primary cutaneous neoplasms of the eyelid, metastatic oat cell carcinoma, islet cell carcinoma, neuroblastoma, plasmacytoma, and large cell lymphoma. By light microscopy, metastatic oat cell carcinoma, metastatic primitive neuroendocrine tumors, and large cell lymphoma pose the greatest difficulty in diagnosis. Morphologic features of value in differentiating similar tumors include keratinization in squamous cell carcinoma, melanosomes in malignant melanoma, and intracytoplasmic lipid in sebaceous cell carcinoma. Immunohistochemical staining can exclude tumors morphologically similar to Merkel cell tumors. Neuroblastoma stains for neuron-specific enolase but is cytokeratin negative.⁹ Large cell lymphoma stains for leukocyte common antigen and will not stain for neuron-specific enolase, cytokeratin, or neurofilaments.⁹ Metastatic neuroendocrine tumors may be differentiated by their lack of a juxtanuclear staining pattern for cytokeratin and neurofilament.²¹ The presence of perinuclear intermediate filaments^{25,31} is perhaps the key identifying characteristic of the Merkel cell tumor that differentiates it from the metastatic neuroendocrine carcinoma.

The clinical diagnosis of Merkel cell tumor should be considered whenever an elderly patient presents with a growing violaceous skin nodule or recurrent chalazion of the upper eyelid.

The clinical features of the 11 cases previously reported in the ophthalmic literature and our two cases are summarized. The mean age at presentation was 76 years and all patients were of white race. The race of four patients was not reported. There was a predisposition for women. All tumors occurred in the upper eyelid, supporting the hypothesis that sun and ultraviolet light-induced damage predispose one to the development of this tumor.

Merkel cell tumor of the lower lid has been reported in the dermatology literature.⁷ In a review of the literature, Hitchcock and coworkers³² reported that 50 percent of lesions occurred in sun-exposed areas of the head and neck, males and females were equally affected, and the mean age at presentation was 67.9 years.

Lymph node metastases^{8,10} and local recurrences^{9,17} have occurred with Merkel cell tumors of the eyelid. Metastases and local recurrence are common in this skin tumor.³² Death was attributed to metastatic disease in 20 percent of patients.

Of the 43 cases of Merkel cell carcinoma of the skin reported by Sibley and coworkers,⁵ 30 percent of patients had local recurrence, 65 percent had lymph node metastases, and a third died with metastatic tumor.

Successful treatment is determined by early diagnosis and prompt complete excision. The tumor should be excised with frozen section monitoring of surgical margins to assure completeness of excision. The clinical presentation often belies the aggressive nature of this tumor and the diagnosis may often be made or suspected only after histopathologic evaluation. Examination of regional lymph nodes and biopsy of suspicious nodes are the next steps in management of Merkel cell tumors. Information on the use of radiation and systemic chemotherapy for the treatment of Merkel cell tumors of the eyelid is limited due to the small sample size; however, these treatment modalities should be considered for extensive primary lesions, metastases, or recurrence.^{20,33} Careful follow-up evaluations are necessary.

Against Drugs**

Council Highlights

The following information is presented in response to the recommendation approved by Council at its meeting on November 21, 1991: "Med Chi should distribute the AMA information concerning biomedical research to all Med Chi physicians."

What biomedical research has accomplished

In an appearance on the "Today Show" in 1985, the co-director of People for the Ethical Treatment of Animals commented on the achievements of biomedical research using animals: "If it were such a valuable way to gain knowledge, we should have eternal life by now."

Obviously, she missed the point. The issue is not what *has not* been accomplished through the use of animals in biomedical research, but what *has* been accomplished.

Scientists agree that virtually every advance in medical science in the 20th century—from antibiotics and vaccines to antidepressant drugs and organ transplants—was achieved either directly or indirectly through the use of animals in laboratory experiments.

The list of accomplishments is long, indeed:

Pre-1900	Treatment of rabies, anthrax, beriberi (thiamine deficiency), and smallpox. Principles of infection control and pain relief. Management of heart failure.
Early 1900s	Treatment of histamine shock, pellagra (niacin deficiency), and rickets (Vitamin D deficiency). Electrocardiography and cardiac catheterization.
1920s	Discovery of thyroxine. Intravenous feeding. Discovery of insulin for diabetes control.
1930s	Therapeutic use of sulfa drugs. Prevention of tetanus. Development of anticoagulants, modern anesthesia, and neuromuscular blocking agents.
1940s	Treatment of rheumatoid arthritis and whooping cough. Therapeutic use of antibiotics, such as penicillin, aureomycin, and streptomycin. Discovery of the Rh Factor. Treatment of leprosy. Prevention of diphtheria.
1950s	Prevention of poliomyelitis. Development of cancer chemotherapy. Open-heart surgery and cardiac pacemaker.
1960s	Prevention of rubella. Corneal transplant and coronary bypass surgery. Therapeutic use of cortisone. Development of radioimmunoassay to measure minute quantities of antibodies, hormones, and other substances in the body.
1970s	Prevention of measles. Modern treatment of coronary insufficiency. Heart transplant. Development of non-addictive pain killers.

1980s	Use of cyclosporine and other anti-rejection drugs. Artificial heart transplantation. Identification of psychophysiological factors in depression, anxiety, and phobias. Development of monoclonal antibodies for treating disease.
-------	--

This list could be much longer, but the point is obvious: Without research involving laboratory animals, these advances in medical science would have been impossible.

Humans aren't the only beneficiaries of animal research. The welfare of animals themselves has been greatly improved. Here are just a few of the advances in veterinary medicine:

Vaccination against distemper, rabies, parvo virus, infectious hepatitis, anthrax, and tetanus.
Treatment for animal parasites such as hookworm and heartworm.
Orthopaedic surgery for horses.
Surgery to correct hip dysplasia in dogs.
Experimental radiation techniques and immunotherapy for cancer in dogs.
Identification and prevention of brucellosis and tuberculosis in cattle.
Treatment of feline leukemia.
Vaccine for Newcastle disease in poultry.
Embryo transfer techniques to improve breeding.
Improved nutrition for pets.

November 1990

Key facts on animal rights controversy

Animal Welfare Act

- Passed in 1966 and amended in 1970, 1976, and 1985.
- Protects against theft of animals for sale to research labs.
- Stipulates humane treatment for animals in universities, medical schools, hospital labs, and other research institutions.
- Establishes physical environment necessary to assure the well-being of all animals used in research laboratories.
- Provides for adequate housing for all laboratory animals.
- Provides guidelines for veterinary treatment, anesthesia, and formation of Animal Care and Use Committee at all research institutions receiving federal funding. Committee must include lay member from local community.
- Monitored by U.S. Department of Agriculture.

Health Research Extension Act

- Passed in 1985 (amendment to Public Health Service Act of 1978).
- Stipulates that NIH promote 'alternatives' to animal use in biomedical research.
- Dictates that Animal Care and Use Committee consist of at least one veterinarian, one non-scientist and, one person not affiliated with institution.

Council Highlights

Disease statistics

Two-thirds of Nobel Prizes awarded since 1901 made for discoveries that required the use of animals. For example, relationship between cholesterol and heart disease studied in dogs, 1985; link between virus and cancer studied in chickens, 1966; transplantation studied using cattle, mice, and chicken embryos, 1960; and kidney and bone marrow transplantation, 1990.

Two decades ago, kidney disease killed 20,000 per year in the United States. Today that number has decreased by 40 percent (still kills 12,000 each year). Seventy thousand patients in United States are on renal dialysis (developed using dogs). Seven thousand patients receive kidney transplants each year in United States (developed using dogs).

Polio afflicted 58,000 in 1952 in United States and only four in 1984 (vaccine developed using monkeys).

Heart disease still kills 500,000 each year in United States. Sixty million United States residents have some form of heart or vascular disease. Two hundred million coronary artery bypass graft surgeries performed each year in United States (developed using dogs).

Animal rights groups

More than 400 groups exist with total budget of over \$200 million per year in United States alone. Since 1982, more than 100 new radical groups formed.

More than 35 labs have been vandalized and more than 2,000 animals have been stolen in United States alone between 1988 and 1990.

Tactics include: break-in, civil disobedience, vandalism, picketing, threats (personal and property), sit-ins, letter-writing campaigns (media and elected officials), harassment of scientists, boycotts of products, and lawsuits.

Responsible for millions of dollars in damage. Includes destruction of lab under construction at University of California—Davis causing over \$3.5 million damage.

Since 1984, number of Americans belonging to animal rights groups has increased five times to approximately 10 million. Recent ALF break-in at University of Oregon. Perpetrators reported to the press that no violations of USDA requirements were noted.

Pound animals

More than 10 million animals killed annually in pounds and shelters.

Total annual cost of pet animal control in United States is \$500 million.

Forty to eighty percent of animals in pounds and shelters were brought in by owners.

Dogs and cats from pounds represent less than one-tenth of 1 percent of animals used for research per year in United States.

Statistics reveal that only one animal is used for research purposes every ten years for each United States citizen. Nine out of 10 times, that animal is a mouse or rat.

In 1982–83, 17–22 million animals were used for research. Seventy-five to ninety percent were rodents. A total of 138,000 were dogs; 55,000 were cats.

Forty percent reduction in total number of animals used in the 10-year period 1968–1978.

Cost of pound animal is less than \$100. Purpose-bred animal is over \$500.

Research funding

Only about 25 percent of approved grants are funded by United States government.

Duplication of research is highly unlikely.

Painful experiments

1984 USDA report indicates

61 percent of animals used in experiments did not involve pain;

31 percent of animals subjected to pain BUT were anesthetized prior to experiment; and

8 percent of animals used in experiments that involved pain but purpose of experiment was to study pain.

Chronic pain is one of the most costly health problems in United States.

Fifty billion dollars spent in United States each year on direct medical expenses, lost productivity, and lost income associated with pain.

Three hundred thousand traumatic injuries each year in United States that involve chronic pain.

Public surveys

All public surveys have shown overwhelming support for continued animal use in biomedical research.

Fear of biomedical research institutions using lost or stolen pets unfounded. Foundation for Biomedical Research survey of police and animal control agencies in 10 largest United States cities reveal no reported thefts of animals with subsequent sale to research institutions. Stolen dogs are most often pedigree animals to be resold as pets.

Facts about biomedical research

Two-thirds of the Nobel prizes awarded since 1901 were for discoveries requiring the use of animals. These included research that established the relationship between cholesterol and heart disease.

Two decades ago, kidney disease killed 20,000 people every year in the United States. Today that number has decreased by 40 percent thanks to animal research.

In 1952, polio afflicted 58,000 people. A vaccine developed using monkeys has virtually wiped out that dread disease.

Many more vaccines were developed using animals. Measles, rubella, tetanus, mumps, diphtheria, and many other diseases can be prevented as a result.

Special techniques like those used in open-heart surgery, microsurgery, and organ transplants were developed through animal research.

If you've been hospitalized, you may have benefitted from anesthesia, intravenous feeding, or the use of non-addictive pain killers. Animal research contributed to these techniques.

Following are just a few of the other diseases and conditions studied through animal research: diabetes, cholera, hemophilia, depression, muscular dystrophy, rickets, glaucoma, Parkinson's, rabies, spinal cord injury, and hepatitis.

Council Highlights

To receive further information on biomedical research, write: Biomedical Research, American Medical Association, 515 North State Street, Chicago, IL 60610.

We all benefit...

Let's ensure the future of biomedical research

We all live in a much healthier world than our parents did. Physicians are curing and preventing diseases that, until recently, were thought untreatable. Millions are enjoying longer, healthier lives.

The major reason for these successes is biomedical research. Research has improved our understanding of how biological systems function and advance our medical knowledge. The continued progress of research is essential to answering many medical questions that plague humankind.

Research requires animal testing

Today, breakthroughs in medicine are threatened by a small group of individuals who object to further medical progress, especially research that uses animals. With protests, with political pressure, with bomb threats, and with other tactics, they fight to stop research using animals at all costs.

Their efforts ignore one fact. Virtually every advance in medical science during the 20th century has directly or indirectly involved the use of animals in laboratory studies.

Scientists need to test theories, develop treatments or procedures, and prove the safety of new medicines. Some experiments can be done using cell cultures, computers, or other methods. But, at one point or another, biomedical research requires testing in mammals.

The only alternative is discontinuing the vital research that could one day produce cures for Alzheimer's, AIDS, heart disease, and cancer. This alternative is clearly not acceptable nor ethical.

Activists call research unethical

Animal activists do not see the need for animal testing. They perceive research as exploitation, despite its value in curing disease and easing human suffering.

Current activist groups include:

Physicians Committee for Responsible Medicine (PCRM) professes to speak for organized medicine. Only 2,000 of the group's 30,000 members are allegedly physicians.

People for the Ethical Treatment of Animals (PETA) acts on the

premise that all mammals are created equal. PETA is the most active and visible militant organization nationally.

Animal Liberation Front (ALF) has been identified by Scotland Yard as a terrorist organization. ALF members have raided laboratories, destroying equipment, records, and buildings.

Members of these organizations have actively terrorized universities, medical institutions, physicians, and researchers involved in vital medical studies. Their tactics have driven scientists from the medical field and needlessly increased the cost of research by billions of dollars.

These groups want a total ban on research using animals. This ban would clearly slow the pace of health-related breakthroughs, impeding new procedures and technologies that benefit patients. The potential damage to human health cannot be measured.

Public, physicians support research

Most people believe that the cost of a research ban is too high. A 1989 Gallup survey reported that 77 percent of Americans believe the use of animals in research is necessary for progress in medicine. A 1988 survey showed that 97 percent of U.S. physicians support using animals in clinical research.

At the same time, the public believes that animals should be treated humanely. Researchers are required to obey laws that establish standards for animal research. Efforts are made to reduce the number of animals used or find alternative methods whenever practical or possible.

Animals activists have sought to limit animal research by lobbying for more restrictive laws. In some states, for example, they have succeeded in banning the use of pound animals for research. Higher costs are the result, adding a new roadblock to scientific progress.

What lies ahead?

Biomedical research is attempting to solve our age's most perplexing medical problems. The continued pursuit of answers, within firmly regulated guidelines, must continue. You can help guarantee this happens:

Before you make contributions to any animal welfare group, check its background and goals.

Oppose local, state, or federal legislation that may hamper biomedical research. Existing laws are adequate to ensure humane treatment of animals.

Support medical research through your contributions to reputable voluntary health organizations. ■

Imaging Case of the Month

A 13-year-old white male presented with the insidious onset of painful swelling in his left index finger. There was no history of trauma, penetrating wound, or insect bite. Up to three to four adult aspirin were taken to relieve the pain. On physical examination, diffuse swelling involved the proximal interphalangeal (PIP) joint and extended proximally toward the metacarpophalangeal (MCP) joint. There was full range of motion and no pain to direct palpation. White blood count (WBC), sedimentation rate, and alkaline phosphatase values were normal.

Figure 1.

Figure 2.

Figure 3.

Figure 4.

Figure 5.

Imaging Case of the Month

Osteoid osteoma in a phalanx

Figure 1. Plain radiograph shows an area of lucency with a possible sclerotic center (arrow).

Figure 2. Radionuclide bone scan of a blood pool image shows a tiny focus of more intense rounded activity distally (arrow) corresponding to area of lucency on the radiograph.

Figure 3. Radionuclide bone scan (delayed image) also demonstrates an intense rounded area of increased tracer activity, (arrow), corresponding to radiographic lucency.

Figure 4. CT scan: Transaxial section delineates the extent of reactive sclerosis, the lucent lesion, and the calcified central nidus (arrow).

Figure 5. CT scan: Direct sagittal section delineates the extent of reactive sclerosis, the lucent lesion, and the calcified central nidus (arrow).

Imaging findings

Plain radiograph (**Figure 1**) demonstrated soft tissue swelling surrounding a slightly enlarged, elongated left second proximal phalanx, with chronic type cortical thickening, and distally, a tiny round area of lucency with a possible sclerotic center. A three-phase radionuclide bone scan (TPBS) was performed to determine the physiologic and metabolic status of this lesion. The radionuclide angiogram portion (not shown) demonstrated minimal late capillary phase increased activity about the entire proximal phalanx. The blood pool or tissue phase images (part 2 of the TPBS, **Figure 2**) showed mildly increased activity (representing increased vascularity) about the proximal phalanx with a tiny focus of more intense rounded activity distally, corresponding to the area of lucency on the radiograph. This small area does not reproduce well. The delayed image (part 3 of the TPBS, **Figure 3**), in addition to showing mild diffusely increased tracer uptake involving all of the proximal phalanx, demonstrated an intense round area of increased tracer activity also corresponding to the radiographic lucency. These findings were most consistent with an active osteoid osteoma. The lack of intense increased perfusion on the radionuclide angiogram and the focal round activity on the other phases made infection less likely, but not totally excludable. Thin section computed tomography (CT) scanning was done to determine detailed anatomy prior to surgery. Transaxial (**Figure 4**) and direct sagittal (**Figure 5**) sections delineated the extent of reactive sclerosis, the lucent lesion, and the calcified central nidus.

Pathological diagnosis

Focus of reactive bone with prominent osteoblasts, consistent with osteoid osteoma

Discussion

Osteoid osteoma is a benign tumor of bone seen mainly in children and young adults. The actual lesion is a nidus, which appears radiolucent on the radiograph. It is composed of highly vascularized osteogenic connective tissue (focal tracer uptake on blood pool and delayed images). When the nidus is in the cortex, as in this patient, there is significant reactive sclerosis with cortical thickening and a solid periosteal response surrounding the nidus. Initially uncalcified, the nidus often develops calcification within its center.^{1,2}

Pain, often described as deep and aching and worse at night, is the most characteristic symptom of osteoid osteoma. It is not usually relieved by exercise or rest, but about 65 percent of patients report dramatic relief with aspirin. Radionuclide bone scanning has been most useful since pain is usually present for many months prior to radiographic evidence of the lesion.^{3,4}

Osteoid osteoma does not commonly occur in the hand or wrist, with various studies suggesting less than 10 percent of lesions in these areas. Fifty percent of lesions occur in the femur and tibia, while spine lesions involving the lamina, pedicles, and facets are often the cause of unexplained back pain. This patient illustrates the soft tissue swelling that occurs in the fingers and the overgrowth of bone described in children. Differential diagnosis includes Garre's chronic sclerosing osteomyelitis; Brodie's abscess; and, especially in the phalanges, epidermoid cysts, enchondromas, and glomus tumors. Surgery is indicated to relieve intractable pain and restore function. Effective surgery requires complete removal of the nidus.

Metastatic neoplasms from an unknown primary

Approximately 5–10 percent of cancer patients present with signs of metastatic disease, but routine workup usually reveals the site of the primary neoplasm. However, some patients have an occult primary lesion that may go undetected clinically during the entire course of the disease. Even at autopsy, the primary site may not be identified in up to 30 percent of cases.^{1,2} An analysis of over 1,500 patients from the Yale Tumor Registry showed that the proportion of cases with unknown primary cancer was approximately 3 percent per year and that this proportion was fairly constant throughout the decades from the 1940s to 1980, despite advances in diagnostic techniques.³ Although newer procedures, such as magnetic resonance imaging (MRI) scans and monoclonal antibodies, may improve the diagnostic assessment in some of these patients, cancer patients who present with metastatic disease from an uncertain primary remain a unique subset. The evaluation and treatment of these patients must be individualized, based on pathology, location of disease, and clinical status.⁴

Carcinoma of unknown primary (CUP) can generally be divided into three major groups: squamous cell carcinoma, adenocarcinoma, and undifferentiated malignancies. The cell type and the pattern of metastasis can help the clinician narrow down the possible primary sites. For example: a solitary axillary node with adenocarcinoma in a woman is likely to be breast cancer; a cervical node with squamous cell is likely to represent a primary in the head and neck region; and bone metastasis in an elderly man could be due to prostate cancer. Undifferentiated malignancies are especially challenging since the primary site is particularly difficult to assess on the basis of clinical and radiographic findings. However, since these tumors can have a gratifying response to chemotherapy resulting in long-term survival⁵ and even cure, an extensive search for a primary lesion may yield no additional benefit.

The evaluation of patients with metastatic disease should begin with a complete history and physical examination. The examination must include careful attention to the axillary and inguinal nodes, the breasts (both men's and women's), anorectal and genital areas, and the exposed and unexposed skin. Routine laboratory studies (complete blood count, full chemistry profile, and urinalysis) may help to identify other metastatic sites. Chest x-ray is also essential. Bone scan is virtually never helpful in establishing the location of the primary, but may be important in evaluating involvement of weight-bearing bones prone to pathologic fractures. Mammography is relatively inexpensive and should be performed in all women with adenocarcinoma since the implication for specific therapeutic intervention is quite significant. Computed tomography (CT) scans of the abdomen may identify pancreatic or renal tumors, but these malignancies are essen-

tially untreatable. The benefit of gastrointestinal (GI) studies and endoscopy is questionable for patients who have no GI symptoms and who are hematest negative.⁶ MRI probably adds little to the diagnosis and therapy, but few studies have addressed the value of this new modality. Costly evaluations should be initiated only if the results will have an impact on therapeutic decisions.⁴

Biopsy of clinical or radiographic abnormalities is obligatory. Occasionally, the tissue specimen in a patient with widely metastatic disease will yield a specific diagnosis, such as multiple myeloma or malignant melanoma, that may guide treatment decisions. Fine-needle aspiration or CT-directed biopsy is often sufficient to make an initial assessment. However, additional tissue may be required for special pathology studies in difficult cases. Monoclonal antibodies can now be used as immunoperoxidase stains to differentiate lymphoma from carcinoma and to further identify melanoma, germ cell tumors, and several other specific malignancies.⁷ When open biopsy is recommended, the treating physician should carefully consider the diagnostic possibilities in order to facilitate other special studies, such as estrogen receptors and electron microscopy, that may have additional benefit in resolving diagnostic dilemmas.

Patients who present with metastatic carcinoma in the cervical lymph nodes require special diagnostic considerations. When biopsy reveals squamous cell carcinoma, these patients should have complete head and neck examination (from the nasopharynx to the subglottic area) and complete chest evaluation. Open biopsy should be avoided initially, but needle aspiration cytology can be performed at any time. Surgical excision followed by radiation therapy to the neck can result in three-year survival of 30–50 percent, even when the primary lesion is occult. If the metastases in the neck are adenocarcinoma, major attention should be directed to the GI tract and lungs. A clinical history of prior irradiation to the head or neck could suggest an increased risk of thyroid or salivary gland tumors. Thyroid carcinomas may present with palpable cervical nodes, and nucleotide scan can be helpful in that instance. CT scanning of the neck can help to establish the extent of gross disease for treatment planning, but is not more reliable than physical examination in diagnosing minimal disease (i.e., lymph nodes 0.5 cm or less in diameter).

The overall prognosis in patients with CUP is quite poor—with median survival of less than six months—but approximately 10 percent of patients survive five years. The majority of cases are adenocarcinoma, but the pathology is undifferentiated in approximately 30 percent. Despite improvement in the sensitivity of new radiologic procedures, the primary lesion in most patients with CUP remains obscure throughout the clinical illness. Autopsy series reveal that lung cancer is the most likely origin for tumors above the

diaphragm, and pancreatic cancer is most likely for those below the diaphragm, although occult primaries have been identified postmortem in virtually every organ.⁸

CUP is an uncommon clinical syndrome, but several series have been published that provide guidelines for clinical management.⁹⁻¹¹ Patients who have a solitary area of metastatic disease should be treated with local therapy, including surgical excision and locoregional radiation. Female patients occasionally present with peritoneal carcinomatosis with no obvious primary in the ovaries; nevertheless, the pattern of metastatic disease at laparotomy is typical of ovarian cancer, and chemotherapy directed at this disease can induce long-term remissions.¹² Other patients with adenocarcinoma and good performance status can be treated with adriamycin-based regimens that may result in responses in 35 percent of patients. Patients with poorly differentiated carcinomas are an interesting subgroup. Durable complete remissions may be seen in these patients following treatment with platinum combination therapy or with multi-agent regimens commonly used for lymphomas. A directed approach to treatment based on location of disease, histopathology, and pattern of metastasis can result in effective palliation.

In summary, patients with carcinoma of unknown primary represent a heterogeneous group. Evaluation should be individualized based on potential treatment strategies. The search for a primary lesion begins with careful review of the pathology, although the identification of the primary usually eludes the clinician if the initial examination and workup is negative. Patients with localized disease should be treated with local therapies (surgery and/or radiation). Metastatic disease can be treated with empiric chemotherapy regimens using adriamycin or platinum, based on assessment of certain clinical features. Although the average survival is quite short, some patients respond well to therapy and survive five years or more, justifying aggressive therapy in patients with good performance status.

Board of Physician Quality Assurance Actions

In the matter of
Yin Chuan Hung, M.D.
before the
Maryland Board of
Physician Quality Assurance

Order terminating probation and reinstating license

By Order dated January 19, 1988 (the 1988 Order), the Commission on Medical Discipline (the Commission), predecessor agency to the Board of Physician Quality Assurance (the Board), found Yin Chuan Hung (the Respondent) guilty of committing prohibited acts as set forth in Health Occupations Article, *Annotated Code of Maryland* (HO) §14-504. Specifically, the Commission found Respondent guilty of §14-504(4). The Commission suspended the Respondent's license and stayed the suspension, conditioned upon the Respondent complying with conditions of probation (the Conditions of Probation). The Order further provided that on or after February 1, 1991, if the Respondent demonstrated to the Board's satisfaction that Respondent had complied with the terms and condition of his probation, the Board would entertain a petition for altering the terms of Respondent's probationary status.

By letter dated September 12, 1991, Respondent petitioned the Board for Termination of Probationary Status and Reinstatement of His License (Petition) to practice medicine in Maryland. At its meeting on October 9, 1991, the Board, through its Case Resolution Conference (the Conference), reviewed Respondent's Petition.¹ Based upon the Board's review of the Petition, the Board determined that Respondent has fulfilled the Conditions of Probation contained in the 1988 Order.

Findings of fact and conclusions of law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions of probation as set forth in the 1988 Order.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 15th day of October 1991

ORDERED that effective as of the date of this Order, the Conditions of Probation imposed upon Respondent's practice of medicine by the Board's 1988 Order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED that Respondent's license to practice medicine in the state of Maryland be REINSTATED without any condition or restriction whatsoever; and be it further

1. At its meeting on June 26, 1991, the Board delegated to the Conference the responsibility of reviewing and evaluating petitions for reinstatement of licenses without probationary conditions. If the Conference determines that all probationary conditions have been met, the petitioner's license will be reinstated without conditions upon the Board Chairperson's execution of an Order terminating the conditions.

ORDERED that this is a Final Order and as such is considered a public document pursuant to the Maryland Public Information Article, State Government Article, *Annotated Code of Maryland*, §§10-611 *et seq.*, specifically §10-617(h)(2)(vi).

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

In the matter of
Abdoul Edward Komeh, M.D.
before the
Maryland Board of
Physician Quality Assurance

Final order

On June 20, 1990, Abdoul Edward Komeh, M.D. (the Applicant) applied to the Board of Physician Quality Assurance (the Board) for reinstatement of medical licensure. The Board, pursuant to the Maryland Medical Practice Act (the Act), *Md. Health Occ. Code Ann.* (HO) §14-205, notified the Applicant that there was reason to issue an initial denial of the Applicant's application for reinstatement of licensure.

Pursuant to HO §14-205(a)(1)(iii), the Board found that there were grounds for action under HO §14-404. Specifically, the Board charged that the Applicant:

Fraudulently or deceptively obtains or attempts to obtain a license for the applicant ...; [HO §14-404 (a)(1)].¹

Willfully makes or files a false report or record in the practice of medicine; [HO §14-404(a)(11)].²

Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state ... for an act that would be grounds for disciplinary action under this section. [HO §14-404(a)(21)].³

Is convicted of or pleads guilty ... with respect to a crime involving moral turpitude ...; [HO §14-404(b)].⁴

The grounds for disciplinary action under HO §14-404(a)(21) are as follows:

1. Section 1, Chapter 109, Acts 1988, effective July 1, 1988, recodified former HO §14-504(1) as HO §14-504(a)(1). Section 11, Chapter 6, Acts 1990, approved February 16, 1990, effective on or about January 1, 1991, renumbered HO §14-504(a)(1) as HO §14-404(a)(1).
2. Section 1, Chapter 109, Acts 1988, effective July 1, 1988, recodified former HO §14-504(12) as HO §14-504(a)(11). Section 11, Chapter 6, Acts 1990, approved February 16, 1990, effective on or about January 1, 1991, renumbered HO §14-504(a)(11) as HO §14-404(a)(11).
3. Section 1, Chapter 109, Acts 1988, effective July 1, 1988, recodified former HO §14-504(22) as HO §14-504(a)(21). Section 11, Chapter 6, Acts 1990, approved February 16, 1990, effective on or about January 1, 1991, renumbered HO §14-504(a)(21) as HO §14-404(a)(21).
4. Section 1, Chapter 109, Acts 1988, effective July 1, 1988, deleted HO §14-504(6) and enacted HO §14-504(b). Section 11, Chapter 6, Acts 1990, approved February 16, 1990, effective on or about January 1, 1991, renumbered HO §14-504(b) as HO §14-404(b).

Board of Physician Quality Assurance Actions

Fraudulently or deceptively obtains or attempts to obtain a license for the applicant ...; [HO §14-404(a)(1)].

Is guilty of immoral or unprofessional conduct in the practice of medicine; [HO §14-404(a)(3)].⁵

Willfully makes or files a false report or record in the practice of medicine; [HO §14-404(a)(11)].

Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state ... for an act that would be grounds for disciplinary action under this section; [HO §14-404(a)(21)].

Is convicted of or pleads guilty ... with respect to a crime involving moral turpitude ...; [HO §14-404(b)].

Pursuant to HO §14-317(1), HO §14-316(c)(1), and HO §14-307(b), the Board notified the Applicant that there was reason to issue an initial denial of the application for reinstatement of licensure in that the Applicant failed to meet the requirements under the Act with regard to license reinstatements. The Applicant does not qualify for licensure in that he is not of good moral character.

The Applicant, on July 17, 1991, requested a hearing on the Intent to Deny. On August 15, 1991, Notice of the Hearing was sent to the Applicant advising him that a prehearing conference would be conducted on September 26, 1991 at 9:00 a.m., and the hearing would commence on October 2, 1991 at 9:00 a.m. The Applicant did not present himself for the prehearing conference. A subsequent letter was sent to him by the administrative prosecutor advising him that the time of the hearing would be changed from 9:00 a.m. on October 2, 1991 to 5:00 p.m. on October 2, 1991. No response was received from the Applicant, and, on October 2, 1991, the administrative law judge and the administrative prosecutor were present for the hearing at 5:00 p.m. Robert J. Gilbert, Esquire, the administrative prosecutor, advised the administrative law judge, at the time of the hearing, that he had placed a telephone call to the number given to him by the Applicant and was told that the Applicant was no longer in the jurisdiction. The Applicant did not present himself for the hearing. The hearing was conducted without the presence of the Applicant.

Summary of the evidence

The following documents were duly admitted into the record by the administrative prosecutor:

Exhibit A. Judgment, Probation, and Commitment Order from the United States District Court for the District of New Jersey.

Exhibit B. Copy of the Government of the District of Columbia Commission on Licensure to Practice the

Healing Art's Findings of Fact, Conclusions of Law, and Order to revoke the license of the Applicant, dated October 4, 1985.

Exhibit C. The state of Tennessee Department of Health and Environment Order of Summary Suspension, dated December 15, 1989.

Exhibit D. A Criminal Information issued by the state of Tennessee, Davidson County, Judgment and Docket entries evidencing a conviction for Medicaid fraud.

Exhibit E. The Notice of Intent to Deny Application for Reinstatement of Licensure under the Maryland Medical Practice Act issued on June 26, 1991.

As the Applicant did not appear, there was no evidence or testimony presented on his behalf.

There were no witnesses presented by the Board. The documents listed above comprised all of the evidence presented.

Findings of fact

A. The Board finds as follows:

1. The Applicant, Abdoul Edward Komeh, M.D., filed an application for reinstatement of licensure on June 20, 1990.
2. The Applicant was notified by the Board on June 26, 1991 that there was reason to issue an initial denial of the Applicant's application for reinstatement of licensure.
3. The Applicant was informed that a Final Order denying the application for reinstatement of licensure would be entered 30 days from the Applicant's receipt of the Board's Notice, unless the Applicant requested a hearing.
4. The Applicant received the Board's Notice of Intent to Deny, and on July 17, 1991, he requested a hearing.
5. The Applicant was notified of the date, time, and place of the prehearing conference and hearing by letter dated August 15, 1991.
6. The Applicant did not appear for the prehearing conference on September 26, 1991 at 9:00 a.m.
7. The administrative prosecutor advised the Applicant, by letter, that the time of the hearing had been changed from 9:00 a.m. to 5:00 p.m. on October 2, 1991.
8. The administrative prosecutor, having not heard from the Applicant, placed a call to him at the number given to him by the Applicant. The administrative prosecutor was told that the Applicant no longer resided in this jurisdiction.
9. The Applicant did not appear for the hearing on October 2, 1991 at 5:00 p.m.
10. The hearing was conducted without the presence of the Applicant.

B. The Board further finds

1. The Applicant was initially licensed to practice medicine by the Tennessee Board of Medical Examiners on or about March 20, 1979.

5. Section 1, Chapter 109, Acts 1988, effective July 1, 1988, recodified former HO §14-504(3) as HO §14-504(a)(3), and inserted the below italicized words in the existing statute: Is guilty of immoral or unprofessional conduct in the practice of medicine. Section 11, Chapter 6, Acts 1990, approved February 16, 1990, effective on or about January 1, 1991, renumbered HO §14-504(a)(3) as HO §14-404(a)(3).

Board of Physician Quality Assurance Actions

2. The Applicant was initially licensed to practice medicine in the state of Maryland on or about June 21, 1979. The Applicant's Maryland medical license lapsed for failure to renew on September 30, 1980.
3. The Applicant was initially licensed to practice medicine in the District of Columbia on or about June 17, 1981.
4. The Applicant's Tennessee medical license was automatically revoked in 1981 for failure to renew and to pay the annual license fee pursuant to *Tennessee Code Annotated* (TCA) 63-6-210(b).
5. On or about May 13, 1983, the Applicant, in the matter of *United States of America v Abdoul Edward Komeh, M.D.*, under docket number Cr. 82-00386(01), was convicted upon a plea of guilty in the United States District Court for the District of New Jersey, for the offense of conspiracy to commit fraud and bribery, a felony, in violation of Title 18, *United States Code*, Section 1343.

In this matter, it was alleged that the Applicant conspired to: (1) travel in interstate commerce with the intent to carry on the unlawful activity of bribing an employee of the National Board of Medical Examiners (NBME) in violation of the laws of the states of New Jersey and Pennsylvania; and (2) utilize interstate telephone calls to carry on a scheme to defraud the citizens of the United States and the NBME by obtaining advance test questions for examinations given by the NBME and distributing the questions to persons taking the examinations.

As a result of this conviction, the Applicant's sentence was imposed and suspended. The Applicant was placed on supervised probation for a period of three years, and was ordered to pay a fine of \$5000.00.

6. Pursuant to an Order dated October 4, 1985, the Commission on Licensure to Practice the Healing Art of the District of Columbia revoked the Applicant's license to practice medicine in the District of Columbia after finding that the Applicant violated *DC Code*, §2-1326(d)(2), in that the Applicant's

[C]onviction of conspiracy to commit fraud and bribery to illegally obtain prior access to standardized medical examinations administered throughout the country and to distribute those examinations (a violation of Title 18, *United States Code*, Section 1343, referred to above in section 5) has a direct bearing on whether he should be entrusted to serve the public as a licensed health care provider ... [the Applicant's] demonstrated disdain for the right of the public to be able to rely upon licensed health care providers to be competent practitioners evidences an attitude so callous to the health, safety and welfare of patients that ... [the Applicant] is not fit to practice medicine.

7. On or about September 2, 1986, the Applicant's Tennessee medical license was reinstated pursuant to TCA §63-6-210(c), upon receipt of a complete application and payment of licensing fees.
8. On or about December 15, 1989, the Tennessee Board of

Medical Examiners, pursuant to a document entitled "Order of Summary Suspension," summarily suspended the Applicant's license to practice medicine in Tennessee, finding that the "public health, safety, and welfare imperatively require emergency action to prevent ... [the Applicant] from continuing to practice medicine under a license obtained by fraud and deceit, from continuing malpractice in ... [the Applicant's] use of x-rays, and ... [the Applicant's] conviction of ... [a] felony involving conspiracy and fraud."

The findings of fact supporting the Order of Summary Suspension included findings that the Applicant: failed to renew his license to practice medicine in the states of Maryland and Tennessee in 1980 and 1981, respectively; was convicted, in federal court, on May 13, 1983 of conspiracy to commit fraud and bribery (described in section 5 above); made material misrepresentations to the Tennessee Board of Medical Examiners in 1985 and 1986 regarding his medical licensure status and criminal record in seeking reinstatement of his Tennessee medical license (resulting in the Tennessee Board of Medical Examiner's reliance on those averments in granting reinstatement of licensure); had his medical license revoked in 1985 in the District of Columbia by the Commission on Licensure to Practice the Healing Art of the District of Columbia (described in section 6 above); and engaged in fraudulent and/or inappropriate billing practices and inappropriate, excessive, or unauthorized utilization of radiologic equipment on patients in Tennessee on or about July 1987.

In summarily suspending the Applicant's medical license, the Tennessee Board of Medical Examiners found that the findings of fact contained in the Order of Summary Suspension were sufficient to establish that the Applicant violated the following provisions of TCA §63-6-214:

- a. Unprofessional, dishonorable, or unethical conduct. TCA §63-6-214(a)(1).
- b. Violation or attempted violation, directly or indirectly, or assisting in or abetting in the violation of, or conspiring to violate, any provision of this chapter or any lawful order of the Board issued pursuant thereto, or any criminal statute of the state of Tennessee. TCA §63-6-214(a)(2).
- c. Making false statements or representations, being guilty of fraud or deceit in obtaining admission to practice, or in being guilty of fraud or deceit in the practice of medicine. TCA §63-6-214(a)(3).
- d. Gross malpractice, or a pattern of continued or repeated malpractice, ignorance, negligence, or incompetence in the course of medical practice. TCA §63-6-214(a)(4).
- e. Conviction of a felony, conviction of any offense under state or federal drug laws, or conviction of any offense involving moral turpitude. TCA §63-6-214(a)(10).

In support of its decision to summarily suspend the Appli-

Board of Physician Quality Assurance Actions

cant's medical license, the Tennessee Board of Medical Examiners stated that

[The Applicant's] repeated acts of deceit and fraud have a direct bearing on his competency to practice medicine and to be entrusted to serve the public. [The Applicant's] demonstrated disdain for the right of the public to rely on their doctor to be competent and forthright evidences an attitude so callous to the health, safety, and welfare of patients that . . . [the Applicant] is not fit to practice medicine.

It is incumbent on all physicians to exercise the highest degree of professional care in performing x-rays on patients. The failure to do so can lead to harmful effects.

The public is entitled to entrust its health to physicians who show sound medical judgment and competency. A physician who is lacking in proper ethics, requisite medical judgement, and competency has the distinct propensity to harm his patients. It is the purpose and duty of the Board of Medical Examiners to protect the public from such physicians.

The conduct engaged in by . . . [the Applicant] cannot be tolerated by the Board of Medical Examiners and requires strict and swift action in order to protect the public health, safety, and welfare.

9. On or about January 11, 1990, the Tennessee Department of Health and Environment, pursuant to its authority under TCA §63-6-201 *et seq.*, charged the Applicant with disciplinary violations under TCA §63-6-214(a)(1), (2), (3), (4) and (10) (described in section 8 above). The allegations raised in this disciplinary action are pending at this time.
10. On or about October 5, 1990, the Applicant, in the matter of *State of Tennessee v Abdoul E. Komeh*, under criminal information number IF-5829, was convicted upon a plea of guilty in the Criminal Court of Davidson County, Tennessee, for the offense of obtaining money by false pretenses, a class E felony, in violation of TCA §39-14-103.

In this matter, it was alleged that the Applicant, during the period October 1987 through May 1989, pursuant to a single continuous larcenous scheme, obtained money by false pretenses by defrauding the Tennessee State Medicaid Program. As a result of this conviction, the Applicant was sentenced to a term of incarceration of one year, to be followed by a period of probation of one year, and was ordered to pay restitution in the amount of \$210,000.00 within two weeks of the date of the guilty plea.

11. The crime for which the Applicant was convicted in the United States District Court for the District of New Jersey on May 13, 1983, in the matter of *United States v Abdoul Edward Komeh, M.D.*, under docket number Cr. 82-00386(01), conspiracy to commit fraud and bribery, is a crime involving moral turpitude.
12. The crime for which the Applicant was convicted in the

Criminal Court of Davidson County, Tennessee, on October 5, 1990, in the matter of *State of Tennessee v Abdoul E. Komeh*, under criminal information number IF-5829, obtaining money under false pretenses, is a crime involving moral turpitude.

13. In Maryland, the act of making material misrepresentations in seeking reinstatement of medical licensure would be grounds for disciplinary action under the Act under HO §14-404(a)(1) and HO §14-404(a)(11).
14. In Maryland, conviction for defrauding a state Medicaid program would be grounds for disciplinary action under the Act under HO §14-404(a)(11), HO §14-404(a)(21) (with underlying grounds under HO §14-404(a)(3) and HO §14-404(a)(11) and HO §14-404(b).
15. In Maryland, conviction for conspiracy to commit fraud and bribery would be grounds for disciplinary action under the Act under HO §14-404(a)(21) (with underlying grounds under HO §14-404(b)), and HO §14-404(b).
16. In Maryland, the act of engaging in fraudulent and/or inappropriate billing practices would be grounds for disciplinary action under the Act under HO §14-404(a)(11).
17. In Maryland, the acts of being revoked by the Commission on Licensure to Practice the Healing Art of the District of Columbia and of being suspended by the Tennessee Board of Medical Examiners would be grounds for disciplinary action under the Act under HO §14-404(a)(1), HO §14-404(a)(11), HO §14-404(a)(21) (with underlying grounds under §14-404(a)(21) and §14-404(b)), and HO §14-404(b).
18. The Board has been charged with the responsibility of regulating the practice of medicine in the state of Maryland. HO §14-101 *et seq.* As such, the Board is empowered with the authority to assess both the competence and the moral character of those individuals who seek licensure, renewal, or reinstatement of medical licensure in Maryland. In order to be considered for reinstatement of licensure, a physician shall be of good moral character. [HO §14-317(1), HO §14-316(C)(1) and HO §14-307(b).] In assessing good moral character, the Board attempts to make a determination of the physician/applicant's integrity, trustworthiness, credibility, and reputation for honesty.

In making the determination of whether the physician/applicant possesses good moral character, the Board evaluates the physician/applicant's background in general and, specifically, with regard to his actions within the medical community. Such considerations as: the physician/applicant's criminal record, particularly as it relates to the practice of medicine; his truthfulness in disclosing details of his background when so requested by state licensing agencies; his prior relationship to the medical community, including any prior medical licensure and disciplinary actions previously

Board of Physician Quality Assurance Actions

taken against him by a state medical licensing agency; and integrity in the practice of medicine are all relevant factors in the Board's determination of good moral character.

The Applicant has been convicted, both in federal court in 1983 and in Tennessee state court in 1990, of actions clearly amounting to crimes involving moral turpitude. These convictions, which were based on fraud, deceit, and false pretenses, all of which involve the medical community and the practice of medicine, are reflective on any determination of the quality of the Applicant's moral character. Furthermore, the District of Columbia government revoked the Applicant's license to practice medicine in the District of Columbia for the aforementioned federal felony fraud conviction. In addition, the Applicant had been summarily suspended by the Tennessee Board of Medical Examiners after it found that the Applicant engaged in: unprofessional, dishonorable, or unethical conduct; making false statements or representations in obtaining admission to practice or in being guilty of fraud or deceit in the practice of medicine; gross malpractice, or a pattern of continued or repeated malpractice, ignorance, negligence or incompetence in the course of medical practice; and in being convicted of a felony and/or offense involving moral turpitude.

The Applicant's convictions for crimes involving moral turpitude, coupled with the disciplinary actions taken against him by the licensing authorities of the District of Columbia and Tennessee, all clearly indicate well-defined instances of fraud, deceit, unprofessional conduct, lack of integrity, and a lack of good moral character. This series of criminal convictions and disciplinary sanctions collectively establish that the Applicant does not possess the good moral character required for medical licensure in the state of Maryland.

Conclusions of law

Based on the foregoing Findings of Fact, the Board concludes as a matter of law under HO §14-205 that the Applicant has committed the following prohibited acts under HO §14-404. They include the following:

1. The Applicant fraudulently and/or deceptively obtained a license to practice medicine, under HO §14-404(a)(1);
2. The Applicant willfully made or filed a false report or record in the practice of medicine, under HO §14-404(a)(11);
3. The Applicant was disciplined by a licensing or disciplinary authority or disciplined by a court of any state ... for an act that would be grounds for disciplinary action under this section, under HO §14-404(a)(21). The underlying grounds actionable under this section include the following:

Fraudulently or deceptively obtains or attempts to obtain a license for the applicant ...; [HO §14-404(a)(1)].

Is guilty of immoral or unprofessional conduct in the practice of medicine; [HO §14-404(a)(3)].

Willfully makes or files a false report or record in the practice of medicine; [HO §14-404(a)(11)].

Is disciplined by a licensing or disciplinary authority or disciplined by a court of any state ... for an act that would be grounds for disciplinary action under this section; [HO §14-404(a)(21)].

4. The Applicant was convicted of crimes involving moral turpitude, under HO §14-404(b).

Furthermore, the Board has determined that the Applicant has failed to meet the requirements under HO §14-317(1), HO §14-316(c)(1), and HO §14-307(b) with regard to license reinstatements insofar as the Applicant is not of good moral character.

Order

After reviewing the application of Abdoul Edward Komeh, M.D., former license number D23626, for reinstatement of medical licensure, it is this 27th day of November, 1991, by an affirmative vote of a majority of the full authorized membership of those members of the Board of Physician Quality Assurance who considered this case,

ORDERED that the application of Abdoul Edward Komeh, M.D. for reinstatement of his license to practice medicine in the state of Maryland is DENIED; and be it further

ORDERED that this is a FINAL ORDER and as such will be considered a public document pursuant to *Md. State Gov't. Code Ann.* §10-611 *et seq.*

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

In the matter of
Waheeda S. Qaiyumi, M.D.
before the
Maryland Board of
Physician Quality Assurance

Amended final order reinstating license

By Final Decision dated November 6, 1989, the Board of Physician Quality Assurance (the Board) voted to revoke the license of Waheeda S. Qaiyumi, M.D. (the Respondent). The Final Decision stated that on or after October 1, 1990, Respondent could petition the Board for reinstatement of her license but that in no event would the Respondent's license be reinstated prior to November 27, 1990. Respondent petitioned the Board through its Settlement Conference for reinstatement of her license on December 5, 1990.

Board of Physician Quality Assurance Actions

At its meeting on December 12, 1990, the Board considered the Settlement Conference's recommendation and voted to amend its Final Order. By Order dated December 21, 1990, the Board ordered that it would not consider the petition for reinstatement from Respondent until such time as Respondent submits evidence of successfully completing certain conditions. The Order provided that in the event that the Board stays the revocation of Respondent's license and thus reinstates the Respondent's license, the Board can impose any additional reasonable conditions of probation. After having received necessary documentation indicating that the Respondent had successfully completed those conditions imposed by the Amended Final Order, at its meeting on August 28, 1991, the Board's Case Resolution Conference (Conference) decided that the Respondent had successfully fulfilled the conditions contained in the December 21, 1990 Order.¹

Findings of fact

1. The Respondent provided documentation that she had completed all continuing medical education requirements for three years preceding the time of the petition for reinstatement;
2. The Respondent submitted evidence of having completed continuing medical education courses in medical billing;
3. The Respondent took and passed the June 1991 Special Purpose Examination (SPEX) of the Federation of State Medical Boards; and
4. On August 13, 1991, the Respondent was evaluated by Frank A. Oski, M.D., professor, Department of Pediatrics, Johns Hopkins Hospital. In his evaluation report to the Board, Dr. Oski stated that he found the Respondent to be medically qualified to return to the practice of pediatric medicine in the state of Maryland.

Conclusions of law

The Board incorporates by reference the conclusions of law contained in its Amended Final Decision of December 21, 1991 and further concludes that Respondent's license is REINSTATED subject to certain conditions of probation.

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 12th day of September 1991, by the Board, hereby:

ORDERED that Respondent's license to practice medicine in the state of Maryland be REINSTATED; and be it further

ORDERED that the Respondent shall submit to a peer

review of her practice on a biannual basis for a period of three years from the effective date of this Order. The first review is to be performed on or about March 1, 1992. If the Board should receive a peer review report indicating that Respondent is failing to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care under §14-404(a) (22) of the Act, the Board MAY VACATE THE STAY OF REVOCATION, provided that Respondent is given notice of the Board's action and an opportunity for a hearing within 30 days after the Respondent requests a hearing; and be it further

ORDERED that, three years after the effective date of the Order, that being the date on which the Board signs the Order, Respondent may petition the Board for termination of probation and reinstatement of her license without any conditions or restrictions; and be it further

ORDERED that this Order is considered a public document pursuant to the Maryland Public Information Article, *Maryland State Government Code Annotated*, §§10-611 *et seq.*, specifically §10-617(h)(2)(vi).

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Consent

By signing this Order, I hereby accept and agree to be bound by the foregoing Order and its conditions and restrictions consisting of five pages.

1. I acknowledge the validity of this Amended Final Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.
2. I, Waheeda S. Qaiyumi, M.D., have read this Consent Order and have carefully reviewed each and every part with my attorney, David S. Harvis, Esquire. I understand it and voluntarily agree to it.
3. I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning and the terms of the Order.

WAHEEDA S. QAIYUMI, M.D. ■

■ ■ ■
In the matter of
Gregory R. Valcourt, C.R.T.
before the
Maryland Board of
Physician Quality Assurance

Order terminating probation and reinstating
certification

By Order dated October 24, 1990 (the 1990 Order), the Board of Physician Quality Assurance (the Board) found Gregory R. Valcourt (the Respondent), Cardiac Rescue

1. At its meeting on June 26, 1991, the Board delegated to the Conference the responsibility of reviewing and evaluating petitions for reinstatement of license. If the Conference determines that all conditions have been met, the petitioner's license will be reinstated upon the Board chairperson's execution of an order reinstating the license.

Board of Physician Quality Assurance Actions

Technician (C.R.T.), guilty of committing prohibited acts as set forth under *Md. Health Occ. Code Ann.* §14-303(c). The Board charged Respondent under COMAR 10.31.06.02.A.(9) which states "Fraudulent or deceitful procurement or use of a certification." The Board further charged Respondent under the provisions in COMAR 10.32.06, which state, "A cardiac rescue technician may be de-certified if he fails to meet the annual performance re-certification requirements set forth in Regulation .09. See COMAR 10.32.06.11.A." The Board revoked Respondent's certification to practice as a C.R.T. and stayed the revocation, conditioned upon the Respondent complying with conditions of probation (the Conditions of Probation). The Order further provided that after August 6, 1991, but not later than September 6, 1991, if the Respondent demonstrated to the Board's satisfaction that Respondent had complied with the terms and conditions of his probation, the Board would entertain a petition for altering the terms of Respondent's probationary status.

By letter dated August 1, 1991, Respondent petitioned the Board for Termination of Probationary Status and Reinstatement of his Certification (Petition) to practice medicine in Maryland. At its meeting on September 11, 1991, the Board, through its Case Resolution Conference (the Conference), reviewed Respondent's Petition.¹ Based upon the Board's review of the Petition, the Board determined that Respondent had fulfilled the Conditions of Probation contained in the 1990 Order.

Findings of fact

Based on the information known and available to it, the Board finds that:

1. Respondent has not practiced as a C.R.T. since July 25, 1991, and does not intend to practice as a C.R.T. until the Board reinstates him.
 2. By letter dated October 24, 1991 and received by the Board on October 25, 1991, Respondent requested
1. At its meeting on June 26, 1991, the Board delegated to the conference the responsibility of reviewing and evaluating petitions for reinstatement of licenses without probationary conditions. If the Conference determines that all probationary conditions have been met, the petitioner's license will be reinstated without conditions upon the Board Chairperson's execution of an Order terminating the conditions.

George S. Everly, Jr., Ph.D. be approved as his psychologist. By letter dated December 10, 1991, the Board approved Dr. Everly as Respondent's psychologist. The visits with Dr. Everly were scheduled on a weekly, and later, on a biweekly basis. In his final report dated July 19, 1991, Dr. Everly wrote that Respondent had successfully completed the psychotherapy and that Respondent should be allowed to practice as a C.R.T.

3. The releases, permitting the therapist to report to the Board, were received by the Board on July 23, 1991.
4. Respondent successfully completed the "Introduction to Ethics" course given during the spring semester of 1991 at Howard Community College.
5. Respondent has met the certification requirements to practice as a C.R.T.
6. Respondent met with Robert A. Lessey, M.D. for an evaluation on July 30, 1991. Dr. Lessey recommends that Respondent be permitted to return to practice as a C.R.T.

Conclusions of law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions of probation as set forth in the 1990 Order.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is, this 24th day of September 1991, by a majority vote of the full authorized membership of the Board

ORDERED that effective as of the date of this Order, the Conditions of Probation imposed upon Respondent's practice of medicine by the Board's 1990 Order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED that Respondent's license to practice medicine in the State of Maryland be REINSTATED without any condition or restriction whatsoever; and be it further

ORDERED that this is a Final Order and as such is considered a public document pursuant to the Maryland Public Information Article, State Government Article, *Annotated Code of Maryland*, §§10-611 *et seq.*, specifically §10-617(h)(2)(vi).

Maryland Board of Physician Quality Assurance

Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201-5585
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland. **MMJ** announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Update: *Salmonella enteritidis* associated with shell eggs

February, 1992

In previous articles in the Maryland Medical Journal we have reviewed the problem of Salmonella enteritidis associated with shell eggs. Cases and outbreaks continue to occur. Health care professionals need to be aware of the association between the consumption of raw or under-cooked eggs or egg-containing foods and gastroenteritis, especially in high risk individuals.

Introduction

From 1976 through 1985, the mid-Atlantic and north-east regions of the United States experienced a five-fold increase in reported isolates of *Salmonella enteritidis* (SE)^{1,2}. Since 1985, this increase has continued and has spread to other parts of the country (Figure 1).³ Initially egg-associated outbreaks were thought to be due to external contamination of shells;¹ however, recent evidence suggests that internal contamination via trans-

ovarian transmission is the predominant mechanism leading to SE infected eggs.⁴

In Maryland, from January, 1987, through November, 1991, SE was the most common serotype of *Salmonella*, accounting for 25-37% of serotyped isolates annually (Figure 2). While reported cases of salmonellosis have declined during this period, SE outbreaks continue to occur (Table 1). Between January, 1987 and December, 1991, 91 outbreaks of salmonellosis were reported in Maryland, 45 (49%) of which were caused by SE. Forty percent (18 of 45) of these SE outbreaks were associated with shell eggs or egg-containing foods. Egg-associated outbreaks have been a significant source of morbidity, with a 12% (40/343) hospitalization rate among affected individuals. No deaths occurred from the SE outbreaks.

This report summarizes four egg-associated outbreaks that occurred in Maryland which illustrate key issues relevant to the prevention of morbidity associated with this mode of SE transmission.

Outbreak A

Fifteen patrons developed gastroenteritis (GE) after eating at restaurant A during an 18 day period. Further investigation revealed that seven employees had a similar illness during the same period. The predominant symptoms were diarrhea (82%), nausea (54%), and fever (50%). Median incubation was 24 hours (range 5-128 hours); median duration of illness was eight days (range 1-30 days). Eleven patrons sought medical care and two were hospitalized. None of the employees sought medical care. SE was isolated from the stool of 11 ill patrons, two of seven ill employees, and six of 41 employees who did not report illness.

Figure 1. Isolation rate* of *Salmonella enteritidis*, by region--
United States, 1976-1989

* Per 100,000 population.

Figure 2. Reported cases of *Salmonella* and *S. enteritidis*--
Maryland, 1985-November, 1991.

Eleven of 15 ill patrons consumed lightly cooked whole eggs (eggs "over easy") or dishes prepared with pooled eggs. Only two of 13 employees (7 ill and 6 asymptomatic with SE in stool) had a similar food history.

Eggs were delivered twice per week at ambient temperature by an unrefrigerated truck and stored at room temperature until use. Eggs were pooled by mixing 270 hand-cracked eggs with one-half gallon of cold water. This mixture was then refrigerated until use. Small quantities of pooled eggs were temporarily kept in a metal pan adjacent to the grill prior to cooking. During inspection the pool mixture in this pan was found to be 60°F, well above the recommended $\leq 45^\circ\text{F}$. Occasionally, eggs from new and old pools were combined in this pan. Cultures of pooled eggs taken from both the walk-in refrigerator and the grill-side storage pan yielded fecal coliforms (1500 and 2900 organisms/100 gm, respectively), but no *Salmonella*.

Outbreak B

Fifteen patrons from six parties developed GE after eating at restaurant B during an eight day period. Predominant symptoms were diarrhea (100%), fever (92%), abdominal cramping (92%), and nausea

(92%). The median incubation period was 24 hours (range 12-48 hours); median duration of illness was seven days (range 4-10 days). Thirteen cases sought medical care, eight required intravenous rehydration, and six were hospitalized. *Salmonella* group D was isolated from the stool of 13 of the ill patrons; eight of these 13 were confirmed as SE. Fourteen of 15 cases ate Caesar salad; none of the 11 well individuals who ate in these parties ate Caesar salad ($p < 0.0001$).

Further investigation revealed that 32% (25/77) of employees reported symptoms consistent with GE during the period of the outbreak. Predominant symptoms were diarrhea (88%), abdominal cramps (72%), and fever (56%). Median date of onset was the same for both employees and patrons. Median duration of illness was five days among employees (range 1-10). Only two employees sought medical care; none were hospitalized.

Sixteen (64%) of the 25 ill employees had SE isolated from stool specimens. Four of the 52 employees with no reported illness had SE isolated from their stool. Three of four employees who reported eating Caesar salad during the outbreak were confirmed SE cases; however, the majority of confirmed employee cases (19/22) did not report eating this dish. Consumption of any of the restaurant's raw shell egg-containing dishes was not a risk factor for SE infection among employees (relative risk 0.84; 95% CI: 0.59-1.21).

Caesar salad dressing was prepared early in the morning by combining yolks from hand-cracked eggs with olive oil, anchovies, garlic, and warm water. The dressing was stored in a refrigerator until the restaurant opened, when it was placed in a "refrigerated" salad prep area until it was exhausted or the restaurant closed. By the time of inspection, Caesar salad had been eliminated from the menu by the restaurant management. However, during inspection other salad dressings in this preparation area were found to be 60°F. Culture of a test batch of Caesar salad dressing prepared during the inspection did not yield *Salmonella*.

Table 2. Reported Outbreaks of Salmonellosis, Maryland, January, 1987-November, 1991.

Year	Salmonella Outbreaks (all serotypes)	<i>S. enteritidis</i> (SE) Outbreaks	Egg-associated SE Outbreaks*	In Egg-associated SE Outbreaks		
				Persons Ill	Culture Confirmed	Hosp.
1987	17	7	1	10	9	5
1988	20	8	4	70	40	15
1989	15	10	3	74	33	0
1990	23	15	7	119	60	7
1991	16	5	3	70	55	10
Total	91	45	18	343	197	40

*Includes SE outbreaks with either probable or definite egg association

Eggs were received twice per week and stored in a walk-in refrigerator until use. Eggs from the shipment implicated in the outbreak were not available at the time of inspection; three cases of eggs delivered subsequently from the same farm were available for testing. Six pools of ten eggs each were sampled from these cases and submitted for culture. SE was isolated from one of the pools.

Outbreak C

Eleven preschool-age children developed symptoms of GE after consuming a banana milkshake prepared by a teacher at a day care center. No children were hospitalized. Eighteen children and three adults each consumed an average one-to-two ounces of the milkshake. Eight of the children's stool cultures yielded SE, two of whom were asymptomatic.

The teacher prepared the milkshake by mixing pasteurized skim milk with commercially prepared vanilla ice cream, one banana, and one raw shell egg in a clean blender. It was served and consumed immediately after preparation. Ingredients, including one carton of grade A extra large eggs, had been purchased on the morning of preparation and were stored in a refrigerator for approximately two hours until the time of preparation. The teacher was the only individual involved in preparation of the milkshake. The teacher had no symptoms of GE; both stool specimens submitted for culture were negative. Neither the milkshake nor its ingredients were available for culture at the time of investigation.

Outbreak D

Nineteen students and three teachers developed GE after consuming homemade ice cream prepared in a school classroom. Predominant symptoms were diarrhea (100%), abdominal pain (87%), fever (87%), headache (63%), and nausea (59%). Mean incubation was 20 hours (range 4-67 hours) and mean duration was eight days (range 3-12 days). Thirteen cases sought medical care, five required intravenous rehydration, and two were hospitalized. All 22 cases were confirmed by isolation of *Salmonella* group D or SE. None of the 21 students who did not eat the ice cream was ill.

Ingredients were purchased on the morning the ice cream was prepared. They were stored in a refrigerator for several hours prior to preparation. Six hand-cracked shell eggs were mixed with milk and sugar and then were cooked over low heat for 10-15 minutes until the mixture thickened. It was removed from heat and cooled for 10 minutes, then the remaining ingredients (whipping cream and vanilla extract) were added. This mixture was then cooled 10 minutes in the refrigerator, after which it was poured into the cold ice cream maker and stirred for 35 minutes. The ice cream was then placed in a freezer for one hour prior to being served to one class. It was then returned to the freezer until being served the next class. Both classes had cases of SE.

Egg Tracing

In outbreaks A, C, and D, SE was isolated from the layer flocks which produced the eggs associated with the outbreaks. Phage types of SE isolates from the implicated flocks were identical to that of cases in each of these three outbreaks. In outbreak B, the flock identified as the source of SE infected eggs had been depopulated by farm management due to aging of the layer hens prior to its identification by the United States Department of Agriculture (USDA); therefore, this layer flock was not cultured.

Comment

These outbreaks highlight several critical issues in the epidemiology and prevention of morbidity from *Salmonella*.

Common food handling errors identified in egg-associated SE outbreaks include use of raw shell eggs in recipes, pooling many eggs together prior to cooking, holding eggs or egg-containing foods at temperatures that allow multiplication of organisms, and inadequate duration or intensity of cooking so that temperatures sufficient to kill SE are not reached.⁵ Restaurant A contributed to the outbreak by failing to purchase and store eggs under refrigeration, pooling large numbers of eggs, allowing pooled eggs to sit at incubating temperatures, and cross-contaminating egg pools by mixing new egg pools with prior pools before cooking. Restaurant B served a product containing pooled raw egg yolks and allowed that product to sit at incubating temperatures for prolonged periods of time.

Outbreaks A and B also demonstrate the high attack rates among employees (27% and 39%, respectively) during *Salmonella* outbreaks and the relative frequency with which employees who report no symptoms are found to harbor SE during the course of an outbreak (17% and 10%, respectively). This finding underscores the importance of screening all potential foodhandlers in the setting of an outbreak.

The greater severity of illness seen in patrons may be attributable to reporting bias. Patrons with mild or asymptomatic infection are less likely to be reported during an outbreak investigation. Patrons with mild symptoms may not report illness to their local health department, may not pursue medical evaluation, or may not associate their illness with food or drink consumed several meals prior to the onset of symptoms.

Both outbreaks A and B revealed that the food item implicated as causing patron illness was not substantially associated with risk of illness among employees.

The risk of using even small quantities of raw shell eggs in non-food service settings is demonstrated by outbreak C, which was associated with consumption of a single raw egg in a recipe prepared and served in the absence of other food handling errors. The high attack

rate and severity of illness should serve as caution to anyone contemplating preparation of a raw egg-containing food (e.g., homemade eggnog, homemade mayonnaise, mousses, uncooked cake or cookie batter, merengue, some cake icings).

Outbreaks A and D were associated with partially cooked eggs. Recipes which call for partially cooked eggs (e.g., lightly cooked custards, hollandaise or bear-naise sauce, eggs "over easy") should be considered risky because partial cooking may not be sufficient to destroy all the organisms in an infected egg.⁴⁻⁶

Another food item that has been frequently implicated in SE outbreaks in the United States is crabcakes or other fried seafood cakes. The recipes for these foods include raw eggs. Since such cakes contain previously cooked crab meat or other seafood, they should be brought to 165°F. However, frying is often stopped when the outside reaches the desired brownness. The center of the crabcake or fish cake is insulated from the fryer's heat and, thus, is frequently inadequately cooked.

The USDA instituted regulations in 1990 permitting investigation of flocks which have been epidemiologically implicated in SE outbreaks. Flocks which are found to be infected with SE are restricted from sale of fresh eggs; the flocks are either destroyed or their eggs are diverted to pasteurization. To facilitate tracing of eggs in SE outbreaks, each case of eggs purchased by a retailer or food service establishment is accompanied by a packing slip identifying the flock which produced the eggs. To facilitate egg tracing, Maryland regulations require purchasers to retain these packing slips in their records for 90 days. In each of the outbreaks reported above, the responsible restaurateur or retailer had not maintained such records. This failure delayed and complicated egg tracing efforts. However, using shipping invoices, each of the layer flocks responsible for generating the implicated eggs was eventually identified.

Recommendations

Physicians can be a primary source of counseling on safe food-handling for their patients. They also have access to the populations most susceptible to severe illness resulting from SE gastroenteritis: infants, adults over age 65, and immunocompromised patients.

The following recommendations are proposed to consumers in the light of these and other egg-associated SE outbreaks:⁷

1. Consuming raw or partially cooked eggs or egg-containing foods is strongly discouraged and particularly ill-advised in the aforementioned high-risk groups. Pasteurized eggs are a safe alternative to shell eggs. No outbreaks of SE have been associated with pasteurized eggs.
2. Thorough cooking kills *Salmonella* and is achieved only when yolks or pools are no longer liquid or moist. Serve cooked eggs and egg-containing recipes

immediately after preparation or refrigerate promptly. Discard egg leftovers if not consumed within three days, even if they have been refrigerated.

3. Pooling of eggs is strongly discouraged. If recipes call for pooled eggs, pasteurized eggs are recommended. When shell eggs are pooled, pools should be as small as possible and the eggs used should be $\leq 45^{\circ}\text{F}$ just prior to pooling and must be maintained at that temperature after pooling until cooked.
4. When refrigerating a large amount of an egg containing food, divide it into several shallow containers so that it will cool quickly.
5. Use grade A or AA eggs. Eggs should be purchased only if refrigerated and then should be maintained at $\leq 45^{\circ}\text{F}$ during storage. Eggs, cooked or uncooked, should be discarded if they have been out of refrigeration for more than two hours.
6. Exercise caution when selecting food items from restaurant menus--when in doubt, ask if the food contains raw or under cooked eggs.

All physicians and laboratories are required to report evidence of *Salmonella* infection to their local health department within 48 hours of diagnosis or isolation.⁸ Confirmed and suspected outbreaks are immediately reportable. Rapid reporting facilitates health department investigation.

TOUGH, SMART AND YOURS

medical
economics

Successfully defending a brain-damaged baby case is the courtroom equivalent of pitching a no-hitter. Because the "sympathy factor" can add millions to a jury's award, many insurance carriers would rather settle than fight.

Not so the P-I-E Mutual Insurance Co. of Cleveland, Ohio, and the 1-year-old law firm—Maynard, Tuschman & Kalur—that does all its defense work. In 21 brain-damaged baby cases it has defended for the doctor-owned company, its record is remarkable. 10-1-1, the last a hung jury. In 1988, its overall record read 33 wins, 3 losses—all malpractice cases.

There's more to these numbers than luck "It's even legal skill," adds JMT&K founding partner Aaron Jacobson, who was one of Ohio's leading plaintiffs' lawyers before he, Larry E. Rogers, Herbert S. Bell, M.D., and 70 other Cleveland doctors formed P-I-E in 1975.

"It's the concept behind the firm that makes it work. Physicians specialty panels review every lawsuit to decide whether the defendant deviated significantly from the standard of care. If he did, we pay. If he didn't, we defend. Makes no difference whether it's a \$5,000 or a \$5-million case. We label it 'No pay.' That policy has resulted in a lot of cases being dropped. Perhaps more important, it's

DON'T YOU WISH THESE DEFENSE LAWYERS WERE YOURS?

This big, multistate firm rarely loses a case. But it's more than luck, or even legal skill, that's behind its enviable record.

By Howard Eisenberg

discouraged the filing of many other cases. Plaintiffs' attorneys have learned that we're fair negotiators when our doctor's in the wrong, but won't back down when he's right."

That approach pays off. "According to the most recent report I've seen from the General Accounting Office," says Larry Rogers, P-I-E president and CEO, "in 1984, about 37 percent of medical-malpractice claims were closed without payment."

Through 1988, we've closed an average of 78 percent of our cases without a dime changing hands. And it's my understanding that, without including defense costs, St. Paul Fire and Marine Insurance Co.'s 1988 average gross payout for cases closed in Ohio with payment was \$32,500. Our comparable figure was about \$10,000 below

theirs. That's partly why we can sell an OHG specialist in Ohio—an industrial state that ranks among the most litigious—\$12 million in coverage for just \$20,000."

The unique marriage of P-I-E and JMT&K has been so successful that the carrier has expanded into five other states: Indiana, Kentucky, Maryland, Missouri, and West Virginia. Where P-I-E goes, there goes JMT&K, with one branch of medical-malpractice defense attorneys exclusively to medical-malpractice defense.

Could the insurer-defender symbiosis, if duplicated by other doctor companies, make a significant contribution to reducing malpractice litigation nationwide? An up-close look at

how JMT&K operates may help to answer that question.

Every lawyer develops a medical specialty

"Our firm's lawyers read more medical books than law books," says P-I-E Vice President Gerard C. Uppenorth, himself a veteran defense attorney. Robert Maynard explains: "New cases are discussed at our weekly staff meeting, so that every lawyer is familiar with every case. But we assign cases to our attorneys according to medical specialty. They're well-versed in their fields, so they don't have to re-invent the wheel with each case."

Last year, the firm's OHG specialist, attorney Jerome S. Kalur, who had won 16 consecutive brain-damaged baby cases, faced one of his toughest challenges when he defended a girl

who'd attempted a malpractice delivery that ended in a Caesarian section and a severely brain-injured baby. Recalls Kalur: "I didn't think the doctor had caused the damage, but our position was weakened by the fact that he didn't have malpractice privileges. Based on that departure from the standard of care, our doctor panel voted to settle, and, since the hospital was also involved, a combined sum of \$1.5 million was offered. Plaintiff turned us down flat."

"I wanted to depose the doctor, who'd been involved in the mother's care during her hospitalization, but the attorney for the plaintiff baby insisted it would violate the mother's physician-patient confidentiality. That privilege would terminate automatically when her medical

The winning firm's four founders at Cleveland's 8th District Court of Appeals (from left): Jerome S. Kalur, Aaron Jacobson, James M. Tuschman, and Robert Maynard.

records were introduced at the trial end of the plaintiff's case. Meanwhile, I was in the moon position of having to tell the jury: 'It couldn't have been the malpractice,' without offering them another reasonable brain-damage theory."

Fortunately, the plaintiffs rested their case on a Friday afternoon, giving JMT&K time for a weekend rally. "Twenty minutes later," says Kalur, "I was in the hospital pathologist's office with an order permitting me to view the mother's placental slides." Meconium staining had been charted, and Kalur had a hunch that fetal distress had begun long before the bir

They're seasoned attorneys with an incredible record of success.

Malpractice specialists in every medical specialty.

More than seventy lawyers in eleven offices: they're part of The P-I-E Mutual team... Jacobson, Maynard, Tuschman & Kalur, a formidable defensive lineup, with an imposing record.

Three-quarters of all claims closed without a penny changing hands.

Ninety percent of the cases that go to trial won.

One of every four doctors will someday face a lawsuit. The P-I-E Mutual helps you face that future without fear. With a claims review committee made up of your peers. And a pre-paid law firm that can rally its total resources against any and all claims.

Soon, your practice could be run from here.

Most people agree that the U.S. health care system needs significant change. And if a single-payor, national system is adopted, it will change.

Some proposals under consideration would put the government in charge of America's health care. That kind of radical change could affect your freedom to make decisions in administering patient care. It could affect the way you're compensated. And how you use medical technology.

If you find these kinds of changes hard to swallow, maybe you should support a proposal that will build on what's good about America's health care system. And change what's not. A plan like Health Access America.

Developed by the American Medical Association, Health Access America was designed to preserve the integrity of the system while improving programs like Medicare and Medicaid, and requiring employer-sponsored health plans.

So while there's still time, speak for yourself. Join the AMA's call for reform. Call 1-800-AMA-3211 for more information on Health Access America.

Health Access America

The AMA proposal to improve access to affordable, quality health care.

American Medical Association

Physicians dedicated to the health of America

Jane Avery Fiscus, M.D. recently received the Western Maryland Area Health Education Center (AHEC) Annual Award for Distinguished Service to Health Care in Western Maryland. V. Raul Felipa, M.D., Chairperson of the Western Maryland AHEC Medical Caucus, presented the award to Dr. Fiscus "in recognition of her insightful, resourceful, and dedicated leadership and support of interdisciplinary health professional education in western Maryland." She also received a certificate of faculty appointment as associate professor of clinical medicine at the University of Maryland for her work as a preceptor for medical students and residents in AHEC's Clinical Education Program.

As health officer for the Allegany County Health Department since 1978, she has been responsible for many programs including an adult addiction rehabilitation center; an adolescent residential shelter and treatment unit; and an AIDS prevention, testing, and education program. She began her professional career as a clinical consultant with the Montgomery County Health Department working in the children's clinic, the school health program, the tuberculosis clinic, and the venereal disease clinic. In 1967, she was appointed director of Child Mental Health Services. Dr. Fiscus has also worked as a private family practitioner in West Virginia, and as a geriatric consultant and medical director for the Lions Manor Nursing Home.

A graduate of Oklahoma State University and Baylor University College of Medicine, where she also completed graduate studies in biochemistry, Dr. Fiscus did residency work in internal medicine at Duke University and was awarded a postdoctoral fellowship at Baylor.

Robert M. Heyssel, M.D., president of the Johns Hopkins Hospital and the Johns Hopkins Health System, was honored by the German Society of Maryland with its 1991 award for service to the German community of Maryland. Proceeds from the ceremony on November 8, which was attended by

Ambassador Jurgen Ruhfus of the Federal Republic of Germany, will go to the society's scholarship fund.

A graduate of the University of Missouri School of Medicine and St. Louis University, Dr. Heyssel has received numerous academic awards and distinctions including the U.S. Public Health Service Career Development Award, a Distinguished Alumnus Award from the University of Missouri, and Sc.D. honors from St. Louis University. Dr. Heyssel began his teaching career in 1959 as an instructor at the Vanderbilt University School of Medicine in Nashville, Tennessee. Since that time, he has published a myriad of articles on hematology, the role of medical schools, and the health care marketplace. His credentials include an impressive list of public service activities, and memberships in many professional and learned societies. Dr. Heyssel is married and has five children.

Carol Johnson Johns, M.D., associate professor of medicine and assistant dean and director of continuing education at the Johns Hopkins University School of Medicine, was recently awarded the American Lung Association of Maryland's (ALAM) George Wills Comstock, M.D. Award. She received this award in recognition of her extraordinary lifetime service to the ALAM's

goals of promoting respiratory health through care, teaching, and research.

Dr. Johns is a graduate of Wellesley College (honors chemistry) and the Johns Hopkins University School of Medicine. In 1974, she was cited as Medical Woman of the Year by the Medical College of Pennsylvania. A prolific author, Dr. Johns has been associated with Johns Hopkins since 1953. She is married to Richard J. Johns, M.D., and has three children.

John O. Meyerhoff, M.D., an assistant professor of medicine for the Division of Rheumatology and Clinical Immunology at the University of Maryland School of Medicine, was recently awarded the 1991 Community Service Award by the Baltimore City Medical Society (BCMS) for his special contributions to Parents Anonymous of Maryland. Having served as chairperson of its board of directors since 1986, Dr. Meyerhoff has led the agency's drive to strengthen families and prevent child abuse and neglect throughout Maryland. He helped develop educational programs that successfully increased public awareness and understanding of child abuse and its negative effect on society. His determination to prevent adolescents from dropping out of school, becoming pregnant, or turning to drugs or crime, resulted in the formation of many innovative programs, the most recent of which enables young, troubled teens to receive needed services at 20 city and county schools. In addition, Dr. Meyerhoff singlehandedly raised much needed funds, allowing the agency to increase its professional staff from two to 15, and the board of directors to 25.

A native of Baltimore, Dr. Meyerhoff received his bachelor's degree from the University of Michigan and his medical degree from the University of Pennsylvania. He served his internship and residency in internal medicine at Latter Day Saints Hospital in Salt Lake City, Utah. In 1981, he returned to Baltimore where he completed a rheumatology fellowship at the Johns Hopkins University School of Medicine. An assistant professor of medicine at Hopkins, he is a fellow of the Maryland Chapter of the Arthritis Foundation; a fellow of the American College of Physicians; and a diplomate of the American Board of Internal Medicine. In addition to his work with Parents Anonymous, Dr. Meyerhoff

has served in a variety of positions for the Medical and Chirurgical Faculty of Maryland, the Maryland Chapter of the Arthritis Foundation, the Maryland Society for the Rheumatic Diseases, and the Maryland Lupus Foundation. He is a reviewer for four medical journals and has published extensively in the field.

Roland T. Smoot, M.D., who resides with his wife Minnie in the Baltimore area, received the Maryland Society of Internal Medicine's (MSIM) 1991 Internist of the Year Award in November 1991. MSIM, which locally represents more than 650 internists, was founded in 1956 to promote the optimal delivery of cost-effective, high-quality medical care.

Dr. Smoot received his medical degree from the Howard University School of Medicine. He served his internship and his residency at K.B. Reynolds Memorial Hospital in North Carolina and the Veterans Administration Hospital in Alabama, respectively. Certified by the American Board of Internal Medicine in 1963, Dr. Smoot became a fellow of the American College of Chest Physicians in 1965, and a fellow of the American College of Physicians in 1970.

Currently dean of Student Affairs at the Johns Hopkins University School of Medicine, Dr. Smoot is also an assistant professor of medicine at that institution. Dr. Smoot is presently on the hospital medical staff at Johns Hopkins Hospital, Liberty Medical Center, and St. Agnes Hospital.

An active Med Chi member and member of the Baltimore City Medical Society (BCMS), Dr. Smoot has served as a member of Med Chi's executive committee, the BCMS board of directors, and, ultimately, became president of both organizations. Dr. Smoot also has served as president of the Maryland Thoracic Society and the Baltimore City Medical Society Foundation. He is currently a delegate to the American Medical Association and a member of the board of directors of its American Political Action Committee. In addition, Dr. Smoot has served on a number of community and civic associations including the boards of directors of the Maryland Blue Shield, Inc., the Health and Welfare Council of the State of Maryland, the Maryland Consortium for High Blood Pressure Control, and the Governor's Task Force to Study Arthritis. He is a charter member of the Lois Thomas Minority Leadership and Scholarship Guild at the University of Maryland at Baltimore.

Dr. Smoot has also been the recipient of the A.H. Robins Award for Community Service presented annually by Med Chi, the Equal Opportunity Award given by the Baltimore Urban League, Inc., and the 1989 Martin Luther King, Jr. Humanitarian Award given by the Coalition of Minority

Professional Students at the University of Maryland at Baltimore.

The Maryland medical community is very familiar with Dr. Smoot's long-standing commitment to internal medicine and the care of its patients. J. Leonard Lichtenfeld, M.D., president of MSIM notes, "As a respected member of our community, Dr. Smoot represents the best of internal medicine."

Wayne C. Spiggle, M.D. received the Maryland Society of Internal Medicine's (MSIM) 1991 Special Recognition Award in November 1991.

Dr. Spiggle received his degree in medicine from the West Virginia University and the Medical College of Virginia. Dr. Spiggle served his internship at the Charleston Memorial Hospital and completed his residency at the West Virginia Medical Center. Dr. Spiggle helped establish the Braddock Medical Group in Cumberland — the first group practice of internal medicine in Maryland.

Dr. Spiggle has been very active both in community and medical affairs in Cumberland, as well as throughout Maryland. He has served as a member of the Cumberland Area Chamber of Commerce, as president of Citizens for Responsible Waste Disposal, as chairperson of the Board of Visitors of the Appalachian Environmental Laboratory, and as a member of the Chancellor's Advisory Committee.

Dr. Spiggle has been affiliated with the Sacred Heart Hospital in Cumberland where he has served as chairperson of the Department of Medicine and as president of the Medical Staff. He is a clinical assistant professor of medicine at the University of Maryland School of Medicine, and a visiting clinician at West Virginia University School of Medicine.

On behalf of the Allegany County Medical Society

(ACMS), Dr. Spiggle assisted in founding ACCESS, a program established 15 years ago to facilitate entry of Medicaid patients into the medical care system. More recently, Dr. Spiggle founded Allegany Health Right, an award-winning program in which ACMS cooperates with the entire community to provide health care to "gray area" patients who do not qualify for government aid but who cannot afford health insurance. The program uses private physician offices and private doctor-patient relationships as a working model.

Dr. Spiggle was also selected as a recipient of the A.H. Robins Award for Community Service presented by Med Chi, and the 1991 Community Service Award from the West Virginia Chapter of Common Cause.

Dr. Spiggle and his wife Betty reside on and manage a small farm in Short Gap, West Virginia. ■

AMA'S PHYSICIAN'S RECOGNITION AWARD PHYSICIAN'S RECOGNITION AW

PHYSICIAN'S RECOGNITION AWARD

During November and December of 1991, the physicians listed below received the American Medical Association's (AMA's) Physician's Recognition Award. Established in 1968, the Award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital /Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.

The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families.

The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (301)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (301)727-1020.

HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. If you wish to help further the work of the Committee through a tax deductible donation send your check to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1204 Maryland Avenue, Baltimore, Maryland 21201 Please note on your donation: "Physician Rehab"

When you can buy
any home, here's
why you'll choose
a Villager.

1. Villager offers the finest homesite locations—in Green Spring Valley communities as well as Worthington Park and the Falls Road corridor. We'll also build your home on your lot... with our plans or yours. Below market financing.

2. Breathtaking estate-size home designs, and the reputation for using the very finest materials and craftsmen.

3. The opportunity to work one on one with our designers. We'll custom build from your designs or from ours. Our new 1991 designs include the Euro Classic I Award of Excellence recipient from the Homebuilders Association of Maryland and the next generation of our Euro Classic series. Call now. We're building just a few homes for 1991, from \$290,000 to over \$1 million. Phone Sandy Marenberg or Karen Pine for a personal consultation.

Leave room in your facilities plan for a program that fills beds and saves lives: Early Cardiac Care.

Designate a center at your hospital where adults can check out early warning symptoms of heart attack. You can get more cardiac patients into your hospital at a time when your medical staff can do the most to help them. An Early Cardiac Care Center, combined with effective cardiac outreach programs to increase awareness of cardiac symptoms, will increase Cardiac Care Unit admissions—

and increase the percentage of patients treated in earlier stages of heart attack.

Get to the heart of the heart attack problem in your community. For more information on how to establish an Early Cardiac Care Center, contact: Raymond D. Bahr, M.D., FACP

St Agnes Hospital

NEW INDICATION

ONLY ONE H₂-ANTAGONIST HEALS REFLUX ESOPHAGITIS AT DUODENAL ULCER DOSAGE. ONLY ONE.

Of all the H₂-receptor antagonists, only Axid heals and relieves reflux esophagitis at its standard duodenal ulcer dosage. Axid, **150 mg b.i.d.**, relieves heartburn in **86%** of patients after one day and **93%** after one week.¹

AXID[®]
nizatidine
150 mg b.i.d.

ACID TESTED. PATIENT PROVEN.

AXID[®]

nizatidine capsules

Brief Summary. Consult the package insert for complete prescribing information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to 8 weeks of treatment at a dosage of 300 mg h.s. or 150 mg b.i.d. Most patients heal within 4 weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a dosage of 150 mg h.s. at bedtime. The consequences of therapy with Axid for longer than 1 year are not known.

3. *Gastroesophageal reflux disease (GERD)*—for up to 12 weeks of treatment of endoscopically diagnosed esophagitis, including erosive and ulcerative esophagitis, and associated heartburn at a dosage of 150 mg b.i.d.

Contraindication: Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H₂-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H₂-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix[®] may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chloridazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Worldwide, controlled clinical trials included over 6,000 patients given nizatidine in studies of varying durations. Placebo-controlled trials in the United States and Canada included over 2,600 patients given nizatidine and over 1,700 given placebo. Among the adverse events in these placebo-controlled trials, only anemia (0.2% vs 0%) and urticaria (0.5% vs 0.1%) were significantly more common in the nizatidine group. Of the adverse events that occurred at a frequency of 1% or more, there was no statistically significant difference between Axid and placebo in the incidence of any of these events (see package insert for complete information).

A variety of less common events were also reported; it was not possible to determine whether these were caused by nizatidine.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of anti-androgenic activity due to nizatidine. Impotence and decreased libido were reported with similar frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Anemia was reported significantly more frequently in nizatidine than in placebo-treated patients. Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H₂-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Urticaria was reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H₂-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. The ability of hemodialysis to remove nizatidine from the body has not been conclusively demonstrated; however, due to its large volume of distribution, nizatidine is not expected to be efficiently removed from the body by this method. PV 2093 AMP [101591]

Additional information available to the profession on request.

INFORMATION FOR AUTHORS INFO

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201-5585. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references), with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately twenty-five to fifty words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to twenty in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permission: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Page proofs will be mailed to the principal or corresponding author and, if not returned by the specified date, will be considered approved as typeset.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation

A live program

Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.

Broadcast across the country

An hour-long program

Call-in format: Physician answers questions from listeners

Sunday Morning Consultation

A pre-taped program

Sunday at 7:30 a.m.

Broadcast on WBAL - AM radio

A half-hour program

Interview format: one-on-one talk with John Stupak

For more information, contact Lori Robinson at 539-0872 (Baltimore area) or at 1-800-492-1056 (toll-free from elsewhere in Maryland).

DIFFICULT DECISIONS

An Older Person Exhibits The
Following Psychopathology:

1. Depression, Bizarre Behavior, Schizophrenia
2. Severe Anxiety, Mania, Functional or Organic Psychoses
3. Impulsivity, Eating Disorders, Severe Obsessions/Compulsions
4. Addictions in Conjunction with Other Psychiatric Disorders

What Is An Effective Therapeutic Response?

The
Geropsychiatric
Program
At
Taylor
Manor
Hospital

In response to the growing population of older persons who suffer from a treatable mental illness, Taylor Manor Hospital announces the expansion of our Geropsychiatric Program. Now, older patients who may have reversible dementia, affective disorder, depressive illness and addictions accompanied by psychiatric symptoms, will benefit from the comprehensive assessment and treatment provided by our multi-disciplinary team of geriatric specialists.

Admission criteria to the Geropsychiatric Program are as follows: patients must be age 65 or older (unless suffering from premature pathological aging), must exhibit moderate to severe emotional, behavioral, intellectual, or neurological impairment, or pose a danger to themselves and/or others. Length of stay depends upon the nature of the illness and responsiveness to treatment.

Each patient receives highly individualized attention through individual and group therapy, as well as educational groups and an array of multi-modal programs addressing specific problems. The referring professional is closely consulted at every stage of therapy -- including the initial consultation and our in-depth diagnostic evaluation -- to ensure that the individual is placed in the most appropriate treatment setting. Taylor Manor Hospital also provides specialized medical attention, if needed, through agreements with local hospitals, following consultation with the referral source.

Aftercare treatment is coordinated by a staff social worker, in close cooperation with the referring professional. Because of the importance we place on effective continuity of care, our affiliated network of conveniently located outpatient treatment centers (Taylor Mental Health Services), is available to patients after discharge at the discretion of the referring professional. Our common goal is to restore seniors to their maximum emotional well-being, by providing personal support and practical help in an atmosphere of consideration, respect, and caring.

for Maryland Physicians

It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

Because Life Should Be Worth Living.

It used to be that when patients with a serious or demanding illness were sent home from the hospital, in effect, they were being sent home to die. Today, we are sending them home to live.

Caremark is assisting these people—children, young mothers and fathers, working people in the prime of their lives, as well as the elderly—to keep the rhythm of their lives intact by providing them home infusion services with more clinical expertise and personal commitment than any other company.

A commitment to clinical treatment that enhances the quality of your patient's life. An easy referral process. Complete, autonomous service centers. Timely clinical feedback for you and psychosocial support for your patient.

And we're more than a company. Caremark is people who thrive on giving others hope, dignity, respect and an extended family for support.

With unwavering conviction, we value the principle that, regardless of disease state or condition, life should be worth living.

At MetPath, the reason we set the highest standards for ourselves is simple:

Our Clients Put Us To The Test Everyday.

When you're put to the test millions of times a year, you have to be the best. Our skilled laboratory professionals use the latest technology, instrumentation and methodologies to provide the most accurate results. And we constantly strive to improve our service through continuing employee education and stringent quality assurance programs. In fact, our broad experience and attention to detail has helped us earn an exceptional proficiency rating — just what clients expect

when accuracy is critical. And while technology and quality assurance programs are important in our business, the most essential element at MetPath is our people. Each employee is committed to providing the very best service. As our client, you can rely on our employees to meet the constantly changing needs of your practice. For accuracy, experience, dedication, and the highest standards in the industry, MetPath comes through time and again.

Put us to the test and see for yourself.

VOLUME 41 NO 3

^{99m}Tc dimercaptosuccinic acid scan in evaluating patients with urinary tract infection215

Fred Heldrich, M.D.

In clinical practice, determining which patients with urinary tract infection have upper tract involvement is difficult yet important for proper management. This report indicates that the ^{99m}Tc dimercaptosuccinic acid (DMSA) scan is a useful test in making this determination.

Complications of operative and endoscopic gastrostomies219

Jeanette Linder, M.D. and E. George Elias, M.D., Ph.D.

In a retrospective study of fifty cases of gastrostomy insertion performed operatively (OG) or using a percutaneous endoscopic approach (PEG), complication rates were 74 percent (nineteen adults) and 76 percent (seventeen children) in the OG group, and 86 percent (fourteen adults) in the PEG group. While most complications were minor, major ones were usually related to the underlying disease and the general condition of the patient.

Strategies to reduce the high cost of patient noncompliance223

Diane L. McNally, B.S.Pharm and Debra Wertheimer, M.D.

The documented low rate of compliance can result from ineffective communication by the pharmaceutical and medical profession, and poor comprehension of prescription instructions by the public. Presented are several examples of how pharmacists can assist physicians in improving and monitoring their patients' compliance behavior. Strategies to enhance communication through the written prescription are offered.

Community hospital implementation of intraaortic balloon pump therapy for complicated myocardial infarction227

Daniel I. Woronow, M.D., F.A.C.C.

The intraaortic balloon pump may be employed in the community hospital setting to stabilize complicated acute myocardial infarction, even in the presence of thrombolytic therapy.

Hypertriglyceridemia: Severe Type V hyperlipidemia in a young woman231

Rudolf Titanji, M.D. and Aldo Paz-Guevara, M.D.

We present a patient with the typical clinical and biochemical features of severe Type V hyperlipidemia associated with alcohol consumption and estrogen use. Prompt medical intervention resulted in normalization of her lipid profile. We review the lipoprotein composition, the role of lipoproteins in lipid transport with special emphasis on triglycerides, and the clinical features, pathogenesis, and management of Type V hyperlipidemia.

Editorial Calendar

Upcoming issues of the Maryland Medical Journal will include a focus on physician rehabilitation; a biographical sketch of Jose M. Yosucio, M.D., Med Chi's president-elect, including his plans for the 1992-1993 year; highlights of the career of Richard S. Ross, M.D., dean emeritus of the Johns Hopkins University School of Medicine; the introduction of a new column—Clinicopathology Conferences at Johns Hopkins; and a tribute to John Dennis, M.D., dean emeritus, University of Maryland Medical School.

The MMJ editorial board urges authors to submit original research, case studies, and review articles. We also welcome commentaries and letters to the editor.

Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

Maryland General-Bryn Mawr Rehab Center.
We're the new team in town with lots of experience.

 **MARYLAND GENERAL
BRYN MAWR REHAB CENTER**

827 Linden Avenue, Baltimore, Maryland 21201 (301) 225-8380

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

Howard/Carroll County: 964-6808/Montgomery County: 840-6300
Prince Georges County: 952-5600/Washington County: 790-6800

The recommended starting dose of Calan SR is 180 mg once daily. Dose titration will be required in some patients to achieve blood pressure control.

A lower initial starting dosage of 120 mg/day may be warranted in some patients (eg, the elderly, patients of small stature).

Constipation, which is easily managed in most patients, is the most commonly reported side effect of Calan SR.

BRIEF SUMMARY

Contraindications: Severe LV dysfunction (see *Warnings*), hypotension (systolic pressure < 90 mm Hg) or cardiogenic shock, sick sinus syndrome (if no pacemaker is present), 2nd- or 3rd-degree AV block (if no pacemaker is present), atrial flutter/fibrillation with an accessory bypass tract (eg, WPW or LGL syndromes), hypersensitivity to verapamil.

Warnings: Verapamil should be avoided in patients with severe LV dysfunction (eg, ejection fraction < 30%) or moderate to severe symptoms of cardiac failure and in patients with any degree of ventricular dysfunction if they are receiving a beta-blocker. Control milder heart failure with optimum digitalization and/or diuretics before Calan SR is used. Verapamil may occasionally produce hypotension. Elevations of liver enzymes have been reported. Several cases have been demonstrated to be produced by verapamil. Periodic monitoring of liver function in patients on verapamil is prudent. Some patients with paroxysmal and/or chronic atrial flutter/fibrillation and an accessory AV pathway (eg, WPW or LGL syndromes) have developed an increased antegrade conduction across the accessory pathway bypassing the AV node, producing a very rapid ventricular response or ventricular fibrillation after receiving I.V. verapamil (or digitalis). Because of this risk, oral verapamil is contraindicated in such patients. AV block may occur (2nd- and 3rd-degree, 0.8%). Development of marked 1st-degree block or progression to 2nd- or 3rd-degree block requires reduction in dosage or, rarely, discontinuation and institution of appropriate therapy. Sinus bradycardia, 2nd-degree AV block, sinus arrest, pulmonary edema and/or severe hypotension were seen in some critically ill patients with hypertrophic cardiomyopathy who were treated with verapamil.

Precautions: Verapamil should be given cautiously to patients with impaired hepatic function (in severe dysfunction use about 30% of the normal dose) or impaired renal function, and patients should be monitored for abnormal prolongation of the PR interval or other signs of overdosage. Verapamil may decrease neuromuscular transmission in patients with Duchenne's muscular dystrophy and may prolong recovery from the neuromuscular blocking agent vecuronium. It may be necessary to decrease verapamil dosage in patients with attenuated neuromuscular transmission. Combined therapy with beta-adrenergic blockers and verapamil may result in additive negative effects on heart rate, atrioventricular conduction and/or cardiac contractility; there have been reports of excessive bradycardia and AV block, including complete heart block. The risks of such combined therapy may outweigh the benefits. The combination should be used only with caution and close monitoring. Decreased metoprolol and propranolol clearance may occur when either drug is administered concomitantly with verapamil. A variable effect has been seen with combined use of atenolol. Chronic verapamil treatment can increase serum digoxin levels by 50% to 75% during the first week of therapy, which can result in digitalis toxicity. In patients with hepatic cirrhosis, verapamil may reduce total body clearance and extrarenal clearance of digoxin. The digoxin dose should be reduced when verapamil is given, and the patient carefully monitored. Verapamil will usually have an additive effect in patients receiving blood-pressure-lowering agents. Disopyramide should not be given within 48 hours before or 24 hours after verapamil administration. Concomitant use of flecainide and verapamil may have additive effects on myocardial contractility, AV conduction, and repolarization. Combined verapamil and quinidine therapy in patients with hypertrophic cardiomyopathy should be avoided, since significant hypotension may result. Concomitant use of lithium and verapamil may result in a lowering of serum lithium levels or increased sensitivity to lithium. Patients receiving both drugs must be monitored carefully. Verapamil may increase carbamazepine concentrations during combined use. Rifampin may reduce verapamil bioavailability. Phenobarbital may increase verapamil clearance. Verapamil may increase serum levels of cyclosporin. Verapamil may inhibit the clearance and increase the plasma levels of theophylline. Concomitant use of inhalation anesthetics and calcium antagonists needs careful titration to avoid excessive cardiovascular depression. Verapamil may potentiate the activity of neuromuscular blocking agents (curare-like and depolarizing); dosage reduction may be required. There was no evidence of a carcinogenic potential of verapamil administered to rats for 2 years. A study in rats did not suggest a tumorigenic potential, and verapamil was not mutagenic in the Ames test. Pregnancy Category C. There are no adequate and well-controlled studies in pregnant women. This drug should be used during pregnancy, labor, and delivery only if clearly needed. Verapamil is excreted in breast milk; therefore, nursing should be discontinued during verapamil use.

Adverse Reactions: Constipation (7.3%), dizziness (3.3%), nausea (2.7%), hypotension (2.5%), headache (2.2%), edema (1.9%), CHF, pulmonary edema (1.8%), fatigue (1.7%), dyspnea (1.4%), bradycardia: HR < 50/min (1.4%), AV block: total 1°; 2°; 3° (1.2%), 2° and 3° (0.8%), rash (1.2%), flushing (0.6%), elevated liver enzymes, reversible non-obstructive paralytic ileus. The following reactions, reported in 1.0% or less of patients, occurred under conditions where a causal relationship is uncertain: angina pectoris, atrioventricular dissociation, chest pain, claudication, myocardial infarction, palpitations, purpura (vasculitis), syncope, diarrhea, dry mouth, gastrointestinal distress, gingival hyperplasia, ecchymosis or bruising, cerebrovascular accident, confusion, equilibrium disorders, insomnia, muscle cramps, paresthesia, psychotic symptoms, shakiness, somnolence, arthralgia and rash, exanthema, hair loss, hyperkeratosis, macules, sweating, urticaria, Stevens-Johnson syndrome, erythema multiforme, blurred vision, gynecostasia, galactorrhea/hyperprolactinemia, increased urination, spotty menstruation, impotence.

Annual Meeting

mini-invasion & MEGATREATMENTS

"Mini-invasion and Megatreatments,"
at the

Omni Inner Harbor Hotel
101 West Fayette Street

Baltimore, Maryland

Thursday – Saturday

April 30, May 1 – 2, 1992

This year's meeting focuses on two
exciting new medical technologies:

mini-invasion – the use of "scopes" in
surgical and non-surgical
diagnosis and treatment;
and...

megatreatments – massive treatments
administered to reverse
negative pathology.

Medical and Chirurgical Faculty of Maryland's 194th Annual Meeting "Mini-invasion and Megatreatments,"
at the Omni Inner Harbor Hotel, Thursday – Saturday April 30, May 1 – 2 1992

MEETING REGISTRATION AND SOCIAL EVENT RESERVATIONS

Meeting Registration

Med Chi Members

☐ No Charge

Mail to: Med Chi Convention Department

1211 Cathedral Street, Baltimore, MD 21201-5585

If using your credit card, you may FAX your registration to 410-547-0915 or phone in your registration to Lori Robinson or Vivian Smith at 1-800-492-1056 or 1-410-539-0872.

For questions about the Omni Inner Harbor Hotel or other events at the annual meeting contact Betsy Newman, Public Relations Director, at 1-800-492-1056 or 1-410-539-0872.

Support Our Exhibitors

Exhibits are an integral part of Med Chi's annual meeting and are a valuable adjunct to the scientific program.

By visiting the exhibits before and after your scientific program, you will help ensure that Med Chi continues to receive valuable income that allows us to offer you annual and semiannual meetings.

Med Chi urges you to express your appreciation to exhibitors by visiting their booths and discussing your mutual involvement in patient care.

Exhibits will be open:

Thursday: 12:00 noon to 5:30 p.m.

Friday: 9:00 a.m. to 5:30 p.m.

Saturday: 9:00 a.m. to 12:00 noon

Exhibitor sweepstakes drawings will occur in the exhibit area on:

Thursday: 2:45 p.m.

Friday: 10:45 a.m.

Saturday: 10:45 a.m.

You must be present to win

Continuing Medical Education Credits

The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

The Medical and Chirurgical Faculty of Maryland designates this continuing medical education activity for 36.5 credit hours in Category 1 of the Physician's Recognition Award of the American Medical Association. Physicians attending this year's meeting can earn up to a maximum of 16.5 CME credits.

For questions about continuing medical education credits or any of the scientific sessions call:

Joan Mannion

Director of Continuing Medical Education,
at 1-800-492-1056 or 410-539-0872.

Meeting Overview*

Thursday, April 30, 1992

8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – Council Meeting

9:30 a.m. – House of Delegates Meeting/General Membership Meeting featuring:

Special Guest Speaker

Ron Shapiro, Esq.

9:30 a.m. – Spouse Program

11:00 a.m. – 4:00 p.m. – Auxiliary 43rd Annual Meeting

11:30 – Scientific Session

12:00 noon – 12:30 p.m. – Break – *Visit the Exhibits* –

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – 2:30 p.m. – Plenary Session

"Health Care Reform"

AMA Trustee Thomas R. Reardon, M.D.

2:30 p.m. – 3:00 p.m. – Break – *Visit the Exhibits* – Exhibitor Sweepstakes Drawing

3:00 p.m. – 6:00 p.m. – Scientific Sessions

4:15 p.m. – Workshop

"Avoiding Excess Retirement and Estate Taxes: Strategies for the 90s"

Med Chi Agency

6:00 p.m. – 9:30 p.m. – Harbor Cruise aboard the *Lady Baltimore* (Reservations required – space is limited)

Friday, May 1, 1992

7:00 a.m. – Prayer Breakfast

8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – 4:00 p.m. – Auxiliary 43rd Annual Meeting

8:30 a.m. – 6:00 p.m. – Scientific Sessions

8:30 a.m. – Workshop

"Accreditation for Continuing Medical Education"

10:30 a.m. – Break – *Visit the Exhibits* –

Exhibitor Sweepstakes Drawing

12:00 noon – Auxiliary Meeting and Auction

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – Mini-Symposium

"Physician Office Labs: Master or Slave?"

4:00 p.m. – Workshop

"Computers in the Medical Office"

7:35 p.m. – Baltimore Orioles vs. Seattle Mariners at the new Oriole Park at Camden Yards (Reservations required – space is limited)

Saturday, May 2, 1992

8:00 a.m. – 12:00 noon – Registration

8:30 a.m. – Mini-Symposium

"Ethics of Dying"

8:30 a.m. – 1:00 p.m. – Scientific Sessions

10:30 a.m. – 11:00 a.m. – Break – *Visit the Exhibits* – Exhibitor Sweepstakes Drawing

11:00 a.m. – Spouse Program

12:30 p.m. – 1:30 p.m. – Lunch on your own

2:00 p.m. – House of Delegates Meeting

3:00 p.m. – Council Meeting

7:00 p.m. – Presidential Banquet

Honoring Med Chi President J. David Nagel, M.D. (Reservations required – black tie optional)

Medical and Chirurgical Faculty of Maryland's 194th Meeting Mini-invasion and Megatreatments

at the Omni Inner Harbor Hotel
101 West Fayette Street, Baltimore, Maryland

Thursday – Saturday, April 30, May 1 – 2, 1992

Preliminary Schedule

THURSDAY, APRIL 30, 1992

8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – Council Meeting

9:30 a.m. – House of Delegates Meeting

Special Guest Speaker

Ron Shapiro, Esq.

9:30 a.m. – Spouse Program

"Personal Safety and Self-Defense for the 90s"

presented by Citizens Against Crime

11:00 a.m. – 4:00 p.m. Auxiliary 43rd Annual Meeting

11:30 a.m. – *"Current Guidelines for the Diagnosis and Treatment of Bronchial Asthma"*

Maryland Asthma and Allergy Society

CME Credits: 1

12:00 noon – 12:30 p.m. – Break – Visit the Exhibits

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – 2:30 p.m. – Plenary Session

"Health Care Reform"

AMA Trustee Thomas R. Reardon, M.D.

2:30 p.m. – 3:00 p.m. – Break – Visit the Exhibits

Exhibitor Sweepstakes Drawing

3:00 p.m. – Scientific Sessions

"Primary Care Follow-up of the Cancer Patient"

Maryland Academy of Family Physicians

CME Credits: 1.5

"Efficacy vs Expense: Maximizing Drug Therapy Outcomes in Your Patient"

Med Chi Committee on Therapeutic Education

CME Credits: 2

"A Fifteen-Year Overview of Focused Remedial Education: A Look at its Present and Future"

Med Chi Committee on Focused Professional Education

CME Credits: 1

4:30 p.m. – Scientific Sessions

Topic To Be Announced

The John Staige Davis Society of Plastic Surgeons of Maryland

CME Credits: TBA

"Endoscopy in Gynecology"

Infertility Associates

CME Credits: TBA

4:15 pm – Workshop

"Avoiding Excess Retirement and Estate Taxes: Strategies for the 90s"

Med Chi Agency

CME Credits: None

6:00 p.m. – 9:30 p.m. – Harbor Cruise aboard the *Lady Baltimore*

featuring dinner buffet & dancing

(Reservations required - space is limited)

FRIDAY, MAY 1, 1992

7:00 a.m. – Prayer Breakfast

"The Physician's Responsibility to Notify the Patient: Duty and Morality"

Med Chi Committee on Medicine and Religion

CME Credits: 1

8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – 4:00 p.m. – Auxiliary 43rd Annual Meeting

8:30 a.m. – Scientific Sessions

"Claims Abstracts: Learning From Experience"

Medical Mutual Liability Insurance Society of Maryland

CME Credits: 2

Fee of \$40.00 required for this course. Register at door.

"Therapeutic Gastrointestinal Endoscopy"

Maryland Society of Gastrointestinal Endoscopy

CME Credits: 2

"Innovative Strategies for Risk Management"

American Heart Association – Maryland Chapter

CME Credits: 2

8:30 a.m. – Workshop

"Accreditation for Continuing Medical Education"

Med Chi Continuing Medical Education Review Committee

(invitational workshop for CME directors/staff)

CME Credits: None

10:30 a.m. – 11:00 a.m. – Break – Visit the Exhibits – Exhibitor Sweepstakes Drawing

11:00 a.m. – Scientific Sessions

"Megatrends in Dermatology"

Maryland Dermatological Society, Inc.

CME Credits: 1.5

"How to Help Your Patients Quit Drinking"

Med Chi Committee on Alcoholism and
Chemical Dependency

CME Credits: 1

"Children and Youths as Performing Artists: Protection of Hearing and Vision"

Med Chi Committee on Medicine and the Performing Arts

CME Credits: 1

"The Battered Women Syndrome – The Hidden Trauma"

Maryland Psychiatric Society Women's Committee in co-
operation with the Med Chi Women in Medicine Committee

CME Credits: 2

12:00 noon – Auxiliary Meeting and Auction

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – Mini-Symposium

"Physician Office Labs: Master or Slave?"

Med Chi Ad Hoc Committee on Laboratory Regulations

CME Credits: 2

4:00 p.m. – Scientific Sessions

"Caring for the HIV-Positive Patient"

Med Chi Committee on AIDS

CME Credits: 2

"Detection and Office Management of Patients with Eating Disorders"

Governor's Task Force on Eating Disorders

CME Credits: 1

"Physicians and the Media"

Med Chi Public Relations Committee

CME Credits: 1

"Substance Abuse: Physician Attitudes, Beliefs and Practices"

Med Chi Committee on Alcoholism and Chemical
Dependency

CME Credits: 1

4:00 p.m. – Workshop

"Computers in the Medical Office"

Med Chi Committee on Computers in Medicine

CME Credits: None

5:00 p.m. – Scientific Sessions

"Micronutrients and Megavitamins: What's New, What's True"

Med Chi Committee on Mental Health

CME Credits: 1

7:35 p.m. – Baltimore Orioles vs Seattle Mariners –

at the new Oriole Park at Camden Yards

(Reservations required – space is limited)

SATURDAY, MAY 2, 1992

8:00 a.m. – 12:00 noon – Registration

8:30 a.m. – Mini-Symposium

"Ethics of Dying"

Med Chi Committee on Professional Ethics

CME Credits: 2

8:30 a.m. – Scientific Sessions

"Provocative Radiologic Techniques: Discography, Facet Blocks, and Nerve Blocks"

Maryland Society of Physical Medicine and Rehabilitation

CME Credits: 2

"Adjuvant Therapy of Breast Cancer: Prognosis and Perspectives"

Maryland Medical Breast Society

CME Credits: 2

10:30 a.m. – 11:00 a.m. – Break - Visit the Exhibits –

Exhibitor Sweepstakes Drawing

11:00 a.m. – Scientific Sessions

"Stereotactic Core Biopsy of Breast Lesions – An Alternative to Surgical Excision"

Diagnostic Breast Center of Cross Keys

CME Credits: 1

"Medical Management in Home Care"

Med Chi Long-Term Care and Geriatrics Committee in
cooperation with the American Medical Association

CME Credits: 2

11:00 a.m. – Spouse Program

"Stress in the Physician's Family"

12:30 p.m. – 1:30 p.m. – Lunch on your own

2:00 p.m. – House of Delegates Meeting

3:00 p.m. – Council Meeting

7:00 p.m. – Presidential Banquet

Honoring Med Chi President J. David Nagei, M.D.

(Reservations required – black tie optional)

*Note: dates, times, session speakers, and topics in this program are subject to change.

Fun Things To Do

Social Events

Med Chi physicians are invited to participate in a wide variety of social events at this year's meeting. Because space is limited, Med Chi is requiring advance registration for all events. To reserve your space, complete the attached registration form or call Vivian Smith at 410-539-0872 or 1-800-492-1056.

Thursday, April 30

6:00 p.m. – 9:30 p.m. Harbor Cruise aboard the *Lady Baltimore*

Dinner buffet and dancing
(Reservations required – space is limited)

Friday, May 1

7:35 p.m. – Baltimore Orioles vs Seattle Mariners
at the new Oriole Park at Camden Yards
(Reservations required – space is limited)

Saturday, May 2

7:00 p.m. Presidential Banquet
Honoring Med Chi President J. David Nagel, M.D.
(Reservations required – black tie optional)

For Your Family...Activities in Baltimore

While you attend scientific sessions, your family can visit a wide variety of Baltimore attractions and shops including

Baltimore Zoo	396-7102/366-5466
The Baltimore Museum of Art	396-7100
Edgar Allen Poe House	396-7932
Fort McHenry National Monument and Historic Shrine	962-4299
Harborplace and The Gallery	332-1491
Lexington Market	685-6169
Maryland Science Center	685-5225
National Aquarium in Baltimore	576-3810
Shot Tower	837-5424
U.S. Frigate Constellation	537-1979
Walters Art Gallery	547-9000
World Trade Center – Top of the World	837-4515

A more complete listing of family activities and dining opportunities will be available at the annual meeting.

Hotel Reservations

The Omni Inner Harbor Hotel is the largest hotel in Maryland and offers luxurious guest accommodations.

Med Chi has reserved a limited number of rooms at a special group rate of \$105.00 plus tax for single/double rooms with a \$16 plus tax charge for each additional person. Children under age 15 stay free.

To receive this special discounted room rate, you must make your hotel reservations by **March 29, 1992**.

To make a reservation call: 1-800-THE-OMNI (1-800-843-6664)

Guest check-in time is 3:00 p.m. and check-out time is 12:00 noon.

Telephone Messages

During the meeting, messages may be relayed to registrants by calling 1-410-752-1100.

Directions to the Omni Inner Harbor Hotel

101 West Fayette Street

Baltimore, Maryland 752-1100

- 95 South – Through Fort McHenry Tunnel to 395 North (Exit 53). Follow 395 North 1/2 mile to Pratt Street, turn right. Go two blocks and turn left onto Charles Street. Go four blocks and turn left onto Fayette Street. The Omni is one block ahead on the left.
- 83 South – Take (Exit 23) off 695 to get on I-83 South. Go to end of expressway. Turn right at first traffic light, which is Fayette Street. The Omni is seven blocks on the left.
- 95 North – Take exit 53, which is 395 North. Follow 395 1/2 mile to Pratt Street, turn right. Go two blocks to Charles Street and turn left. Go four blocks to Fayette Street and turn left. The Omni is one block ahead on the left.
- BWI Parkway – North (295)- 295 North becomes Russell Street near Baltimore. From Russell Street, turn right onto Pratt Street. Go five blocks and turn left onto Charles Street. Go four blocks and turn left onto Fayette Street. The Omni is one block ahead on the left.
- 70 East – Follow 70 East to 40 East (Edmondson Avenue). Edmondson Avenue becomes Mulberry Street. Follow Mulberry to St. Paul Street and make a right. Go three blocks to Fayette Street and turn right. The Omni is two blocks ahead on the left.
- 40 West – 40 West becomes (Pulaski Highway) Orleans Street in Baltimore. Turn left at St. Paul Street. Go four blocks to Fayette Street and turn right. The Omni is two blocks ahead on left.

Hotel Information

Parking

The following parking locations are within walking distance of the Omni Inner Harbor Hotel. For your convenience, parking lot locations and prices are listed below.

Valet Parking at the Omni Inner Harbor Hotel

Rates:

\$9.00 per 24-hour period
unlimited in/out privileges

Self Park

Alright Parking

Located at the Omni Inner Harbor Hotel - Because this garage is not owned by the hotel, parking spaces cannot be reserved or guaranteed.

Hourly Rates or:

\$7.00 - 2 - 10 hours
\$9.00 - 10 - 24 hours

Down Under Parking

Rates :

\$8.25 - For any parking over 3 hours
\$3.25 - Flat rate on Saturday & Sunday

Arrow Parking

Hourly Rates or:

\$6.00 - In by 9:30, out by 7:30 p.m.

1st Maryland Garage

Hourly Rates or:

1992 Med Chi Annual Meeting

Preliminary Program for 1992 Med Chi Annual Meeting

Preceding this newsletter is the preliminary program for Med Chi's 1992 annual meeting to be held Thursday-Saturday, April 30, May 1-2, 1992 at the Omni Inner Harbor Hotel. Featured speakers at the meeting include AMA Trustee Thomas Reardon, M.D., who will speak on "Health Care Reform" on Thursday, April 30, 1992.

Scientific sessions for this year's meeting will feature a variety of topics including

- Ethics of Dying
- Laboratory Regulations
- Domestic Violence
- Primary Care of Patients with HIV
- Risk Management

Social events for this year's meeting include

- Harbor cruise aboard the Lady Baltimore on Thursday, April 30
- Baseball game at the new Orioles Park at Camden Yards on Friday, May 1
- Presidential banquet honoring Med Chi President J. David Nagel, M.D. on Saturday, May 2

Physicians interested in attending the scientific sessions or the social events are encouraged to complete the registration form on the preliminary program preceding this newsletter. For more information about the meeting, contact Vivian Smith at 410-539-0872 or 1-800-492-1056.

President's Regional Conference— Southern Maryland

Physicians in southern Maryland should note the date and time for the President's Regional Conference for Southern Maryland:

*Thursday, March 12, 1992, at 5:30 p.m.
at the Solomons Island Holiday Inn.*

The program will feature updates on important Med Chi issues and a presentation on the AMA's Health Access America. The meeting will also feature a 1-hour CME session on "How to Detect and Treat Nicotine Addiction.*"

Physicians wishing to attend this conference should call Lori Robinson in Med Chi's Communications Department at 1-800-492-1056 or 410-539-0872.

School Immunizations and Second-Dose Measles Vaccine

The Maryland Department of Health and Mental Hygiene (DHMH) has proposed regulations to require children who enter kindergarten and sixth grade in September 1992 to have proof of having received two doses of measles vaccine and proof of having received one dose of mumps vaccine, or a blood test showing immunity to both diseases. Other requirements for DTP, OPV, and rubella remain the same.

We expect the revised COMAR 10.06.04 to be effective by late April 1992. It is important that physicians note these changes in order to respond to requests for second-dose measles vaccine (preferably as MMR).

You may call the Epidemiology and Disease Control Program at DHMH (410-225-6679) if you have specific questions.

* The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council of Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

The Medical and Chirurgical Faculty designates this continuing medical education activity for 1 credit hour in Category 1 of the Physician's Recognition Award of the American Medical Association.

Vaccine Information Pamphlet

Health care providers who administer certain vaccines are required by the National Childhood Vaccine Injury Act of 1986 to provide information to the patient/parent utilizing the Vaccine Information Pamphlet (VIP), or health care providers may develop their own information materials that meet the requirements of the Act.

Information to be provided to the patient/parent is found in the VIP. These pamphlets will be issued for DTP, OPV, and MMR. By April 1, 1992, the Immunization Division of DHMH will supply all Maryland health care providers with reproducible copies for bulk printing. (Users of vaccine supplied by the DHMH will receive the VIPs in quantities to match vaccine use, as is now done with the Important Information Statements.) If you have any questions, please call the Epidemiology and Disease Control Program at 410-225-6679.

Workers Compensation Claims— CPT Codes

Physicians should note that the new evaluation and management codes that are described in the current (1992) CPT book, shall not be used for workers compensation claims. Until further notice, please continue to use the codes found in all prior CPT editions for these services. For more information, contact Lourenna E. Fisher at the Workers Compensation Commission at 410-333-4700.

New CPT Evaluation and Management Codes for 1992

In an effort to keep you apprised of the latest developments in CPT evaluation and management codes for 1992, Med Chi is providing answers to commonly asked questions following this newsletter. This list was prepared by the Health Care Financing Administration. Watch the Executive Director's Newsletter for additional questions and answers about CPT codes in the coming months.

OSHA Regulations

Physicians interested in the new U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) regulations for infection control in the health care setting, should see the Epidemiology and Disease Control Program newsletter on page 261 of this MMJ for more information.

Committee Selection Cards 1992-1993

Med Chi members interested in serving on a Med Chi committee during the 1992-1993 committee year, should complete the committee selection card following this newsletter. All members should complete this card to be considered for appointment.

Physician Volunteers for the Board of Physician Quality Assurance Needed

Med Chi is seeking practicing licensed Maryland physicians who are interested in serving as members of the Board of Physician Quality Assurance. Med Chi is responsible for submitting a list to the governor of physicians who meet this requirement. Med Chi is soliciting volunteers from component medical societies and is advertising in the news media for non-member volunteers to serve on the board.

Med Chi membership is not required for appointment to the Board of Physician Quality Assurance

If you are interested in serving on the board, please send your curriculum vitae, no later than March 16, 1992, to

*Executive Director
Med Chi
1211 Cathedral Street
Baltimore, MD 21201-5585*

For more information, contact the Executive Director's office at 410-539-0872 or 1-800-492-1056.

Computers in the Medical Office

Med Chi's Computers in Medicine Committee is sponsoring "Computers in the Medical Office," a three-part seminar on Saturday, March 7, 1992, from 9 a.m. to 2 p.m. in the Med Chi Faculty Building. The seminar is intended for physicians who want to expand their office computer capabilities or for those physicians who do not yet have computer equipment and would like guidance in the selection of hardware and software.

The first part of the seminar will review computerizable office functions and various examples of software that will meet those functions. The second part of the seminar will address the hardware requirements as determined by needed software and practice size. The third part of the seminar will be hands-on demonstrations of computer equipment by all participants. Registration for the seminar is \$20. Physicians interested in attending should contact Bruno Mattiello at 410-539-0872 or 1-800-492-1056.

Dear Doctor Column

Med Chi is seeking physicians interested in contributing to a "Dear Doctor" column to be published as a Med Chi public service in area newspapers. Physicians from every medical specialty are encouraged to participate in this project that will help convey critical medical information to the public. These columns would be in a question-and-answer format and would be approximately 500 words in length. If you are interested in participating in this project, call Med Chi's Public Relations Department at 301-539-0872.

Medicare Computer Problems—Maryland Blue Cross/Blue Shield

It has come to the Faculty's attention that patients have been receiving from Maryland Blue Cross/Blue Shield EOBs (explanation of benefits) that contain incorrect information. The types of errors that are appearing on the EOBs are

1. The name of the physician providing the services is listed incorrectly.
2. The type of injection given to the patient is listed incorrectly.
3. Claims are being incorrectly rejected for covered services.

Since this information has been generated from the insurance carrier and not from the physician's office, physicians should inform their patients that they should call Medicare's beneficiary telephone line to register their complaints.

The beneficiary telephone numbers for Maryland Blue Cross/Blue Shield are 1-800-492-4795 or 561-4160. Physicians are not to use these telephone lines for provider questions or problems.

Erratum

Incorrect dates for events during the 1992 Med Chi annual meeting were published in the February *Maryland Medical Journal* (MMJ). The correct dates and times are as follows:

Thursday, April 30, 1992

Council 8:30 a.m.

House of Delegates 9:30 a.m.

Saturday, May 2, 1992

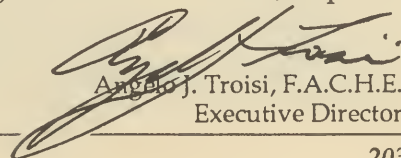

House of Delegates 2:00 p.m.

Council 3:00 p.m.

The correct date for the presidential banquet is *Saturday, May 2, 1992* at 7:00 p.m. For more information about the annual meeting, see the preliminary program preceding this newsletter.

Erratum

Nielsen Andrews co-authored the article "Legislative preview: An overview of legislative issues affecting Maryland medicine in 1992" that was published on page 25 of the January issue of the *MMJ*, along with Gerard E. Evans, Esq.

Angelo J. Troisi, F.A.C.H.E.
Executive Director

New CPT Evaluation and Management Codes for 1992

Questions and Answers

1. What does the term "time" refer to in the codes?

Time in the office or other outpatient services and office consultation categories means the time that the physician typically spends face-to-face with the patient and/or family.

Time for inpatient hospital care, initial and follow-up hospital consultations, and nursing facilities refers to the time the physician spends in the patient's unit and at the bedside.

Time is deliberately not included in the emergency department visit codes because emergency department services are typically provided on a variable intensity basis, often involving multiple encounters with several patients over an extended period of time.

For a more detailed explanation of "time," see the Evaluation and Management Guidelines in the 1992 CPT book, page 4.

2. Does face-to-face time in a physician's office include the time of the nurse if the nurse obtains history, etc. for the physician?

No. Face-to-face time refers to the time with the physician only. The appropriate code should be selected based on the content of the visit or consultation; time is included to assist the physician in code selection.

3. Can time alone ever be used to select a code?

Yes. When counseling and/or coordination of care dominate (more than 50 percent) the face-to-face physician/patient encounter, time is the key or controlling factor. The code selection is based on the total time of the face-to-face encounter, not just the counseling time. The medical record must be documented in sufficient detail to justify the selection of the specific code.

4. If a physician sees his patient in the emergency room and decides to admit the person to the hospital, should both services (the emergency department visit and the initial hospital visit) be reported?

No. When the patient is admitted to the hospital via another site of service (e.g., hospital emergency department, physician's office, nursing facility), all services provided by the physician in conjunction with that admission are considered part of the initial hospital care when performed on the same date as the admission. See page 18 of the 1992 CPT book for more explanation.

5. If a patient is seen in the office at 3:00 p.m. and admitted to the hospital at 1:00 a.m. the next

day, may both the office visit and the initial hospital care be reported?

Yes. Because different dates are involved, both codes may be reported. The CPT states services on the same date must be "rolled up" into the initial hospital care code. The term "same date" does not mean a 24-hour period. See page 18 of the 1992 CPT book for more explanation.

6. Are physicians assigned to the emergency department the only physicians who may use the emergency department services codes?

No. Any physician seeing a patient registered in the emergency department may use these codes.

7. If an office visit is for a true emergency, may the emergency department visit codes be used?

No. The emergency department codes should only be used if the patient is seen in the emergency department. The emergency department is defined as an organized hospital-based facility for the provision of unscheduled or episodic services to patients who present for immediate medical attention.

8. Should non-emergency services performed in the emergency department be reported using emergency department codes?

Yes. The only requirement for using the emergency department codes is that the patient be registered in the emergency department. Normally a lower level emergency department code would be reported for such a non-emergency condition. Office or other outpatient codes should be used if the patient is seen in the emergency room as a convenience to the physician.

9. Referring to number 8 above, will Medicare payment be reduced for the non-emergency service?

No. Starting on January 1, 1992, the site-of-service reduction does not apply to the emergency department evaluation and management codes.

10. May a physician report both a hospital visit and hospital discharge day management service on the same day?

No. The hospital visit descriptors include the phrase "per day" meaning they include all care for a day. Code 99238 (hospital discharge day management services) is used to report services on the final day of the hospital stay. To report both the hospital visit code and the hospital discharge day management services code would be duplicative.

I am interested in serving on the following Med Chi committee(s):

Each year Med Chi requests physicians to serve on its more than 45 committees. These committees are the backbone of our organization and guide the decisions made by Med Chi's House of Delegates, Council and Executive Committee. To assure that Med Chi remains a strong and active organization, it is essential that physicians participate as active members of these committees.

As President for 1992-93, I intend to appoint as many physicians as possible to committees. Please indicate your willingness to serve by checking your preference and special interests on the attached reply card. Every effort will be made to appoint you to the committee of your choice.

Med Chi is your organization. By serving on a Med Chi committee, you can help protect and improve Maryland medicine.

Thank you for your assistance

Jose M. Yosuco MD
President-elect

Our Pictures Are Worth A Thousand Words.™

Case #19

A 50 year old man experienced shoulder pain and weakness after catching himself with his arm during a fall.

DIAGNOSIS: Rotator cuff tear involving the supraspinatus tendon.

Figure 1 demonstrates a torn and retracted supraspinatus tendon (arrow). The tendon defect (arrowheads) can be accurately quantitated to assist surgical planning. Figure 2 demonstrates a normal supraspinatus tendon inserting laterally on the humerus (H). Acromion (A). Glenoid (G). Supraspinatus muscle (SSM).

The supraspinatus tendon represents the component of the rotator cuff most often found to be torn and/or degenerated. Many supraspinatus tendon tears result from chronic abrasion of the tendon by the acromion and acromioclavicular joint. In addition to documenting complete and partial tears of the rotator cuff, MRI also evaluates the relationship between the acromion and the supraspinatus tendon, providing a means to detect impingement before tears have occurred. MRI also proves useful in assessing labral injuries associated with instability, subacromial and subdeltoid bursal fluid collections, biceps tendon tears, and osseous injuries. As with examination of the knee and other joints, MRI provides a comprehensive evaluation of soft tissue and osseous pathology afflicting the shoulder.

Non-surgical treatment for even the most advanced venous ulcers.

The physicians at Vein Clinics of America have successfully treated venous leg ulcers—including advanced cases—in our offices without the use of surgical procedures.

Our two-part ambulatory treatment program includes: 1) Healing the ulcer itself by isometric compression therapy; 2) Addressing the underlying cause and preventing recurrence through injection sclerotherapy of incompetent perforating veins and refluxing varicose veins.

Rapid closing of ulcer.

The common denominator of most leg ulcers is venous pump failure with edema. Our treatment first removes the edema and heals the ulcer through the application of isometric compression bandaging. This increases venous outflow during ambulation, resulting in improved pump action at the calf muscle.

Healing occurs in three to six weeks for most patients, or longer in more advanced cases. Other advantages of this phase include immediate ambulation, rapid elimination of pain and drainage and high patient acceptance.

D.K., a 69-year-old woman with recurrent ulcer and history of skin graft failures, on initial day of treatment. Edema of ankle and inflammation clearly visible.

Effective long-term healing.

Once the ulcer has healed and other problems such as edema and dermatitis are under control, the second phase of treatment can address prevailing underlying causes. Refluxing venous trunks, tributaries and incompetent perforating veins are

eliminated by injection compression sclerotherapy, often guided by Duplex Color Ultrasound.

This selective fibrosis process improves the venous pump, resulting in long-term healing and lowered recurrence of leg ulcers.

Proven treatment program with documented results.

This treatment protocol was developed over 10 years of clinical experience, with favorable results on approximately 500 leg ulcer patients.

Many patients had previous surgery with skin grafting and vein stripping. But our two-step protocol provided more effective healing. This is because the treatment is directed at the underlying cause, the venous pump failure.

For information on how your patients can benefit from this treatment call Louis Ivey, MD, Eastern Region Medical Director at (301) 654-6633.

After 17 days of isometric dressing application, ulcer is responding.

Progressive granulation and healing of ulcer. Considerable reduction of edema in subcutaneous tissues.

Long-term follow-up, including injection therapy shows no edema or ulceration.

**Results Achieved
Without Surgery**

NEW INDICATION

ONLY ONE H₂-ANTAGONIST HEALS REFLUX ESOPHAGITIS AT DUODENAL ULCER DOSAGE. ONLY ONE.

Of all the H₂-receptor antagonists, only Axid heals and relieves reflux esophagitis at its standard duodenal ulcer dosage. Axid, **150** mg b.i.d., relieves heartburn in **86%** of patients after one day and **93%** after one week.¹

AXID[®]
nizatidine
150 mg b.i.d.

ACID TESTED. PATIENT PROVEN.

AXID[®]

nizatidine capsules

Brief Summary. Consult the package insert for complete prescribing information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to 8 weeks of treatment at a dosage of 300 mg h.s. or 150 mg b.i.d. Most patients heal within 4 weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a dosage of 150 mg h.s. at bedtime. The consequences of therapy with Axid for longer than 1 year are not known.

3. *Gastroesophageal reflux disease (GERD)*—for up to 12 weeks of treatment of endoscopically diagnosed esophagitis, including erosive and ulcerative esophagitis, and associated heartburn at a dosage of 150 mg b.i.d.

Contraindication: Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H₂-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H₂-receptor antagonists.

Precautions: General—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix[®] may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chloridazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproductive capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Worldwide, controlled clinical trials included over 6,000 patients given nizatidine in studies of varying durations. Placebo-controlled trials in the United States and Canada included over 2,600 patients given nizatidine and over 1,700 given placebo. Among the adverse events in these placebo-controlled trials, only anemia (0.2% vs 0%) and urticaria (0.5% vs 0.1%) were significantly more common in the nizatidine group. Of the adverse events that occurred at a frequency of 1% or more, there was no statistically significant difference between Axid and placebo in the incidence of any of these events (see package insert for complete information).

A variety of less common events were also reported; it was not possible to determine whether these were caused by nizatidine.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of anti-androgenic activity due to nizatidine. Impotence and decreased libido were reported with similar frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Anemia was reported significantly more frequently in nizatidine than in placebo-treated patients. Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H₂-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Urticaria was reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H₂-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. The ability of hemodialysis to remove nizatidine from the body has not been conclusively demonstrated; however, due to its large volume of distribution, nizatidine is not expected to be efficiently removed from the body by this method. If There is Alzheimer's Disease...

Church Home has been caring for men and women with Alzheimer's Disease since 1987 in a small and very special place we call the Broadway Wing.

The Wing is physically separate from Church Home but, like the Home, directly connected to Church Hospital. It is restful and secure. There are 22 private rooms and an enclosed garden. Nowhere in the Baltimore area is there a nursing staff better prepared—by training, experience, and temperament—for their profession.

One monthly charge covers virtually everything. There will be no hospital bills, no doctors' bills, no bills for medicines. And there is no entrance fee.

For more information or to arrange a visit to the Broadway Wing, call 732-1410.

Church Home

The Broadway Wing
101 N. Bond Street • Baltimore MD

IF YOU'RE LOOKING FOR A LUXURY HOME, LOOK FOR ONE THAT'S AFFORDABLE.

RIVER FALLS
Potomac's Family Community.

From a strictly financial aspect, River Falls homes have performed admirably. Through the ups and downs over the past 23 years, they've posted a track record of significant appreciation and lasting durability. Marketability that's a testament to timeless designs, construction by teams of in-house craftsmen, and one of the most beautiful, convenient locations in the Potomac/Bethesda area.

Today, a River Falls home is still an eminently affordable investment and a smart one too. Four-to-six bedrooms start in the \$600's with absolutely no compromise in quality. There's terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go well beyond dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs. Nearby are excellent public and private schools, convenient shopping and easy access to suburban Maryland, downtown D.C., and Northern Virginia.

Where else can you get such a sound investment with such outstanding returns? Take an hour to visit River Falls and see how great your future can be. For you, and for your family.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.

HOURS: 12-5 daily.

PHONE: (301) 299-3700.

Brokers welcome.

LETTERS TO THE EDITOR LETTERS TO THE

Lend your shoulder

"If I have seen further, it is by standing on the shoulders of giants." So wrote Isaac Newton to Robert Hooke in 1676. Newton obtained his enthusiasm for optics and geometry from his mentor, Isaac Barrow, and was also greatly indebted to Galileo, Kepler, and Descartes. In time, the shoulder of Newtonian physics with its independent time and three-dimensional space would be offered to Einstein who gave new color to mathematical physics and reached forward into the uncharted areas of related space and time. Without the system of Newton, Einstein might not have given us relativity.

Did you know that Newton had a great part in inventing calculus, constructed telescopes, studied light and its refraction, was an astronomer, worked out the principles of gravitation, and was a Master of the Mint? He was a scientist, member of the Royal Society, and sat in Parliament. This portion of his life does not reveal the whole man, however, because the public does not know that his writings in theology would have produced the equivalent of seventeen volumes of average size today.

Newton was a reluctant writer and, upon occasion, had to be urged to put his ideas into print. What a loss civilization might have incurred had he not published!

You may not be a Newton, but you can read, study and write. Although you may not provide a sturdy shoulder to someone in the future, you might offer a little help. Do not give your writing the cold shoulder. Submit an article to the *Maryland Medical Journal*.

National Doctors' Day

To show appreciation for the invaluable contribution physicians make in caring for the sick, advancing medical knowledge, and promoting improved public health, March 30th has been declared National Doctors' Day; its official symbol is the red carnation.

March 30 was chosen as the official day on which to celebrate Doctors' Day, since it was on that day in 1842 that Dr. Crawford W. Long of Jefferson, Georgia, became the first physician in history to use ether anesthesia in surgery.

David Paul, MD – 1st Place Color, 1991 – "Wars End"

Enter the Twelfth Annual Med Chi Photo Contest

Deadline for entries is Friday, April 3, 1992 ● Two categories: Black & White or Color ● Open to all Med Chi and Auxiliary Members ● First and Second Prizes Awarded In Each Category ● All Photographs will be displayed at the 1992 Annual Meeting at the Omni Inner Harbor Hotel in Baltimore.

Photo Contest Rules

- Eligibility:** All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.
1. Photographs may be submitted in two categories: black and white or color.
 2. Limit: three entries per person.
 3. Prints only, no smaller than 8 x 10" or larger than 11 x 14", will be accepted. If your favorite shot is a slide, you must have a print made within these size ranges to enter the contest.
 4. Entries must be matted or dry mounted. No framed photographs will be accepted.
 5. Entries must have name, address, and telephone number attached to the back of each photograph.
 6. Entries may be mailed or brought to Med Chi, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on April 3.
 7. Photographs entered in the contest will be on display at the 1992 Annual Meeting.
 8. Prizes will be awarded to the first and second place winners.
 9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, April 30 – May 2, 1992.
 10. Photographs will not be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting at noon on May 2, or at Med Chi thereafter.
 11. Med Chi does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately 25 to 50 words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of

references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset. ■

TOUGH, SMART AND YOURS

medical
economics
JUNE 1991

Successfully defending a brain-damaged baby case is the courtroom equivalent of pitching a no-hitter. Because the "sympathy factor" can add millions to a jury's award, many insurance carriers would rather settle than fight.

Not so the P-I-E Mutual Insurance Co. of Cleveland, Ohio, and the 4-year-old law firm—Jacobson, Maynard, Tuschman & Kalur—that does all its defense work. In 21 brain-damaged baby cases it has defended for the doctor-owned company, its record is a remarkable 19-1, the last a hung jury. In 1988, its overall record read 31 wins, 5 losses—all malpractice cases.

There's more to these numbers than luck, "the even legal skill" adds JMT&K founding partner Aaron Jacobson, who was one of Ohio's leading plaintiffs' lawyers before he, Larry E. Rogers, Herbert S. Bell, M.D., and 50 other Cleveland doctors formed P-I-E in 1975.

"It's the concept behind the firm that makes it work. Physicians' panels review every case specially panel reviews every defendant to decide whether the defendant deviated significantly from the standard of care. If he did, we pay. If he didn't, we defend. Makes no difference whether it's a \$5,000 or a \$5 million case. We label it 'No pay.' That policy has resulted in a lot of cases being dropped. Perhaps more important, it's

DON'T YOU WISH THESE DEFENSE LAWYERS WERE YOURS?

This big, multistate firm rarely loses a case. But it's more than luck, or even legal skill, that's behind its enviable record.

By Howard Eisenberg

discouraged the filing of many other cases. Plaintiffs' attorneys have learned that we're fair negotiators when our doctor's in the wrong, but won't back down when he's right."

That approach pays off. "According to the most recent report I've seen from the General Accounting Office," says Larry Rogers, P-I-E president and CEO, "in 1984, about 75 percent of medical malpractice claims were closed without payment. Through 1988, we've closed an average of 78 percent of our cases without a dime changing hands. And it's my understanding that, without including defense costs, St. Paul Fire and Marine Insurance Co.'s 1988 average gross payout for cases closed in Ohio with payment was \$52,500. Our comparable figure was about \$10,000 below

theirs. That's partly why we can sell an OBG specialist in Ohio—an industrial state that ranks among the most litigious—\$1.2 million in coverage for just \$25,400."

The unique marriage of P-I-E and JMT&K has been so successful that the carrier has expanded into five other states: Indiana, Kentucky, Maryland, Missouri, and West Virginia. Where P-I-E goes, there goes JMT&K, with nine branches of trial attorneys, and may well be the nation's largest devoted well-versed exclusively to medical malpractice-defense symbiosis. If duplicated by other doctor companies, make a significant contribution to reducing malpractice litigation nationwide? An up-close look at

box, JMT&K operates may help to answer that question.

Every lawyer develops a medical specialty

"Our firm's lawyers read more medical books than law books," says P-I-E Vice President Gerard C. Oppenorth, himself a veteran defense attorney. Robert Maynard explains, "New cases are discussed at our weekly staff meeting, so that every lawyer is familiar with every case. But we assign cases to our attorneys according to medical specialty. They're well-versed in their fields, so they don't have to reinvent the wheel with each case." Last year, the firm's OBG specialist, attorney Jerome S. Kalur, who had won 16 consecutive brain-damaged baby cases, faced one of his toughest challenges when he defended a GP

who attempted a midforceps delivery that ended in a Caesar section and a severely brain-injured baby. Recalls Kalur, "I didn't think the doctor had caused the damage, but our position was weakened by the fact that he didn't have midforceps privileges. Based on that departure from the standard of care, our doctor panel voted to settle, and, since the hospital was also involved, a combined sum of \$1.5 million was offered. Plaintiffs turned us down flat."

"I wanted to depose the doctor, who'd been involved in the mother's care during her hospitalization, but the attorney for the plaintiff baby insisted it would violate the mother's physician-patient confidentiality. That privilege would terminate automatically when her medical

The winning firm's four founders at Cleveland's 8th District Court of Appeals (from left): Jerome S. Kalur, Aaron Jacobson, James M. Tuschman, and Robert Maynard.

records were introduced at the trial end of the plaintiff's case. Meanwhile, I was in the no-win position of having to tell the jury, 'It couldn't have been the midforceps,' without offering them another reasonable brain-damage theory."

Fortunately, the plaintiffs rested their case on a Friday afternoon, giving JMT&K time for a weekend rally. "Twenty minutes later," says Kalur, "I was in the hospital pathologist's office with an order permitting me to view the mother's placental slides." Meconium staining had been charted, and Kalur had a hunch that fetal distress had begun long before the for-

They're seasoned attorneys with an incredible record of success.

Malpractice specialists in every medical specialty.

More than seventy lawyers in eleven offices: they're part of The P-I-E Mutual team ... Jacobson, Maynard, Tuschman & Kalur, a formidable defensive lineup, with an imposing record.

Three-quarters of all claims closed without a penny changing hands.

Ninety percent of the cases that go to trial won.

One of every four doctors will someday face a lawsuit. The P-I-E Mutual helps you face that future without fear. With a claims review committee made up of your peers. And a pre-paid law firm that can rally its total resources against any and all claims.

^{99m}Techetium dimercaptosuccinic acid scan in evaluating patients with urinary tract infection

Fred J. Heldrich, M.D.

Dr. Heldrich is associate professor of pediatrics, The Johns Hopkins University School of Medicine, and chairman, Department of Pediatrics, St. Agnes Hospital, Baltimore, MD. Reprints: Fred J. Heldrich, M.D., St. Agnes Hospital, 900 Caton Avenue, Baltimore, MD 21229.

In clinical practice, determining which patients with urinary tract infection have upper urinary tract involvement is difficult yet important for proper management. This report indicates that the ^{99m}technetium dimercaptosuccinic acid (DMSA) scan is a useful test in making this determination.

To properly manage patients with urinary tract infection (UTI), it is important to determine if the renal parenchyma is involved or if the infection is confined to the lower urinary tract. Tests commonly performed on specimens of blood and urine to make this determination lack specificity and sensitivity in the pediatric population.^{1,2} The diagnostic imaging techniques of nuclear scanning with ^{99m}technetium dimercaptosuccinic acid (DMSA) and intravenous pyelography (IVP) or renal sonography (SONO) were used to identify patients with upper urinary tract infections. This report compares the results of these imaging studies. Positive findings by IVP were dilatation of the pelvis or ureters, cortical thinning, calyceal blunting, a double collecting system, abnormally positioned kidneys, or decreased uptake of the contrast material. Positive findings by sonography were abnormally positioned kidneys or dilatation of the collecting system. The DMSA scans, performed three hours postinjection with the views obtained in the posterior, left posterior oblique (LPO), and right posterior oblique (RPO), were positive if cortical defects of isotopic concentration were noted.

Methods

The records of fifty-one patients with urinary tract infection, who were followed in the renal clinic at St. Agnes Hospital, were reviewed. Diagnosis of urinary tract infection was established by the bacterial colony count per cubic centimeter (col/cc) of urine. A colony count of $\geq 100,000$ col/cc in a clean caught midstream specimen, of $\geq 1,000$ col/cc in a catheterized specimen, or of any growth in a suprapubic specimen, were the criteria used. Patients were evaluated by intravenous pyelogram or renal sonogram plus a DMSA scan within a week of making the diagnosis of urinary tract infection. The results of these studies were tabulated and compared. Although each patient also had a voiding cystourethrogram (VCUG) performed, the results were not included because VCUGs do not differentiate patients with upper urinary tract infection from those with

lower tract infection. Patients' ages ranged from one month to 18 years. There were four males and forty-seven females. Although all patients were being seen by us for the first time, all were not experiencing their first urinary tract infection.

Results

The results of these imaging studies are summarized in the Table. Of the fifty-one patients, twenty-five had positive studies by IVP and/or renal sonogram and DMSA scan. Seventeen patients had positive DMSA scans only. Nine patients had positive IVP or renal sonograms only. Five of these nine patients demonstrated fullness of the renal pelvis, which may or may not indicate infection in the pelvis of the kidney, but not necessarily the renal parenchyma. Four of the nine patients had either a pelvic kidney, double ureter, Hutch diverticulum, or horseshoe kidney, but none of these findings are indicative of infection *per se*.

Discussion

Reported rates of recurrence of urinary tract infection in pediatric patients are high. A recurrence rate of 30 percent following the first urinary tract infection, with higher recurrence rates following subsequent infections, has been reported. A rate as high as 75 percent has been reported following three or more episodes.³ Better means of identifying, evaluating, and treating patients with urinary tract infections may reduce this high rate of recurrence.

Multiple factors determine the success of therapy in patients with urinary tract infections. These include structural abnormalities of the genitourinary tract; host defense mechanisms; and selection, dosage, and compliance in taking the medication. Microbiologic factors include the organism's ability to attach and invade tissue, to resist natural defense mechanisms of the host, or to resist the antibiotic chosen.^{4,5} There is also evidence that results of therapy may vary with the location of the infection (*i.e.*, upper tract versus lower tract) and the duration of treatment.⁶

While recurrent infection is not desirable, infections involving only the lower urinary tract are less cause for concern. Infections of the upper urinary tract are of greater concern because damage to the renal parenchyma may lead to complications such as a reduction in renal function, hypertension, or septicemia during the acute stage of infection.

There are no clinical signs or symptoms that clearly identify patients with upper urinary tract infection. Even patients

with asymptomatic bacteriuria may have upper urinary tract involvement.⁷ Laboratory methods used to differentiate between upper and lower urinary tract infection, such as measurements of renal concentrating capacity or glomerular filtration rate; determination of increased urinary excretion of B₂-microglobulin, urinary levels of N-acetyl-B-D-glucosaminidase, and lactic dehydrogenase isoenzyme V; elevation of anti-Tamm-Horsfall antibodies or the presence of antibody-coated bacteria in the urine; fever; or an elevated C-reactive protein or elevated erythrocyte sedimentation rate, all lack sensitivity or specificity in pediatric patients.^{1,2}

Urine may be obtained from the upper urinary tract by ureteral catheterization or the bladder washout technique; however, anesthesia is required, and neither study is practical for use in the majority of pediatric patients who are diagnosed, evaluated, and managed on an ambulatory basis. Although a biopsy obtained from infected renal parenchyma is the ultimate diagnostic procedure, it is not an ambulatory procedure; and, to be reliable, the aspirate must be obtained from the area of the kidney that is infected. IVP or sonography may document abnormalities of renal tissue as a result of infection but not necessarily an acute infection.

A positive DMSA scan indicates impaired tubular function. This finding is consistent with acute pyelonephritis, but may also be a permanent finding as a result of a past infection.^{8,9}

While the sensitivity of these imaging techniques has not been evaluated against positive bacterial cultures obtained from the renal parenchyma, they do identify upper urinary tract abnormalities consistent with an upper urinary tract infection. The structural abnormalities caused by infection, which are often observed by IVP or sonography, require significant damage to the renal parenchyma (*e.g.*, cortical thinning or calyceal blunting). The DMSA scan identifies functional abnormalities of tubular function consistent with pyelonephritis, either acute or chronic, not always detected by IVP or sonography.

Our findings, obtained in patients soon after diagnosing an acute urinary tract infection, indicate that the DMSA scan is a superior imaging technique for identifying patients with upper urinary tract involvement (Figure 1).

It is our custom to treat patients with vesicoureteral reflux with antibiotics to maintain sterility of the urine, anticipating that the reflux will eventually cease, and the renal parenchyma will be protected. In addition to providing an initial assessment of renal damage, the DMSA scan offers a means to determine if the upper tract becomes infected, or if there is extension of existing renal damage during the period of antibiotic therapy while reflux is present. Likewise, successful management of an upper urinary tract infection may be documented by a DMSA scan that reverts to normal or improves significantly after therapy (Figure 2).

Our policy has been to perform a renal sonogram or IVP plus a voiding cystourethrogram on all pediatric patients with a culture-proven urinary tract infection if these studies have

Table. Results of imaging studies in patients with urinary tract infection

Positive studies	Patients (N=51)
IVP or SONO & DMSA	25
DMSA only	17
IVP or SONO only	9
Hutch diverticulum	(1/9)
Pelvic kidney	(1/9)
Double ureter	(1/9)
Horseshoe kidney	(1/9)
Renal pelvis fullness	(5/9)

Figure 1. DMSA scan of a patient with an acute UTI taken three hours postinjection of the isotope. There is reduced concentration in the cortex of the superior pole of the left kidney.

Figures 2A & 2B. Comparison of DMSA scans of a patient with UTI taken several days after diagnosis (A) and six months later, after completion of antibiotic therapy (B). The films differ in overall density due to a difference in developing technique; however, there is significant improvement in isotope uptake noted especially in the lower pole of the left kidney.

not previously been performed. As a result of our experience, we now include the DMSA scan as part of the initial imaging studies for most patients, but routinely for those less than five years of age; those with a positive renal sonogram, IVP or VCUG; or those with the clinical signs and symptoms suggestive of infection of the upper urinary tract.

Catastrophic Illness is Rare and the Treatment is Critical.

You know the patient. The one with chronic psychosis that hasn't responded to general inpatient care. The patient has comprehensive coverage so you've been able to admit him time and time again for inpatient care. But there's been little if any improvement, and you're frustrated. It's time to refer him to a hospital that is committed to treating the long term refractory patient and has the resources to do it. Sheppard Pratt.

Today's literature discourages long term hospitalization, and we agree. That same literature does, however acknowledge that a small group of chronic patients cannot be treated any other way. In 1984, Sheppard Pratt opened an 18 bed unit that treats only those types of patients.

We are not talking about custodial care nor do we treat patients who spend years talking about delusions. We provide long term, active, behavioral, psychopharmacological treatment for those patients who can genuinely be helped.

In addition to managing systematic and aggressive medication trials, our patients live within an established token economy. Patient education and social skills programming, and specialized activity therapy are provided daily throughout treatment. Formalized psychoeducation is also a vital component of treatment and family involvement. Comprehensive discharge planning is given attention equal to inpatient care. Sheppard Pratt provides many options for aftercare including a quarterway house, supervised housing, vocational training, outpatient therapy and medications management, and day hospitals.

Sheppard Pratt is a comprehensive network of psychiatric services. In addition to our 322 bed hospital we maintain the 16 bed Mt. Airy House, numerous community outreach programs and the National Center for Human Development. For more than 100 years, Sheppard Pratt has earned its reputation for providing quality care to the chronically ill patient. And during these difficult economic times, we remain loyal to that heritage.

Complications of operative and endoscopic gastrostomies

Jeanette Linder, M.D. and E. George Elias, M.D., Ph.D.

Dr. Linder is a resident in the Department of Radiation Oncology, University of Maryland Hospital, and Dr. Elias is director of the Surgical Oncology Program and professor of surgery and oncology, University of Maryland School of Medicine, Baltimore, MD. Reprints: E. George Elias, M.D., Surgical Oncology Program, University of Maryland Hospital, Room #N13E02, Baltimore, MD 21201.

In a retrospective study of fifty cases of gastrostomy insertion performed operatively (OG) or using a percutaneous endoscopic approach (PEG), complication rates were 74 percent (nineteen adults) and 76 percent (seventeen children) in the OG group, and 86 percent (fourteen adults) in the PEG group. While most complications were minor, major ones were usually related to the underlying disease and the general condition of the patient.

Controversy exists over the superiority of various techniques of inserting a feeding gastrostomy tube, whether operative or endoscopic.^{1,2} Each procedure has a myriad of potential complications varying in degree from inconsequential to fatal.^{3,4} These sequelae could be related to the technique and to individual patient characteristics in undetermined proportions. A confounding factor in the study and analysis of gastrostomy tube placement is the relative infrequency of this procedure. In an attempt to clarify which procedure was technically superior, we correlated patient characteristics and the type of gastrostomy used. We have also correlated the indications for gastrostomies to the type of procedure.

Materials and methods

Between July 1, 1986 and June 30, 1988, eighty-three patients in our institution underwent placement of feeding gastrostomy tubes. These were placed operatively (OG) or via a percutaneous endoscopic (PEG) approach. We excluded the few cases in which fluoroscopically guided procedures were done. The postoperative complications, up to thirty days after performing the gastrostomies, were compiled from chart reviews and telephone inquiries of patients' family members or caretakers.

Results

Over a two-year period, 13,303 major surgical procedures were performed at our institution. These included 2,445 abdominal procedures, 1,301 thoracic procedures, 9,474 other procedures, and only 83 gastrostomies. A similar proportion of endoscopic procedures included percutaneous-endoscopic gastrostomies. Despite extensive effort, adequate perioperative follow-up was obtained for only fifty patients. These included seventeen operative gastrostomies in the pediatric group and thirty-three in the adult group, of which nineteen were operative and fourteen were inserted via a percutaneous-endoscopic approach. The age

distribution was obviously skewed for the pediatric population, but was fairly close in the adult groups (Table 1).

There were several indications for gastrostomy tube placement. We divided these into three main categories: anatomic, functional, and miscellaneous. Fifty percent were performed for anatomic indications such as alimentary tract obstruction by tumors, strictures, or developmental abnormalities. Thirty percent were placed for dysfunctional reasons, mostly neuro-motor dysphagia secondary to cerebrovascular accident or hypoxia. The rest were placed for miscellaneous reasons.

There were a total of ninety-seven complications of various magnitudes. There were 37 complications in the adult PEG group, 32 in the adult OG group, and 28 in the pediatric OG group (Table 2). These complications were divided into those related to the procedure and those not related to the procedure. Twelve of fourteen (86 percent) adult PEG cases had complications, as did fourteen of seventeen (82 percent) pediatric OG cases, and fifteen of nineteen (79 percent) adult OG cases. There were no statistically significant differences among them. In addition, there were four perioperative deaths divided equally between PEG and OG procedures in adults. The incidence of complications per case was 2.6 in the adult PEG group; 1.7 in the adult OG group; and 1.6 in the pediatric OG group. The morbidity and mortality related to the procedures included (1) five wound related, four gastrostomy tube related, and two deaths in the adult PEG group; (2) two wound related and four tube related in the pediatric OG group; and (3) one tube related and two deaths in the adult OG group. Several other complications that were not considered to be related to the procedures spanned virtually every organ system. There was bias for particular systems, especially gastrointestinal and stoma-related problems in the PEG group. In contrast, patients with surgically placed tubes suffered from gastrointestinal and pulmonary problems.

Further analysis of the data showed that the majority of complications were not related to the actual placement of the gastrostomy tube. Less than one-third of the adults in the PEG group and only 15 percent of the OG patients had procedure-related complications (Table 2).

We also considered whether the operative gastrostomies were performed as the only primary procedure or as part of another concomitant approach. Only 24 percent of the pediatric gastrostomies were done as the sole procedure compared with over half (58 percent) of the adult gastrostomies. While most of the pediatric gastrostomies were performed as concomitant procedures (76 percent), they had only a 64 percent com-

plication rate. On the other hand, 42 percent of the adult operative gastrostomies that were done during other procedures had a 44 percent complication rate.

Complication rates varied slightly when correlated to the indications and requirements for gastrostomy tube placement. Tubes placed for anatomic reasons had fairly similar incidences, whether they were placed operatively or endoscopically. Those placed for dysfunctional indications tended to have the most complications in the pediatric operative group, with an incidence of 3.5 per case. There was a propensity for complications when tubes were placed for miscellaneous reasons in the adult PEG group, resulting in an incidence of 3.8 per case (Table 3).

Discussion

Insertions of gastrostomy tubes are not frequent procedures. Operative gastrostomies constituted 3.3 percent of all abdominal surgery and 0.6 percent of all surgical procedures in a two-year period in our institution. This did not provide large numbers for intense study. Additional difficulties inherent in the review of such cases included the high frequency of incomplete follow-up. Loss of follow-up was attributed to factors ranging from placement in geographically distant facilities to discharge to homes with relatively unsophisticated caretakers and poor historians. These factors were substantially magnified in our predominantly inner city catchment population. Furthermore, of the eighty-three patients who underwent placement of feeding gastrostomies, complete information was available for only fifty patients up to thirty days postoperatively.

The nature of a retrospective study includes the difficulty of determining the chronologic sequence of events. This information is necessary to know when pairing values for analysis. The unavailability of this information explains the lack of p-values for statistical significance.

Overall, the placement of feeding gastrostomies was not a mild or benign procedure. Neither operative nor endoscopic techniques were without some complications. Since the majority of the complications were not related to the technique of tube placement itself, we could surmise that most of

Table 1. Age distribution

	Endoscopic Adult	Operative Pediatric	Adult
Range	43-97 years	1 day-4 years	31-86 years
Median	68 years	6 months	59 years

Table 2. Number of complications

Complications	Endoscopic Adult (n=14)	Operative Pediatric (n=17)	Adult (n=19)
Procedure related	11	6	3
Not procedure related	26	22	29
Total	37	28	32

Procedure related = wound infection, leaks around tube, blockage of tube, etc., and four deaths in adults.

Not procedure related = pulmonary, gastrointestinal, cardiovascular, genitourinary, etc.

Table 3. Incidence of complications correlated to indications

	Endoscopic Adult (n=14)	Operative Pediatric (n=17)	Adult (n=19)
Anatomic			
No. of cases	5.0	9.0	11.0
No. of complications	12.0	12.0	21.0
Incidence per case	2.4	1.3	1.9
Functional			
No. of cases	5.0	2.0	8.0
No. of complications	10.0	7.0	11.0
Incidence per case	2.0	3.5	1.4
Miscellaneous			
No. of cases	4.0	6.0	0.0
No. of complications	15.0	9.0	0.0
Incidence per case	3.8	1.5	0.0

the problems tend to be related to the patients' primary diseases and general habitus. Since all groups had incidences of complications greater than the number of cases, we could expect a patient with one complication to develop more problems.

We have attempted to use our data to aid in selecting the type of procedures that could minimize the complication rates to a certain patient, considering advantages specific to the techniques themselves. For example, due to the size of the scopes, it is not feasible to use them in very young patients. Furthermore, there are certain anatomic variants that contraindicate endoscopic placement: patients with hypopharyngeal or esophageal tumors that would not allow the scope to pass through safely; patients with organomegaly or large tumors that obscure the gastric pouch; and some patients with previous left upper quadrant abdominal surgery in whom loops of small or large bowel may be interpositioned between the anterior abdominal wall and the stomach. In such cases, the typical location of the stomach, its mobility, or even its accessibility might not be amenable to endoscopic placement. On the other hand, PEG may be considered and carried out concomitantly in patients who are undergoing upper gastrointestinal endoscopy. Similarly, patients who are undergoing surgery for other reasons could have operative placement of the gastrostomy tube at the same time, obviating the need for a second procedure. Furthermore, patients with pulmonary problems may best be served by PEG since the PEG group in our study had fewer respiratory complications than the operative group.

In the unlikely situation that all other variables are equal, endoscopic procedures are usually less costly than the operative ones. In addition, PEGs are performed under light intravenous sedation with no need for general or high spinal anesthesia.

Considering the general condition of the patient, which is always important, one needs to determine the nutritional and surgical risk for each patient early on in the course of his illness. Early recognition and replacement of nutritional deficiencies via parenteral means can maximize recovery once the enteral route is re-established, regardless of the type of tube chosen. We must also keep in mind that parenteral alimentations are better than intravenous hyperalimentation as they are more natural, carry less serious complications, and, overall, are less costly.

Strategies to reduce the high cost of patient noncompliance

Diane L. McNally, B.S. Pharm. and Debra Wertheimer, M.D.

From the University of Maryland at Baltimore where Ms. McNally is a pharmacist in the Department of Pharmacy Practice and Administration, School of Pharmacy, and Dr. Wertheimer is an internist in the Division of General Internal Medicine and Geriatrics, School of Medicine.

The documented low rate of compliance can result from ineffective communication by the pharmaceutical and medical profession, and poor comprehension of prescription instructions by the public. Presented are several examples of how pharmacists can assist physicians in improving and monitoring their patients' compliance behavior. Strategies to enhance communication through the written prescription are offered.

Noncompliance has become a major concern for practicing physicians, pharmacists, and researchers. Between 1981 and 1985, over 2,500 articles related to compliance appeared in the literature, compared with 500 articles published up to 1975.¹ The estimated average compliance rate for a prescribed regimen is 50 percent; compliance rates for chronic therapy and asymptomatic diseases are even lower.² Noncompliant behavior can be exhibited as either overutilization or underutilization of medication.

Overutilization describes patients who take one or more medications at a higher dose or frequency than prescribed by their physicians. It also describes patients prescribed medications from different doctors who are unaware of the other medications the patients are taking, whether prescription drugs or over-the-counter. For example, Dr. Smith, an orthopaedist, prescribes ibuprofen for his patient's sprained ankle, unaware that Dr. Jones, a rheumatologist, has been prescribing naproxen for the patient's arthritis for the past year.

Underutilization includes taking medications at lower doses or at less frequent intervals than prescribed. If a patient does not fill a prescription or stops taking the medication without authorization by the physician, this is considered underutilization. This problem is often seen with antibiotic therapy; the patient feels better in three days, stops taking his or her medication, and has a relapse two weeks later.

The consequences of noncompliant behavior are not benign. Overutilization of medications can place a person at greater risk for an adverse effect. Underutilization of medicines may result in therapeutic failures leading to an increase in disease severity. In either case, the end result may include increased hospitalizations and medical care expenditures. A recent meta-analysis of seven studies revealed that an overall hospitalization rate of 5.5 percent can be attributed to noncompliance.³ This percentage equals 1.94 million annual hospital admissions, at a cost of 8.5 billion dollars.³

Cardiovascular disease management is one example where the costs

of noncompliance are especially high. Noncompliance by cardiovascular disease patients has been estimated to be a factor in 125,000 deaths and several hundred thousand hospitalizations a year. The calculated cost to society is over \$1.5 billion in lost earnings due to lost workdays.⁴

Unfortunately, identifying the noncompliant patient is very difficult. Studies have shown that physicians tend to overestimate patient adherence to treatment regimens.⁵ A relationship between compliance and gender, socioeconomic status, age (except for the very old and very young), or education has not been found.⁶

So, how can physicians better identify and improve noncompliance in their patients? One answer is with the help of community pharmacists. Because pharmacists have frequent and repeated contact with patients, they are in an excellent position to measure and intervene with noncompliant patients. Most pharmacies in Maryland use computers to fill prescriptions; these computers provide pharmacists with the capability of maintaining patient profiles. The computer alerts the pharmacist when patients refill their prescriptions too soon, identifying possible overutilization. The pharmacist's regular review of patient profiles permits identification of underutilization by those patients who are not regularly refilling their prescriptions.

Effective communication must be maintained between the pharmacist, the physician, and the patient to gain the maximum benefit from this partnership. The primary communication between the pharmacist, patient, and physician is the prescription. When pharmacists dispense prescriptions they have the opportunity to reinforce a physician's directions. Reinforcement through repetition is an effective compliance strategy. But, if the prescription says "as directed" or "as necessary," the opportunity is lost. In addition, these nonspecific directions do not enable the pharmacist to measure compliance as assessed by timeliness of refills.

The imprecision of poorly written directions can also influence a patient's ability to comply. To improve patient recall and reduce administration errors, patients require explicit directions. A high percentage of reported administrative errors are due to the direct failure of patients to comprehend the directions on the prescription label.⁷ If given a prescription for tetracycline 250 mg with the directions, "Take one capsule every six hours," how would you take the medication? In one study, only 36 percent of the sixty-seven participants interpreted the directions to mean around the clock, for a total of four doses in twenty-four hours. Approximately 25 percent would have been noncompliant by omitting the late-night dose because they would have divided the day into three six-hour periods while they were awake.⁸ Although in this instance, the pharmacist has adequate information to counsel the patient, the example demonstrates the importance of prescription writing and labeling. Labeling the prescription with the exact times of day the medication is to be taken, such as 6:00 a.m., 12:00 p.m., 6:00 p.m., and 12:00 a.m., may reduce medication errors. Physicians should keep in mind

that patients will be more compliant if the regimen complements their daily schedule, and if the instructions are easily understood. To improve patient understanding, instructions should be written on the bottle and on an instruction sheet in large enough print for someone who is visually impaired.

Even with well-written prescriptions, it is important for physicians and pharmacists to be accessible for verbal clarification of instructions, particularly at transition points. Discharge from an acute care hospital, long-term care facility, or emergency room often results in new prescriptions. One recent study found that 47 percent of emergency rooms visits lead to the prescribing of at least one additional medication, and in 10 percent of those visits, the new medication added a potential adverse interaction.⁹ Since most physicians who see patients in these settings are not the patients' primary physicians, pharmacists need to review these prescriptions carefully. The pharmacists' assessment may find duplicate medications or potential drug-drug interactions between the new medications and previous medications. Determining whether patients are aware of these possible problems is important. If patients are uncertain if they are to use the old medications as well as the new ones, the pharmacist needs to clarify the problem with the physician. To facilitate the resolution of such a situation, it is important for prescribers to print their names and telephone numbers on all institutional prescription blanks.

Communication between the pharmacist and physician is also crucial when there appear to be multiple prescribers. Often patients may see many specialists, increasing the opportunity for serious iatrogenic complications. If a patient patronizes a single pharmacy, the pharmacist has the ability to review the medication profile and prevent any possible iatrogenic problems.

With the growing number of new drugs on the market, the importance of identifying the symptom, indication, or intended effect is amplified. This additional information allows pharmacists to assess compliance and reinforce the physician's instructions. An example is propranolol, which may be used to treat high blood pressure or migraine headaches. It would be nonsensical for a pharmacist to explain how important it is for a patient to take the medication to control high blood pressure even though the patient is not experiencing symptoms, when the patient is being treated for migraine headaches. Knowing the intent of the treatment will aid the pharmacist in communicating with the patient and providing feedback for the physician.

Along with the proliferation of new drugs, there is the issue of higher prices. Over the last decade, the price of drugs has risen faster than the Consumer Price Index.¹⁰ The high cost of medication may be an important factor in determining if some patients will have a prescription filled. Many physicians learn of the latest therapies through contact with drug manufacturer representatives and through the use of samples. However, during the marketing of these medications, the cost is rarely relayed to the physician. Physicians can make use of

community pharmacists as a resource for this information. Pharmacists should alert physicians to the price differential between new drugs and similar older drugs that may be as effective and much less costly. Though a patient's health insurance may cover prescription drugs, health professionals must be cognizant that someone is paying for them (an employer or taxpayers), and select the most cost-effective therapy for that particular patient.

The documented low rate of compliance can result from ineffective communication by the pharmaceutical and medical profession, and poor comprehension of prescription instructions by the public. It is the responsibility of both professions to communicate explicit and appropriate instructions in order to promote compliance and therapeutic outcomes. Improving prescription writing to enhance communication between prescriber, pharmacist, and patient is one strategy. This strategy includes (1) specifying the exact time of day the drug should be administered; (2) including symptoms, indications, or intended effects of the drug; (3) expressing the time period or exact number of refills the prescription may be filled, instead of using *prn*; (4) using generic nomenclature to allow for substitution of less expensive brands, if appropriate; and (5) not using ambiguous instructions such as "as directed." Pharmacists, in turn, need to provide patients with precise directions for medication use. When the pharmacist believes the prescription order lacks clear directions, the pharmacist should contact the physician and clarify the instructions.

A pharmacist's comprehensive drug knowledge can provide physicians with an accessible and indispensable resource. Physicians can obtain unbiased drug information and drug costs from pharmacists. With the help of pharmacists, physicians can better evaluate the drug-taking behavior of their patients, possibly avoiding unnecessary adverse events. Physicians and pharmacists, working together, can improve patient compliance and health outcomes. If, as the studies suggest, half the population is noncompliant and the result is increased health care expenditures, a joint effort using the suggested strategies will have a significant impact on increasing the cost-effectiveness of prescription drug use.

Community hospital implementation of intraaortic balloon pump therapy for complicated myocardial infarction

Daniel I. Woronow, M.D., F.A.C.C.

Dr. Woronow is assistant clinical professor of medicine, George Washington University School of Medicine and attending cardiologist, Holy Cross and Suburban Hospitals.

The intraaortic balloon counterpulsation pump (IABP) has become standard equipment in many community hospitals. Its major role is to support the failing myocardium, and it may also be used to control refractory ventricular dysrhythmia of ischemic origin. The IABP affords stabilization and subsequent transport of complicated myocardial infarction patients who require more definitive therapies. An example is presented of community hospital implementation of IABP in the presence of thrombolytic therapy.

The intraaortic balloon pump may be employed in the community hospital setting to stabilize complicated acute myocardial infarction, even in the presence of thrombolytic therapy.

Case history

A 47-year-old male was referred to the Suburban Hospital emergency room after two hours of substernal chest pain. An exercise tolerance test had been performed one month earlier for mild exertional chest pain, and reportedly was normal. The patient's father had died at age 55 of a myocardial infarction.

The patient was pale and diaphoretic when he arrived by ambulance. His initial blood pressure was 140/100 mm Hg with a pulse of 84 bpm. His electrocardiogram was indicative of an acute inferior wall myocardial infarction (**Figure 1**). Frequent premature ventricular complexes and short salvos of ventricular tachycardia were noted. A 2 mg/min lidocaine infusion was started after a 75 mg bolus. An infusion of tissue plasminogen activator was started, in addition to intravenous heparin therapy. Two minutes later, the patient developed complete heart block, and within seconds, progressed to ventricular fibrillation. Sinus rhythm was restored after cardioversion with 300 watt-seconds, and an additional 50 mg bolus of lidocaine. Multiple recurrences of ventricular fibrillation required four rapid sequences of cardioversion despite a cumulative lidocaine loading dose of 225 mg. The patient rapidly regained consciousness after each successive defibrillation. Serum chemistries and pH were normal. Recurrences of sustained ventricular tachycardia remained unabated despite lidocaine and bretylium infusions.

Angioplasty facilities were not immediately available. Overdrive ventricular pacing with a transvenous lead had no apparent effect on the

ventricular arrhythmia. An IABP was inserted with one-to-one augmentation. There was immediate cessation of ventricular ectopy with the onset of counterpulsation.

With stabilization, and two hours after hospital presentation, the patient was emergently transported by helicopter to the Washington Hospital Center. Coronary arteriography demonstrated nonocclusive plaque rupture with residual

Figure 1. Initial electrocardiogram showing acute inferior infarction pattern with premature ventricular complexes.

Figure 2. A. Angiogram in right anterior oblique projection of right coronary artery showing high-grade ulcerated stenosis (arrow). B. Same artery shows improved patency after percutaneous transluminal coronary angioplasty.

thrombus in the midright coronary artery (**Figure 2**). There was TIMI (thrombolysis in myocardial infarction) grade II arterial patency. Intracoronary urokinase, 250,000 units, was administered. The residual stenosis was treated with coronary angioplasty. Left ventriculography demonstrated an extensive area of inferoapical hypokinesis with an overall ejection fraction of 40 percent. Creatine kinase (CK) peaked at 2,500 IU with an early washout pattern. IABP and antiarrhythmic therapy were rapidly weaned. The patient had an uneventful recovery and had no hemorrhagic complications or difficulties associated with IABP. He was discharged from the hospital eight days after initial presentation. He remains well, with an angiographically patent artery, six months after presentation.

Discussion

Beneficial effects of the IABP during thrombolytic administration appeared to play a critical role in attaining rhythm stabilization in this patient. Primary ventricular fibrillation may be seen in 10 percent of patients hospitalized for acute myocardial infarction.¹ Conversely, arrhythmias associated with myocardial reperfusion rarely degenerate into ventricular fibrillation.² Postinfarction ventricular arrhythmias remain an uncommon indication for IABP insertion.³ Hanson et al noted that postinfarction ventricular arrhythmias were the primary indication for IABP insertion in only 2.2 percent of all insertions at the Massachusetts General Hospital between 1968 and 1978.⁴ Ventricular arrhythmias improved in 86 percent and were completely abolished in 55 percent of all such patients with IABP. Only eleven of twenty-one had concomitant hypotension as an indication. Multiple mechanisms have been postulated for the utility of IABP in acute myocardial infarction. The most reproducible benefit is reduction of afterload resulting in decreased myocardial oxygen demand.⁵ Attempts to document augmented myocardial perfusion have been disappointing.⁶

Community hospital implementation of the IABP for complicated myocardial infarction remains relevant in the era of thrombolytic therapy. IABP is widely available and does not require the in-hospital support of a cardiac surgical program. Therefore, IABP should be considered as a bridge to more specific cardiac intervention in patients presenting with unstable hemodynamics or refractory ventricular dysrhythmia in the setting of acute myocardial infarction.

THE TEST OF PROFESSIONAL LIABILITY COVERAGE ISN'T WHEN YOU BUY IT.

Now Maryland physicians can get coverage from the carrier that offers a

**IT'S WHEN
YOU USE IT.**

stronger support system at the critical time of need than any other company serving the region.

The carrier is the successful physician-owned National Capital Reciprocal Insurance Company: NCRIC.

The leading professional liability carrier in D.C. now comes to Maryland offering unique approaches to service and protection, all at Maryland rates.

For example, you'll be assigned your own NCRIC claims representative who serves substantially fewer clients

than reps with other carriers. So, in claims and underwriting, you'll get

faster, more personal attention to any question or problem, minor or major.

NCRIC also offers especially attractive coverages for physicians just starting a practice, those practicing in

two or more jurisdictions (D.C., MD, VA), part-time practitioners, and physicians who take maternity leave.

Learn more about the ways NCRIC demonstrates a sensitivity to the needs of the medical community in ways no other carrier does. Call (301) 424-8136.

Hypertriglyceridemia: Severe Type V hyperlipidemia in a young woman

Rudolf Titanji, M.D. and Aldo Paz-Guevara, M.D.

From St. Agnes Hospital, Baltimore, MD where Dr. Titanji is a resident in medicine, and Dr. Paz-Guevara is a senior staff member, Department of Medicine and a consultant in endocrinology.

The female patient, a 32-year-old part-time bartender, consulted a dermatologist because she had noted the appearance of yellowish pruritic bumps on her legs, buttocks, and arms. There was no abdominal pain. She had a ten-year history of beer consumption averaging about four cans a day and a five-year history of contraceptive pill use. She had a liberal intake of fats and carbohydrates in her diet. Her family history was positive for diabetes mellitus and coronary artery disease in her grandparents and cirrhosis of the liver in her father. There was no known family history of hyperlipidemia.

Pertinent physical findings included a moderately obese white female weighing 81.5 kg with a height of 1.67 m and a blood pressure of 125/98 mm Hg. Her skin revealed eruptive xanthomata on thighs, back, buttocks, and arms. The fundoscopic examination showed lipemia retinalis. The liver edge was palpable about 1 cm below the right costal margin.

Significant laboratory data. Plasma refrigerated overnight in a tube containing calcium edetate showed a creamy appearance with massive accumulation of chylomicrons in the top of the tube and a turbid infranant layer. Fasting triglycerides were 7,328 mg/dl (normal: 20 to 140 mg/dl); cholesterol was 1,184 mg/dl (desirable levels <200 mg/dl); and gamma glutaryl transferase was 41 IU/dl (normal: 0 to 13 IU/dl). Other liver function tests, as well as serum electrolytes, creatinine, proteins, thyroid function tests, urinalysis, and electrocardiogram, were normal.

The patient was diagnosed as having Type V hyperlipidemia and treated with a dietary regimen of 1,000 calories per day containing 300 mg of cholesterol and 10 percent saturated fats. Alcohol and oral contraceptives were discontinued and 600 mg gemfibrozil p.o. twice a day was prescribed. Three weeks later, the fasting triglyceride levels came down to 54 mg/dl and the total cholesterol to 176 mg/dl. Ten weeks later, the xanthomata cleared completely. The patient did not develop pancreatitis.

Lipoprotein metabolism and transport

Lipoproteins are spherical particles that transport nonpolar lipids through the plasma. Each lipoprotein particle is composed of a *core* that

We present a patient with the typical clinical and biochemical features of severe Type V hyperlipidemia associated with alcohol consumption and estrogen use. Prompt medical intervention resulted in normalization of her lipid profile. We review the lipoprotein composition, the role of lipoproteins in lipid transport with special emphasis on triglycerides, and the clinical features, pathogenesis, and management of Type V hyperlipidemia.

accounts for most of the mass, an oil droplet composed of triglycerides and cholesteryl esters, a *surface coat* of phospholipids, and unesterified cholesterol. Lipoproteins are directed to metabolic sites by apoproteins; these are carrier proteins attached to the particle's surface.¹

Triglycerides are chemically composed of three fatty acids attached to a glycerol molecule. Differences in density have led to the separation of lipoproteins into chylomicrons, very low density lipoproteins (VLDL), low-density lipoproteins (LDL), and high-density lipoproteins (HDL). Chylomicrons remain at the top of the ultracentrifuge; they are very low density lipoproteins, larger than 1,000 Å (Angstroms) in diameter. Their core consists almost entirely of triglycerides. In lipoprotein electrophoresis, chylomicrons migrate to the origin of the paper.

Lipids can be transported by exogenous or endogenous pathways. The exogenous pathway involves the transport of dietary fat. When food reaches the intestinal epithelial cells, dietary triglycerides, phospholipids, and cholesterol are broken down by lipases. These constituents are packaged into large triglyceride rich particles—chylomicrons. The chylomicrons are secreted into the lymphatic space and pass into the general circulation for transport to the capillaries of adipose tissue and skeletal muscle. In the blood stream, triglycerides are bound to carrier proteins Apo A-I, A-II, B48, C-I, C-III, and E. In the capillary bed, they are exposed to the enzyme lipoprotein lipase (LPL), which is activated by Apo C-II and responsible for the lipolysis. During this process, chylomicrons lose many of their triglycerides, which are converted to three free fatty acids. The released free fatty acids bind to albumin, pass through the endothelial cells, and are taken up by the adipose tissue, muscle, or liver.

A second process for lipid transport is the endogenous pathway. When a diet contains excess carbohydrates, the liver converts them into fatty acids, esterifies the fatty acids with glycerol to form triglycerides, and secretes them into the general circulation as VLDLs. The VLDL particles contain Apo B-100 which transports the particles to the tissue capillaries where they interact with the LPL. The LPL enzyme converts the VLDL to intermediate density lipoprotein (IDL).

A portion of the IDL particles are catabolized by the liver. The result is the transformation of the IDL particle into cholesterol-rich LDL. The function of LDL is to supply cholesterol to the adrenal cortical cells, lymphocytes, muscle cells, and renal cells.¹

Diagnosis of hyperlipoproteinemia

Hyperlipidemia results from an increase of lipoproteins, cholesterol, or triglycerides. According to the Fredrickson-Levy classification, there are five types of hyperlipoproteinemias. Type V hyperlipidemia is characterized by excessive amounts of chylomicrons and VLDL, which contain increased triglyceride levels and moderate amounts of cholesterol. Type V hyperlipidemia can result from primary or secondary causes. The most frequently recognized secondary

causes include diabetes mellitus, nephrotic syndrome, hypothyroidism, alcohol abuse, and the use of oral contraceptives.

Alcohol causes hyperlipidemia primarily because it inhibits fatty acid oxidation and enhances fatty acid synthesis in the liver. The excess fatty acids are incorporated into hepatic triglycerides. Some of the excess triglycerides accumulate in the liver, producing the enlarged fatty liver of alcoholics. The remainder of the triglycerides are secreted into plasma, resulting in increased VLDL levels; thus, the plasma concentration of chylomicrons also rises.^{2,3}

The ingestion of estrogen-containing oral contraceptives enhances the VLDL secretion rate from the liver. In most women, this detrimental effect is counteracted by an increase in the catabolism of VLDL, so the net increase in plasma triglycerides is modest. However, in women with an underlying genetic disorder, the ingestion of estrogens can precipitate marked increments of plasma VLDL-triglyceride levels and hyperchylomicronemia. When the latter develops, severe pancreatitis occurs. In addition, the ingestion of oral contraceptives may be a risk factor in promoting thromboembolic disease in young women, particularly those with preexisting hypercholesterolemia. For this reason, it is important to measure the plasma cholesterol and triglyceride levels prior to the institution of birth control pills. The finding of hyperlipidemia is a contraindication to the use of oral contraceptives.²

Clinical and biochemical manifestation of Type V hyperlipidemia

Eruptive xanthomas are believed to be caused by the uptake of lipoproteins by macrophages. The reason they are distributed primarily on the extensor surfaces and the buttocks is unknown.¹ Lipemia retinalis is a curiosity that seldom leads to the diagnosis of hyperlipidemia; rather, it is discovered after an unusual elevation of plasma triglycerides is detected. Neurologic findings such as dementia, memory loss, peripheral neuropathy, and paresthesias have been reported; these manifestations are reversible. Other findings include elevated triglycerides, cholesterol, and chylomicron levels in blood; fatty infiltration of the liver is a frequent finding.³

Pancreatitis can be a serious complication of Type V hyperlipidemia. Its diagnosis is difficult because hypertriglyceridemia can interfere with the estimation of serum amylase. Hyperlipidemia can cause pancreatitis, but the opposite has not been demonstrated.^{1,4}

The circulating chylomicrons inflame the pancreas when they pass through its capillaries. Within the capillary lumen, chylomicrons are exposed to small amounts of pancreatic lipase. This causes partial hydrolysis of the triglycerides and phospholipids of the chylomicrons which, in turn, produce toxic products (fatty acids and lysolecithin) that break down the tissue membranes, produce further leakage of lipase, and eventually cause fulminant pancreatitis.^{1,5,6} The exact level of hypertriglyceridemia may not correlate well with pancreatitis. However, patients with triglyceride values over 1,000 mg/dl should be considered at high risk of developing acute

pancreatitis.⁶ Our patient, with levels greater than 7,000 mg/dl, had no evidence of this complication. The reason some people tolerate higher levels of lipids in their blood without developing pancreatitis is not clear, although the genetic factor in determining the lipoprotein pattern of these patients cannot be ruled out.⁶ The atherogenic effect of hypertriglyceridemia is still a subject of controversy. At this time, there are no definitive studies proving that lowering serum triglyceride levels in Type V hyperlipoproteinemia results in a decrease of atherosclerotic complications.⁷

Patients presenting with eruptive xanthomata should be screened for familial or acquired hypertriglyceridemia, particularly those with a history of alcohol abuse, diabetes, or nephrotic syndrome, or those who are taking estrogens. Most patients can be treated on an outpatient basis, except those patients for whom the possibility of pancreatitis is strongly suspected.

When to treat hypertriglyceridemia? The September 1983 Consensus Conference of the National Institutes of Health recommended that triglyceride levels less than 250 should not be treated. However, triglyceride levels in the range of 250 to 500 mg/dl could be a marker of secondary disorders for a subset of patients with genetic forms of hyperlipoproteinemia who are at increased risk and who need specific therapy. Dietary intervention is the primary approach to therapy in these patients, but drugs have a role in selected persons not responding to dietary management.⁸

Treatment of the patient with Type V hyperlipidemia includes withdrawal of the offending agent, such as alcohol or estrogens, and vigorous treatment of the underlying disorder, namely diabetes, hypothyroidism, or nephrotic syndrome. Caloric restriction is required in the obese subject. Drastic weight loss is not advised since plasma triglyceride levels rise rapidly, and pancreatitis can recur during the periods of rapid weight gain that so frequently follow marked weight loss. In the presence of severe chylomicronemia, a very low fat diet (10 to 20 percent of total calories) may be required to prevent pancreatitis. The diet should be low in saturated as well as unsaturated fats. Implementation of a regular exercise program is important. If the above measures fail to bring the triglyceride levels below 1,000 mg/dl, lipid-lowering agents should be tried—nicotinic acid and fibric acids.^{2,8,9,10}

Maryland Metabolic Institute Announces Their New Location and Continuation of Services

A new strategy to improve patient care

*We help the physician
by helping the patient
help themselves*

Health can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

Training Programs Include:

Diabetes Education

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

Behavior Modification

- weight reduction and maintenance
- modified fasting: Optifast
- limited diets: Optitrim
- full food control: LEARN*
- stress management

Dietary Counseling

- all medical disorders

Call for an appointment or further information or have patients schedule a consultation.

Gastrointestinal surgery for severe obesity: Summary of the National Institutes of Health consensus statement

More than twelve million people in the United States are severely overweight. About four million are so overweight that their obesity harms their health and well-being, making them candidates for surgical treatment.

People at the highest risk of morbidity and mortality can be categorized as having "clinically severe obesity." The ultimate biologic basis of severe obesity is unknown. The disorder is accompanied by reduced life expectancy, and significant psychosocial and economic problems are frequently experienced by severely obese people. These facts lend urgency to the effort to provide rational care.

Weight reduction may sometimes be achieved through medically-supervised dieting and intensive behavior modification, but when these methods fail, gastrointestinal surgery is a therapeutic option for treating severe obesity. In the last ten to fifteen years, many types of new surgical procedures have been developed, using principles of reduction of gastric volume, intestinal malabsorption, or both. Refinements in these procedures have led to reports of successful results superior to those seen with earlier operations.

In an effort to evaluate the objective evidence for these new techniques, the National Institutes of Health (NIH) held a Consensus Development Conference on Gastrointestinal Surgery for Severe Obesity, March 25–27, 1991. A thirteen-member panel developed a consensus statement after considering scientific presentations and discussions from many physicians, scientists, health care professionals, and others. Following are the panel's conclusions.

Risk for morbidity and mortality accompanying obesity is proportional to the degree of overweight. A simple means to define overweight is by the body mass index (BMI). BMI

is a value derived by dividing one's weight in meters. A BMI value of 40 is roughly equivalent to 100 pounds overweight for an average adult male. Approximately 1.5 million Americans have BMI values over 40. Such patients have clinically severe obesity and are at the highest risk of morbidity and mortality. These patients are potential candidates for treatment by surgical procedures.

Limited success has been achieved by a variety of nonsurgical approaches that include medically-supervised dieting and intensive behavior modification. Very low calorie diets (VLCD) have been widely publicized as having dramatic success in the treatment of clinically severe obesity. However, in the absence of successful behavior modification, long-term maintenance of reduced weight is unlikely, and patients regain most of their weight within one year. These diets alone cannot be considered a reasonable option for achieving permanent weight loss. Combining the VLCD with intensive behavior modification may have more potential as an effective regimen for treating the clinically severe obese patient. Exercise or some form of increased physical activity is recommended as a component of weight-loss programs.

Drug therapy for clinically severe obesity has been disappointing. Although pharmacologic studies with anorexiogenic drugs suggest short-term benefit, prolonged and sustained weight loss has not been proven with these agents. Drugs such as amphetamines and thyroid derivatives are unsafe and unapproved.

Medical complications of rapid weight loss can occur and are usually treatable. Potential problems with electrolyte abnormalities and cardiac arrhythmias during administra-

Gastrointestinal surgery for severe obesity: A response

The Consensus Statement on Gastrointestinal Surgery for Severe Obesity resulted from the third National Institutes of Health (NIH) Consensus Conference held March 25–27, 1991. Specialists in surgery, medicine, gastroenterology, nutrition, epidemiology, psychiatry, and endocrinology addressed five questions: What are the nonsurgical treatment options for severe obesity and their consequences? What are the surgical treatments and criteria for selection? What are the efficacy and risks of surgical treatments for obesity? What specific recommendations can be made for the treatment of severe obesity? What are the future directions for basic science, clinical research, and epidemiological evaluation of therapy?

The statement includes basic information about the condition known as severe obesity. (The panel believed the more commonly used term, morbid obesity, is pejorative.) Severe obesity is calculated in reference to the body mass index

(BMI). That is, a BMI of 40 kg/m^2 (weight in kilograms divided by height in meters squared) constitutes severe obesity. This is roughly equivalent to 100 pounds overweight for an average adult male. Thus, severe obesity may be defined as a hundred pounds over normal body weight according to the Metropolitan Life Insurance Company tables of 1983 and/or somewhat less than that when accompanied by significant medical illness such as coronary artery disease, hypertensive cardiovascular disease, renal failure, hypoventilation syndrome, diabetes, or joint problems. Someone over fifty kilograms per meter squared—or 225 percent over normal weight—is super morbidly obese. For the specialist, the BMI formula is exact. For the profession as a whole, it is perhaps not as helpful, and many laypersons will not understand it. One hundred pounds over normal weight is much more intelligible to most patients.

No one disputes the benefits of weight loss for the severely

tion of VLCD generally can be avoided or corrected by the inclusion of high-quality protein and frequent physician surveillance. Recent studies show that rapid weight loss may be associated with a substantial incidence of symptomatic gallstones.

The panel endorsed two surgical treatments for severe obesity; vertical banded gastroplasty and the Roux-en-Y gastric bypass operation. Vertical banded gastroplasty is a form of stomach restriction in which a small pouch is made by stapling off a large section of the stomach, creating a narrow, restricted pathway to the intestinal tract. The Roux-en-Y stomach bypass consists of a small pouch created at the upper portion of the stomach to which a Y-shaped section of small bowel is attached to serve as an outlet from the stomach to the intestinal tract.

The two operations were recommended by the panel for patients whose BMI exceeds 40 and who are judged to have a low probability of success with nonsurgical measures. In certain instances, less severely obese patients also may be considered for surgery, such as those with life-threatening cardiopulmonary diseases or severe diabetes mellitus.

Significant weight loss as a result of these procedures usually occurs, and a number of associated disorders often improve. These include sleep apnea, obesity-associated hypoventilation, glucose intolerance, diabetes mellitus, hypertension, and serum lipid abnormalities. Many patients also report improvements in mood and other psychosocial aspects of their lives. Death rates from these procedures are low, but significant complications may occur, including leaks from staple or suture lines, diarrhea, persistent vomiting, ulcers, and gallstones. In addition, some patients fail to lose weight from these procedures and may require reoperation.

The panel emphasized that deficient nutrition in preg-

nancy carries a high risk of fetal damage or loss. Women with reproductive potential are advised to avoid pregnancy until weight has stabilized postoperatively and micronutrient deficiencies have been identified and treated. Secure birth control methods should be provided for patients during the period of weight loss after surgery. Women who become pregnant following these procedures need special attention. The increased nutritional needs and the normal need for weight gain during pregnancy must be emphasized as part of the obstetrical management of these patients.

Patients seeking therapy for the first time should be considered for treatment in a nonsurgical program with integrated components of a dietary regimen, appropriate exercise, and behavioral support and modification. Patients who are candidates for surgery should be selected carefully after evaluation by a multidisciplinary team with medical, surgical, psychiatric, and nutritional expertise. Postoperative care, nutritional counseling, and surveillance should continue for an indefinite period.

Future directions for research include a recommendation that centers be developed that can manage patients with clinically severe obesity, using a multidisciplinary approach. The panel also recommended that these patients be entered into controlled investigations with long-term follow-up. The panel also emphasized the need for well-organized clinical trials that address critical issues surrounding surgical procedures, and better vocabulary and nomenclature to define terms related to obesity.

Single free copies of the complete *NIH Consensus Statement on Gastrointestinal Surgery for Severe Obesity* may be ordered from the Office of Medical Applications of Research, NIH, Building 1, Room 260, 9000 Rockville Pike, Bethesda, MD 20892 (301-496-1143).

obese. Disagreement centers on the modalities to bring it about. Participants in the consensus conference did agree that medical treatment, diet, behavioral therapy, and psychiatric treatment have not proved particularly effective as far as severely obese patients are concerned. The data show that between 96 and 98 percent of nonsurgical modalities fail: the benefits do not last five years. Diets are the most popular treatments. Diet programs have become a several billion dollar industry, but rarely work. The option known as very low caloric diets (VLCDs)—400 to 800 calories a day with increased protein and minimal fat—does achieve significant weight reduction. A loss of 40 pounds over twelve weeks can be expected. But patients normally gain all their weight back within one year, and each time they diet, they gain the weight back faster and overshoot the previous weight. It is thought that all diets cause a lowering of the basal metabolic rate and when persons break the diet, they will process calories in a

more efficient fashion, thereby, regaining the lost weight. People who are severely obese almost always have a low metabolic rate, so that diets are at best a temporary aid.

Other options in vogue for weight loss are behavior modification, exercise, and drugs. "Behavior modification" is on the lips of every physician. However, data presented at the conference demonstrate that behavior modification typically results in a loss of, at best, some 30 or 40 pounds. And, there are no significant data to show that the results are any more lasting than in the case of diets.

Neither is exercise effective. The advocates of exercise therapy admit that it works only if a person does one hour of aerobic exercise a day; for most people that is an unrealistic expectation.

Drugs simply suppress appetite, which returns after the drugs are discontinued. Amphetamines and thyroid medications are simply unsafe.

The surgeons at the consensus conference presented clear data to show that surgical means have achieved significant permanent weight loss, with a mortality rate of less than 1 percent. This is important as the mortality and morbidity rate of severely obese people, especially males, can be as much as twelve times that of the general population.¹

The two most common surgical treatments for severe obesity are vertical banded gastroplasty and gastric bypass. A third, the biliary-pancreatic bypass, is a more radical malabsorptive operation which is more popular in Europe than in the United States. The operations work by restriction of food intake through size reduction of the gastric pouch and/or by malabsorption of nutrients. My personal preference is for the gastric bypass because it results in somewhat better weight loss and is not quite as obstructive as the vertical banded gastroplasty in which a band is placed around the gastric pouch outlet.²

Despite the demonstrated effectiveness of surgery, the panel seems cautious in discussing surgery's application to particular patients. The statement says, "Patients seeking therapy for the first time should be considered for treatment in nonsurgical programs." Those include diet, exercise, and behavior modification. While that course is appropriate for the moderately obese, it will not be efficacious with the severely obese. The panel issues a further caveat about highly motivated patients. "The possibility should not be excluded that the highly motivated patient can achieve sustained weight reduction by a combination of a supervised low-calorie diet and prolonged, intensive behavior modification therapy." The panel, however, offered no data to support that conclusion. In my opinion, as soon as the patient reaches the formulaic number of 100 pounds over desirable weight, the first preferred option should be surgical intervention. Other options have simply failed, as the panel notes in summing up its discussion of these treatments: "Although acceptable weight reduction may be achieved, a major drawback to the nonsurgical approach is failure to maintain reduced body weight in the vast majority of patients."

In the selection of surgical candidates, the first criterion is actual weight. In addition, the panel calls for "a complete medical evaluation by a multidisciplinary team with experience in obesity management." I dispute this stipulation. First of all, I would be hard pressed to find a multidisciplinary team. Even if the surgery were done only at medical centers, there would not be enough bariatric specialists to meet the demand. And, if the specialists were available in sufficient numbers, who would pay for the evaluation? The typical patient cannot afford to do so. Furthermore, physicians do not exact that kind of evaluation in the case of any other disease. As long as the patient is evaluated by a good internist or family practitioner, the multidisciplinary evaluation seems unnecessary unless specific problems indicate the need for other expert opinion.

In practice, surgery for severe obesity is a last resort. By the time patients consult a surgeon, it is already clear that other options are not going to work. It is not realistic to ask them to try alternative therapies in order to certify that they have exhausted all other options. The literature abounds in data showing that the alternatives are unlikely to work. Severe obesity is, as the consensus statement says, "a chronic intractable disorder."

The consensus statement appears to lay down still another stipulation when it asserts that "Gastric restrictive or bypass procedures should only be considered for well-informed and motivated adult patients with acceptable operative risks." If the patients qualify as acceptable operative risks, then, insurance companies argue, they are not really ill. They do not have high blood pressure or diabetes, so the patients must not really need the surgery but must be seeking purely cosmetic benefits. It is a struggle to get insurance companies to recognize severe obesity as *itself* an object of treatment. For instance, I have a 25-year-old patient who weighs 391 pounds. She is being challenged to prove that she is genuinely ill; otherwise, the insurer will not approve her surgery. What does she need to say other than that she weighs 391 pounds? Are we to wait until her bones disintegrate or until she develops cardiovascular disease—in short, becomes truly an operative risk? A patient who needs the operation is, by definition (or will be shortly), already suffering from some of the conditions that make him or her an operative risk. People cannot walk around with these levels of weight without an eventual deterioration of health.

Following surgery, the resulting weight loss generally effects an amelioration of co-morbidity factors such as hypertension, glucose intolerance, sleep apnea, dyslipidemia, and diabetes mellitus. Something like 80 percent of patients with diabetes mellitus improve significantly after weight loss. The same is true of those with high blood pressure, high lipids, joint and back problems, symptomatic varicose veins, hiatal hernia, hemorrhoids, and snoring complaints. Patients also report improvements in mood and other psychosocial aspects.

The incidence of complications from surgery is between 7 and 10 percent. These include staple line disruption, diarrhea, ulcers, gallstones, and vomiting. The appearance of gallstones is a common occurrence following gastric surgery since loss of weight is lithogenic. One of the problems I have seen, since the bile is diverted downstream, is the development of ulcers in about 10 percent of patients.³ So I now make sure that for many weeks after surgery, patients are on an anti-ulcer regimen. (I also had one patient who developed symptoms of hypoglycemia following the surgery. She was found to have an islet cell tumor. The gastric bypass acted in a provocative fashion and produced the symptoms of hypoglycemia; then the condition could be diagnosed. Prior to surgery, she had never had such symptoms. In fact, multiple fasting blood sugars were normal.)

Commentary

Some patients fail to lose weight after surgery. An operation is considered successful if the patient loses 30 percent or more of total body weight; a 25 percent loss is viewed as acceptable. Anything less is defined as a failure. The most common cause of failure is a staple line disruption. Other patients may be grazers; despite the reduction in the size of the gastric pouch, they find ways to ingest large amounts of calories (e.g., drinking high-calorie soft drinks or alcohol). I will be reoperating on a patient whom I initially thought had had a staple line disruption. Prior to surgery he weighed 418 pounds; three years later he is at 390. He has slowly and methodically continued to eat. I assume he eats all day long. I will take the Y-loop of the bypass further downstream to induce greater malabsorption (i.e., I will convert him to a biliary-pancreatic bypass).

Although surgery always aims for perfect results, we have not yet succeeded. We find that, four or five years after the gastric surgery, there is usually a weight gain of 10 to 20 pounds. But it is important to emphasize that our objective is not to make svelte people. Although most patients are still overweight years after surgery, they are immeasurably improved. A layperson might ask if patients continue to lose weight without stopping. They do not. I did, however, have one patient who developed anorexia nervosa. She got down to 155 pounds but decided she would look much better at 105. With appropriate treatment, she recovered. Typically, a patient levels off around twenty to forty pounds over ideal weight.

As the statement indicates, long-term patient follow-up is necessary. Nutritional counseling, surveillance, and postoperative care should continue. After doing these operations about once a month for five years, my own experience is that the operation initiates a lifelong commitment to the patient. It is not a matter of performing the operation and leaving the patient to his or her own devices. Patients must be checked to make sure they do not slip. I also work closely with a nutritionist who monitors the patients and prescribes vitamins and minerals.

Because the radical weight loss following surgery can precipitate major life changes, including changes in personality and in relationships, a support group of some sort should be offered. Changes are, for the most part, positive (e.g., self-image improves tremendously). In the support group, my patients talk about everything from what they can and can not eat, to ways to handle dumping (the osmotic pull of carbohydrate particles causing weakness), to changes in personal appearance, to family and work relationships. The support group often serves as the context for discoveries about the health process. The surgery, for example, has its own built-in behavior modification. Since people who have had the surgery cannot eat very much at any given time, they quickly learn to adapt. They eat more slowly and eat smaller amounts. It is also true that many patients who formerly ate red meat or who drank milk are unable to do so after the

surgery. Every person's experience is unique. As a group, they can talk about emotional experiences, home problems, and conflicts. I remember one patient whose husband was force-feeding her. His first wife had weighed 450 pounds, and he could not accept the fact that his second wife had dropped from 300 to 200 pounds. Group members benefit from talking together or they may be left with problems they can not manage and which may not be addressed or discovered by the physician.

In addressing future directions, the consensus statement speaks of the need for centers that can manage patients with severe obesity in a multidisciplinary approach. That idea is sound, but we cannot rule out other settings; there are too many people suffering from this disease.

I see the *Consensus Statement on Gastrointestinal Surgery for Severe Obesity* as an important step. For the first time we have a clear consensus that gastric surgery is a valid treatment option for severe obesity. I think the panel was generally fair in its assessment. The panelists were not selected for specific expertise in obesity. Rather, they were from a variety of medical fields, and were asked to keep an open mind and to listen to the papers.

I think the statement will steer medical personnel to consider whether patients might benefit earlier from gastric surgery. Gastric operations have been in use since 1968 when Dr. Edward Mason did his first gastric bypass for obesity. Although some physicians may be concerned about the morbidity and the mortality associated with surgery, the morbidity and mortality of someone left in an obese condition can be far worse.

My own involvement in this specialization came about gradually. Intestinal bypass operations seemed parallel to giving someone a gallon of milk of magnesia a day; the surgery was simply causing rapid transit time, and the malabsorption was based on that. But the gastric operation interested me because I grew up at a time when gastric surgery was often used for peptic ulcers. One fact that was quickly noted in the literature was that after a gastrectomy for ulcers, patients invariably lost weight. So when Dr. Mason began to talk about gastric bypasses, my interest was piqued. In addition, the sequelae of those gastric operations were not that serious. They included dumping, which we are able to treat by dietary modification and medication, and malabsorption of B₁₂ and iron.

It seems to me that we need to assess our present position as a profession. Today, most everybody is interested in breast cancer, but interest in severe obesity lags. It is curious to me that laypersons have taken the lead in the management of this condition—creating programs like Nutrisystem, Opti-Fast, and Weight Watchers—while physicians have virtually ignored the whole matter. Many physicians would rather treat its consequences. The prevailing opinion is that obese people have brought the condition on themselves because of their

Commentary

own sloth, and for the most part, that is not true. There *are* compulsive eating disorders. I do not believe that most physicians even think about treating obese patients surgically. Very few physicians really treat obesity at all except to say, "Here's a diet plan. Follow it." I think the condition is looked at somewhat in the same way as alcoholism. "You're an alcoholic. Join AA." That is not going to work.

One outcome of the consensus conference is to signal physicians that we now have an effective modality to treat severe obesity. Unfortunately, an earlier group of operations to treat severe obesity—the intestinal bypass procedures—proved disastrous. A myriad of problems resulted, including diarrhea, renal stones, electrolyte imbalance, decreased bone density, bypass enteritis, and devastating liver disease. So when another group of operations dealing with the stomach emerged, physicians probably dismissed them as well.

The people who suffer from severe obesity are a unique group. They are vilified as a consequence of the way they look. They experience discrimination. Most of the severely obese are women, who have gender-related prejudice to deal with as well as their weight. They are looked upon with considerable disfavor not only by their peers but by physicians as well. Physicians do not like fat people; surgeons as a group do not like them either. Fat people are harder to treat if they have a medical or surgical illness and they are difficult to manage.

The audience at the NIH consensus conference was composed almost entirely of members of the medical profession. But also in the audience were two women from the National Association for the Advancement of Fat Americans (NAAFA). One weighed 350 pounds and the other almost 500 pounds. They objected vigorously to the conference altogether. Being fat, they insisted, is okay; they did not need our help, either medical or surgical. They drew a lot of fire from the audience. Later I spoke to one of them, the president of the association. I tried to explain that they were at a medical conference, and that physicians do disagree among themselves without being confrontative. "We're really on your side," I said. "We're trying to save your lives." She looked at me and smiled.

A Clinical Moment with . . . Diabetes

Gestational diabetes mellitus

Doctor, I have been a physician for forty years. Today I received a letter from my daughter who is pregnant. Her doctor told her she has developed diabetes. Neither I nor my wife have diabetes. Can pregnancy cause diabetes?

Less than 1 percent to more than 20 percent of women develop an impaired glucose tolerance (IGT) during pregnancy. In fact, pregnancy is normally accompanied by a mild degree of glucose intolerance and occasional glucosuria. Impaired glucose tolerance discovered during pregnancy is termed gestational diabetes mellitus (GDM). A known insulin-dependent diabetic patient (IDDM) who becomes pregnant is not classified as having gestational diabetes.

All pregnant patients should be screened for diabetes mellitus. It is most likely to be found in obese women, in those with glucosuria, and in those with a family history of the disease. A good procedure is to screen for diabetes at the first visit, at the twenty-fourth to twenty-eighth week of gestation, at the thirty-second week, and at any other time that signs or symptoms of the disease occur. If glucose intolerance occurs before the twentieth week, it probably represents an asymptomatic abnormality in carbohydrate metabolism that antedated the pregnancy.

Screening for diabetes during pregnancy can be done by one of the following methods:

1. Fifty g. of glucose load given at random with a one-hour post-load plasma glucose test. The cutoff point for positivity is equal to or greater than 130 mg/dl.
2. A 75 g. glucose load given at random with a two-hour fingerstick test. The cutoff point for positivity is equal to or greater than 120 mg/dl.
3. A 100 g. glucose load given fasting with a two-hour plasma glucose test. The cutoff point for positivity is 140 mg/dl.

If the screening test is positive and a follow-up plasma glucose test is confirmatory, a glucose tolerance test is not necessary and would be considered a risk to the patient. If in doubt after doing a screening procedure, the standard glucose tolerance test for gestational diabetes is done as follows:

1. The test is performed in the morning after an overnight fast of eight to fourteen hours and at least three days of unrestricted diet (greater than 150 g. of cholesterol intake per day).
2. There is unrestricted physical activity prior to the test.
3. A 100 g. oral glucose load is given in a volume of at least 400 ml of fluid.
4. Venous plasma glucose amounts are measured fasting and at one, two, and three hours (Table).

Table. Diagnostic criteria for gestational diabetes from the National Diabetes Data Group

Fasting	105 mg/dl.
1 hour	190 mg/dl.
2 hour	165 mg/dl.
3 hour	145 mg/dl.

Two or more values must be met or exceeded to be confirmatory of diabetes mellitus.

Treatment is the adjustment of the meal plan, if indicated, and increased exercise. While controversial, most authorities believe that caloric restriction in obese pregnant women is contraindicated. If dietary management does not maintain the fasting plasma glucose at or less than 105 mg/dl and/or the two-hour postprandial plasma glucose at 120 mg/dl or less within a two-week interval, insulin therapy should be initiated. Biosynthetic human regular insulin should be used in one or more doses daily. Many of these patients are excellent candidates for insulin pump-type therapy. Sulfonylurea drugs do not have the Food and Drug Administration (FDA) approval for use during pregnancy.

Postpartum, these patients

- May revert to normal. Previously abnormal glucose tolerance (Prev AGT)
- May remain impaired. IGT
- May have persistent diabetes. IDDM

Thirty to 40 percent of gestational diabetes mellitus patients will develop diabetes within five to ten years after parturition and should be followed closely. Prevention of future pregnancies and strict weight control might be deterrents in the development of IDDM.

The newborn infant should usually be managed in the intensive care unit of the nursery.

STATE OF THE ART

DIAGNOSTIC TECHNOLOGY

Magnetic resonance imaging (MRI) is an important tool for today's physician. MRI produces VIVID images of the body in multiple planes. It is a painless procedure that does not involve surgery or potentially harmful radiation. MRI is frequently recommended for evaluation of neural, spinal, articular and pelvic disorders. It is safe and cost effective, and its various applications are being expanded at an impressive rate.

Health Images facilities are a community resource available to all area physicians.

Imaging Case of the Month

A middle-aged African-American female presented to the neurology service due to increasing severity of headaches. The patient complained of decreased sensation in her hands. Results of physical examination demonstrated atrophy of the fine motor muscles of her hands, as well as scars and burns on her fingers. The patient had decreased pain and temperature sensation in her arms and hands, with preserved pain and temperature sensation in the lower extremities. Due to the constellation of signs and symptoms, a magnetic resonance imaging (MRI) examination of the skull base and cervical spine was performed (Figures 1 and 2).

Figure 2.

Figure 1.

Imaging Case of the Month

Imaging Case of the Month is a new department of the *Maryland Medical Journal* which will be featured on a regular basis. Coordinated by the Maryland Radiological Society, the cases will review a broad range of diseases and pathological processes of interest to a wide range of specialists. Physicians interested in submitting cases for publication consideration should contact the Department Editor.

Arnold-Chiari I malformation with syringomyelia

Figure 1. Sagittal T1 weighted MRI scan of posterior fossa, brain stem, and cervical cord demonstrates downward displacement of the cerebellar tonsils (curved arrow) and a large syrinx cavity commencing in the upper cervical spine and continuing inferiorly into the thoracic spine (straight arrow).

Figure 2. Axial T1 weighted MRI image demonstrates the large low signal syrinx cavity within the center of the cervical cord (arrow).

Discussion

This patient presents with the classic signs and symptoms as well as radiologic findings of the Arnold-Chiari I malformation. Arnold-Chiari I malformation is defined as the downward prolongation of the cerebellar tonsils posterior and posterolateral to the cervical spine cord, usually to the level of C1 and sometimes as low as the C2 or C3 level.¹ A Chiari I malformation will have tonsillar herniation ranging from 3 mm to several centimeters below the posterior margin of the foramen magnum.² The cerebellar tonsils often assume a peg-like configuration. As opposed to the Chiari II malformation, there is no caudal displacement of the medulla or inferior vermis of the cerebellum in Chiari I malformation. The fourth ventricle usually maintains a normal position, though it may be distorted in shape.

Chiari I malformation is associated with syringomyelia in up to 80 percent of patients.³ In Arnold-Chiari I patients, there is often arachnoidal scarring and adhesions in the region of the cisterna magna causing matting of the tonsils, vermis, cord, and medulla. The degree of adherence may be related to the likelihood of developing syringomyelia, by causing the thrust of cerebrospinal fluid pulsations to be directed into the central canal of the cord.⁴ The signs and symptoms in this malformation are related to the compression of the spinal cord

or cerebellum, or to the syringomyelia. The onset of symptoms is usually delayed until adulthood.⁵

Associated findings in Arnold-Chiari I malformation include the aforementioned high incidence of syringomyelia, basilar invagination in 25–50 percent, and increased incidence of atlanto-occipital and atlantoaxial fusions. Other skull base malformations and cervical spine malformations (such as Klippel-Feil syndrome) may occur.^{1–5} The cisterna magna in these patients is often small. Hydrocephalus may be seen in up to 44 percent.⁵

MRI is the single best imaging technique for the evaluation of Chiari malformation due to its ability to image structures in multiple planes; ability to image the brain, spinal cord, and cerebrospinal fluid spaces without the use of intrathecal contrast; and the lack of bone scatter artifact at the skull base.

Censors of Maryland

One of the small thrills of answering a reference question in the Faculty archives is coming across something of interest that has little or no bearing on what you were actually seeking. This happened to me recently while trying to track down some material on nineteenth century medical prizes. Digging through one of the many unsorted storage boxes in the Faculty basement, this one marked "nineteenth century," I discovered half a dozen records and reports from the early Medical Board of Examiners and Censors, which was operated by the Faculty.

As the examination and licensing of physicians was one of the primary reasons (though by no means the only one) for which the Medical and Chirurgical Faculty was founded, coming across these records was more than just a pleasant surprise. Though they are mentioned in several places in Cordell's *Medical Annals*, actually having access to them could provide more primary information about the Faculty's first several decades than we currently possess.

The history of medical licensing in colonial America is a long one, rife with accusations and countercharges from those involved on both sides of the issue. In fact, to cover all aspects of the issue would require more space than the *Maryland Medical Journal* provides, so the following is only a capsule summary. The goal of the Medical and Chirurgical Faculty as regards licensing was succinctly summed up by President John Quinan in 1886 in his presidential address on the history of the Faculty at the annual meeting for that year:

The promotion and dissemination of medical and chirurgical knowledge throughout the state...and prevention of its citizens from risking their lives in the hands of ignorant practitioners or pretenders of the healing art. The Faculty granted, via the Medical Board of Examiners, power to grant licenses to such medical and chirurgical gentlemen as they, either upon full examination, or upon the production of diplomas from some respectable college, may judge adequate.¹

Though initially granted far-reaching powers of review over physicians in the state, the force of the law was increasingly diluted by the Maryland state legislature, causing the Faculty license to lose any semblance of regulatory status. This dilution of the law can be seen readily in the broad interpretation in 1838 of a decision that allowed Thomsonians² to charge fees for services. After addressing the specific issue of the Thomsonians, the act went on to allow "any citizen of Maryland to charge or receive fees for medical services as physicians as are now permitted to do." This, in effect, allowed any persons who wished to claim they were doctors to do so and to charge the appropriate fees.³

This is exactly what did occur in Maryland as a result of this law and similar laws around the country. Though widespread, the phenomenon was hardly new. William Smith, writing of New York in 1758, claimed that "quacks abound like locusts in Egypt, and too many have recommended

themselves to a full and profitable practice and subsistence."⁴ The situation in the new world due to the lack of standards, both before and after the American Revolution, was ripe for encouraging both quacks (**Figure**) and true physicians. Also, as was pointed out in the Faculty's sesquicentennial history, the low expectations of the public were as much at fault as the lack of standards: "the easy entrance of charlatans into a practice that sometimes proved lucrative was furthered by a high degree of credulity in the public."⁵

By the latter part of the eighteenth century and the start of the nineteenth, the country was practically swamped with medical personnel. It was common knowledge among both those already established in the United States and recent emigrants, that many of these exparte physicians were not exactly the cream of the crop of the European medical community. After all, what educated physician would willingly give up the social position, limited as it was, that even a moderately successful practice in Europe would provide, for the uncertainties of the new world? Consequently, even those physicians who had degrees from a medical school were not fully trusted by the general public. One frontier family wrote that "doctors were suspect...to be sent for only as a last resort...sick people did get well sooner or later, if they didn't die."⁶

In addition, common folk were more likely to turn first to a nontraditional practitioner (Thomsonian, Botanic, and the like) before an educated physician, whether the physician was a recent emigrant or a native-born and trained American. William Lindsey writes in his medical journal of a young girl who suffered a fractured arm as a result of being run over by a carriage. Yet, it was a "steam doctor" who was contacted first. It was only after this pretender announced that the arm was not fractured and he remained unable to effect a cure that he was dismissed, and the licensed Dr. Lindsey was called in.⁷

Figure. An example of one of the early American "home remedies" is the Perkin's Tractor developed in the 1780s by Elisha Perkins (1740–1799). A popular maker of home remedies, Perkins has long been regarded as one of America's earliest medical quacks. The claim that Perkins made for his metal tractors was that by drawing the point of the tool across an injury or pain, it would draw out any harmful forces and facilitate healing. The tractors were widely popular for a brief period of time.

The feelings of mistrust were common throughout Maryland, and Medical and Chirurgical Faculty members were acutely aware of it. Men like George Brown, John B. Davidge, and James Steuart knew that it was not enough for the Faculty to license qualified physicians who were willing to submit to the Faculty's examinations; those who were not qualified and licensed had to be sought out and their faults brought to light. "In the three years (1799–1803) of the existence of the [Faculty], there had been frequent violations of the law"⁸ — exposing fraud would be the only way the public could be expected to trust someone who claimed to be a physician. Thus, the censors came into play.

The censors in Maryland were often young physicians who, according to the Faculty, displayed the qualities necessary to be responsible members of the medical profession. One of these young men was D.M. Reese. Born in Maryland in 1800, Reese received his medical degree in 1819 from the University of Maryland and accepted positions as both censor for the third ward of Baltimore and as one of several vaccine physicians for the city in 1824. From 1841 to 1842, he served as professor of medicine at Castleton College in Vermont. Reese returned to the Baltimore area in 1842 as professor of the Institutes of Medicine and Medical Jurisprudence at the Washington University. A physician dedicated to the advancement of his profession, Reese was also one of the founders of the New York Academy of Medicine, served as vice-president of the American Medical Association (1857), and helped to edit both *Cooper's Dictionary of Practical Surgery* and the *American Medical Gazette*.

The following letter was written by Reese in 1824 to then President George Frick regarding an *Indian Doctor*. The title of *Indian Doctor* is interesting when one considers the low esteem in which Native Americans were held by most white settlers in the 1800s. The sesquicentennial of the Faculty offers the added insight that "men and women who were properly scornful of the primitive attainments of the Indian in the practical arts had, nevertheless, great faith in any nostrum described as an Indian remedy."⁷

June 5, 1824

Sir,

The censor of the Medical and Chirurgical Faculty of Maryland for the third ward, city of Baltimore, would respectfully represent

That Dr. Job Smith, the *Indian Doctor*, whose prosecution was entrusted to him at the last convention, and in which case a committee was appointed to assist in inflicting the penalties of the law, has left the city on being notified of the intention of the Faculty toward him. Of course, the committees were not required to pay attention to his case.

He has been succeeded, however, by another self-styled *Indian Doctor*, whose obscurity would seem to render it unnecessary to take notice of him, were it not my duty in making this report to mention all unauthorized practitioners in my district.

The members of this Faculty are generally informed that a man styling himself Doct. A. Martin, has been dealing in the "work of death" very extensively in this city during the last few months, by the use of the medicines of M. Le Roy. The

repository of the specific of this very popular quack is in the third ward from which he deals out his drugs "of which he knows less" with great diligence and success, at least a pecuniary point of light. When, however, a number of professional gentlemen complained to me of being greatly annoyed by his interference and a number of his patients, having received the wages of their folly and credulity, urged the propriety of punishing this pretender, I took no official notice of him whatever. But these complaints being louder and more numerous, I thought proper to address him a note, acquainting him with the law of the state, his liability to punishment, and my duty towards him; at the same time offering him any facilities in my power by introducing him to the Board of Examiners should he be willing to appear before them.

The result of this communication was an immediate interview, in which he at first attempted to show that he was not amenable to the law having sold only the specifics of M. Le Roy, but finding that I possessed evidence to convict him of having received fees in advance of curing persons, upon whom the grave had closed already in many instances; he desired to be unmolested for one month longer, that he may, as he expresses it, "get rid of his supply of specifics" and assured me that in five or six weeks at most he will leave the city and never again subject himself to the law of this state....⁸

All of which is respectfully submitted,

D.W. Reese,
Censor of third ward
City of Baltimore

One wonders what actually became of Doct. A. Martin, the *Indian Doctor*. Did he get his one month reprieve or not? A search of the city directory at the Enoch Pratt Free Library for that year does not reveal any trace of the good doctor, so we may never know for sure what the results of Reese's efforts may have been. One thing we do know is that even with committed doctors like Reese on the Faculty's side, it would be almost another half century before the force of law was again fully on the side of the medical community. This occurred as a result, according to Paul Starr, of a growing change in the approach toward medical education taken in the United States, as well as the Supreme Court decision in *Dent v West Virginia* in 1881.⁹

Today, we can look to such programs as the Faculty's peer review program and the state's Board of Physician Quality Assurance to protect the public when dealing with the medical community. But it is to men like Dr. Reese, censor of the third ward, and his colleagues that we owe our thanks for making it all possible.

Notes

2. Starr, Paul. The Social Transformation of American Medicine. New York: Basic Books, Inc. 1982; 52–57. The Thomsonians were the medical community's first organized competition. Founded in 1800, the group took its name from its founder, Samuel Thomson. Thomson's basic premise was that all disease was caused by an imbalance in the body's temperature. The cause was cold while the cure was heat. Heat was best restored, according to the Thomsonians practice, by the use of an extremely dangerous emetic known as Indian Tobacco. Politically and

Library Page

socially active, the Thomsonians rapidly gained adherents throughout the first several decades of the nineteenth century in both cities and frontier settlements. Eventually, the group members split among themselves over the issues of required medical education and self-regulation, with those in favor of these two improvements soon becoming accepted by the educated, traditional medical community, while those opposed fell by the way-side.

YOCON® YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubiaceae and related trees. Also in *Rauwolfia Serpentina* (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

AMA and the Auxiliary join forces against violence

When 13-year-old Jason came home late Friday night and found his 16-year-old sister Sara and her friends in his room, he pulled out a gun and shot her. Three bullets tore through her face and chest. She died within hours.

Situations like this are not unusual. Last year alone, more than one hundred thousand children faced a brother or sister with a gun or knife in hand, and more than twelve hundred children were murdered by parents, siblings, or other relatives. As shocking as the statistics are, they reflect only a small portion of the population affected by the violence epidemic.

Termed the disease of the 90s, violence is as complex and life-threatening as any of the killer diseases of the past two centuries. It touches as many as one-fourth of all American households, and it often happens between people who know each other—friends, parents, children, and husbands and wives.

According to a recent article in the *Journal of the American Medical Association*, family violence is the single largest cause of injury to women in the United States, more common in fact than automobile accidents, muggings, and rapes combined. As many as 35 percent of women who visit hospital emergency rooms are there for symptoms related to ongoing abuse, yet less than 5 percent of the victims of family violence are identified as such. Conservative estimates put the annual medical costs of family violence at \$44 million—the equivalent of almost one hundred thousand days of hospitalizations, almost thirty thousand emergency department visits, and almost forty thousand visits to a physician each year.

"The prevalence of violence and its consequences on society make it an issue every American should address," says Marshall Rosman, Ph.D., director of the AMA's Department of Mental Health, "particularly those in the medical community, since family violence is a pressing health issue."

To promote medical community involvement in the violence problem, the American Medical Association has launched a nationwide effort to involve physicians in preventing violence and providing help for the victims of child physical and sexual abuse, elder abuse, and spouse abuse. As part of the initiative, the AMA will invite physicians to join the National Coalition of Physicians Against Violence and to work with other concerned groups and individuals to develop

local family violence prevention committees that can set agendas to combat the problem.

Key to the effort will be the AMA Auxiliary. "As physicians around the country join the coalition, we will encourage them to hook up with an auxiliary member in their community," explains Dr. Rosman, coordinator of the national coalition. "Then physicians and auxiliaries can approach state medical societies together to urge them to address the problem and to establish local violence prevention committees."

Local communities will be asked to set an agenda for family violence activities in their communities, which might include such projects as developing a resource book for physicians outlining the organizations and agencies available to aid victims of abuse, or distributing guidelines on child physical and sexual abuse, domestic violence, and elder abuse to physicians and other interested community members.

In addition to aiding the AMA in its activities, the AMA Auxiliary has developed its own program to address the violence problem. Kicked off by 1991–92 AMA Auxiliary President Sherry S. Strebel, the Campaign Against Family Violence encourages state and county medical auxiliaries to develop programs and projects to educate the public about the violence problem and to support the victims of family violence. Auxiliaries are also being urged to work with the AMA to provide physicians with resources.

Several auxiliaries across the country are already addressing the violence problem through such activities as self-esteem and victimization workshops for children and teens; parenting workshops for potentially abusive mothers and fathers; shelters for abused and neglected children and battered women; support groups for violence victims; and crisis centers and hotlines.

"The tragedy of family violence is as much a challenge to the general health and welfare of the nation as it is to the system of justice and law," says Ms. Strebel. "I congratulate those auxiliaries that are already addressing the problem and I urge others to make the commitment and get involved." ■

Cancer prevention

The carcinogenic process proceeds through multiple stages, namely, initiation, promotion, and progression. Such a process may occupy the major part of an individual's lifetime. Initiation may only require a single exposure to a carcinogen that results in deoxyribonucleic acid (DNA) damage. Promotion involves multiple exposures to agents that do not damage DNA directly, but can do so in multiple phases. Progression is the conversion of a benign tumor to a malignant one. Furthermore, progression can be an open-ended process, since growing tumors often continue to increase in their degree of malignancy and heterogeneity.

Tumor promoters do not bind to DNA, but bind to cell membrane receptors that activate key regulatory pathways producing a cascade of events. These events include alterations in the function of membrane-associated ion channel receptors and gene expression that will result in changes in cellular differentiation and proliferation. With such an understanding of initiation and promotion, scientists have begun to look at specific inhibitors or modulators of the cellular regulatory pathways. In the meantime, clinicians and public health professionals need to apply what is known and feasible to the primary prevention of cancer.

Chemoprevention

Chemoprevention is one means of cancer control. The occurrence of the disease can be prevented by the administration of a chemical or biological substance. A fair number of the compounds that can prevent cancer have been demonstrated in the laboratory. These compounds belong to a wide variety of chemical classes having a great diversity of action. Although this might seem to indicate that a variety of approaches can be used for cancer prevention, there are two basic mechanisms by which chemical agents inhibit carcinogenesis: (1) the agent may alter the manner in which the carcinogenesis occurs in the organism prior to exposure or reaction of target cells to carcinogens, and (2) the agent acts later in the cancer cycle by altering the biological properties of cells that already have been subjected to the effects of chemical carcinogens. Examples of such agents with known chemoprevention activity and proposed mechanisms include (1) vitamins C and E, which block the formation and absorption of carcinogenic nitrosamines in the gastrointestinal tract; (2) beta-carotene and vitamin E, which are effective in trapping free radical carcinogens; (3) vitamin A (retinoids) which suppresses the effect of polypeptide hormones that are produced by tumors and are enhancers of cell division; (4) butylated hydroxyanisole (BHA), which induces a number of liver enzymes that catalyze the conjugation of carcinogens, thus increasing carcinogen solubility and excretion in the urine; (5) disulfiram, which decreases liver microsomal cytochrome P450 oxidase activity for conversion of benzopyrene

in cigarette smoke to its active carcinogenic electrophilic form, which binds and distorts DNA.

There are several problems in designing and implementing a human clinical trial to evaluate the effectiveness of a given chemopreventive agent. First, it is important to study the safety and dose of such an agent. For most of the naturally occurring agents, the dose effect may not be known. The side effects and toxicity in healthy individuals must be able to be tolerated, and must be minor enough to allow the study to continue for years or even for a lifetime. Second, once the agent and dose are determined, the selection of a suitable population depends on identification of the high-risk group. Issues to consider in population selection include the stage of carcinogen the agent is expected to inhibit; the specific cancer being studied; the age-specific incidence; and an adequate population size to allow for a sufficient number of subjects to complete the study, thus being able to calculate occurrence rates. It is important that a chemoprevention trial obtain complete follow-up on all participants and maintain a high compliance rate.

Cancer prevention and antiviral therapy

There is an important association between both ribonucleic acid (RNA) retroviruses and DNA viruses, and human cancer. The best example is the association of hepatitis virus and hepatocellular carcinoma (hepatoma). There is now substantial evidence that long and persistent infection with hepatitis B is associated with a high frequency of development of hepatoma in these individuals. Therefore, prevention of hepatitis infection would probably reduce the incidence of hepatoma. The prevention program is based on the use of hepatitis B vaccine. Such vaccine is recommended for populations at high risk (e.g., health care workers, military personnel, drug addicts, male homosexuals, and newborns of carrier mothers).

Other controls

The use of cigarettes, cigars, pipes, chewing tobacco, and snuff is a well-known cause of lung and oropharyngeal cancer. Tobacco use accounts for 30 percent of potentially preventable cancer deaths. The carcinogenic action of tobacco is enhanced synergistically by exposure to other carcinogens or co-carcinogenic substances. Consumption of large amounts of alcohol and concurrent cigarette smoking substantially increase the risk of cancers of the mouth, larynx, and esophagus. Similarly, individuals who smoke and are exposed to asbestos are four to five times more likely to develop lung malignancies than smokers only, and fifty times more likely than individuals not exposed to either agent.

It is estimated that another 30 percent of cancers may be attributed to diet. Extensive fat intake, inadequate dietary

fiber, and low consumption of micronutrients (trace minerals and vitamins) may be associated with high cancer rates of the gastrointestinal tract, as well as the breast, prostate, ovaries, and endometrium.

Occupational exposure to carcinogens is estimated to be responsible for 4-6 percent of cancer deaths in industrial countries (entire population). However, this figure rises to 30 percent for workers in industrial parks and plants. There are recent indications that the interaction of environmental carcinogens with critical cellular constituents may reflect on genetic damage at the level of the DNA or the chromosome.¹

The National Cancer Institute has established cancer control objectives to reduce the US cancer mortality rate by 50 percent by the end of this century. Scientists who have worked on these objectives believe that this reduction can be achieved if cancer control is fully applied on all levels and by all concerned institutions, organizations, and individuals. The following elements of cancer control will lead to this reduction: (1) primary prevention through smoking control, dietary changes, and reduction in occupational exposure to

carcinogens; (2) secondary prevention through screening and early detection, particularly in the areas of cancers of the breast, cervix uterus, and colon; and (3) improved provisions for and the use of state-of-the-art treatment modalities.

Board of Physician Quality Assurance Actions

In the matter of
Mohammed H. Amirgholi, M.D.
before the
Maryland Board of
Physician Quality Assurance

Denial of petition for reinstatement

By final decision dated February 5, 1990, the Board of Physician Quality Assurance (the board) voted to revoke the license of Mohammed Hussein Amirgholi, M.D. (the respondent).

The final decision contained no time period or conditions for petitioning the board for reinstatement of his license. COMAR 10.31.01.12.C states

When an order of revocation or suspension states a time for reinstatement of a license, the accused shall make written request for reinstatement to the commission at the expiration of the stated time. When a time period is not stated on the order, a petition for reinstatement may not be entertained before the expiration of one year after the date of the order.

The board's final decision stated no time period at which the board would consider a petition for reinstatement. Therefore, respondent could not petition for reinstatement of his license prior to February 6, 1991. However, since the time that respondent's license was revoked, respondent sought guidance from the board as to what he could do in order for the board to consider reinstating his license. Therefore, the board, through its settlement conference (the conference), met with respondent and his attorney on Wednesday, December 5, 1990. The settlement conference made recommendations to the board as to what respondent must accomplish in order for the board to consider reinstating his license when respondent is permitted to petition the board.

At its meeting on December 12, 1990, the board considered the settlement conference's recommendation and voted to amend its final decision. The board issued the amended final decision on December 26, 1990. As part of the amended final decision, the board stated that prior to applying for reinstatement, respondent must submit evidence that he had complied with four conditions.

Respondent attempted to apply for reinstatement having informed staff that he had evidence that he had complied with the four conditions precedent for application for reinstatement. The conference met on April 24, 1991 to consider respondent's request. Upon consideration of the information given at the conference and the information submitted to the board, the conference issues the following denial of respondent's petition.

Findings of fact

1. The findings of fact of the board's final decision dated February 5, 1990 are incorporated by reference.
2. The findings of fact of the board's amended final decision of December 26, 1990 are incorporated by reference.

3. The amended final decision contained provisions with which respondent was obliged to comply as conditions precedent to the board's considering reinstating his license with conditions to practice medicine. Specifically
 - a. Respondent has continued in therapy on a regular basis with his therapist. Respondent's therapist must submit a report to the board indicating the progress respondent is making and the number of times respondent sees his therapist from December 5, 1990 to the time of the petition for reinstatement. Respondent must sign a release permitting the therapist to report to the board;
 - b. Respondent has completed all continuing education requirements for three years preceding the time of the petition for reinstatement, such requirements being fifty credits for each year;
 - c. Respondent has continued working in the Washington Free Clinic and the director has submitted a report indicating the nature of respondent's duties and the time respondent gives weekly to the clinic from December 5, 1990 to the time of the petition for reinstatement; and
 - d. Respondent has been evaluated by Edward J. Kowalewski, M.D., professor emeritus, School of Medicine, University of Maryland at Baltimore, Department of Family Medicine (the evaluator). The evaluation would cover an overview of respondent's practice and focus upon respondent's knowledge and practice of otolaryngology. Respondent would bear the expense of this evaluation and must sign releases permitting the board to give the evaluator information to assist in the evaluation, permitting the board to inform the evaluator of the final resolution of this matter, and permitting the evaluator to forward his report to the board. Respondent must comply with all reasonable requests of the evaluator.
4. As to condition 3a the conference found that
 - a. Prior to the conference, respondent had not submitted a report from his therapist.
 - b. At the conference, respondent submitted a letter from his therapist dated April 22, 1991, which did not state the number of times, exactly, that respondent had seen his therapist from December 5, 1990. The report stated that respondent had appointments twice a month. However, the report from the evaluator dated March 15, 1991, indicated on page 3 that respondent had decided to stop his psychiatric therapy.
5. As to condition 3b, the conference found that respondent has complied with condition 3b and completed the continuing education requirements by attending the Johns Hopkins Medical Institutions Grand Rounds and regularly scheduled medical conferences, academic year 1990-1991, and receiving fifty-six AMA Category 1 credit hours.
6. As to condition 3c, the conference found that
 - a. The board received a report dated April 15, 1991, from the medical program director of the Washington Free Clinic which stated that "[Respondent] has served as a volunteer physician at the Washington Free Clinic since April of 1989. We have been very pleased with his dedication and his work. We highly recommend him as a candidate for licensure."
 - b. This letter indicated that respondent had continued working in the Washington Free Clinic;

Board of Physician Quality Assurance Actions

- c. The letter did not indicate the nature of respondent's duties; and
 - d. The letter did not indicate the time respondent gives weekly to the clinic.
7. As to condition 3d, the conference finds that
- a. Respondent has been evaluated by the evaluator. On February 18, 1991, the evaluator and three other physicians met with respondent to perform an evaluation focusing upon respondent's knowledge of otolaryngology. The board received the report on March 27, 1991.
 - b. The goals of the evaluation group were to determine
 - (1) What kind of medicine respondent intended to practice, if his license were reinstated;
 - (2) Respondent's specific knowledge regarding the practice of otolaryngology and allergy;
 - (3) If respondent has increased his knowledge base through continuing medical education since 1984;
 - (4) Respondent's capabilities in an office practice, including management, medical records, attitudes, and behavior, according to today's standards; and
 - (5) If respondent is safe to practice medicine.
 - c. The evaluation group found, *inter alia*, that
 - (1) Respondent does not possess adequate medical knowledge or clinical decision-making skills to allow him to safely practice medicine;
 - (2) Respondent's efforts to pursue remedial education have been inadequate;
 - (3) Respondent lacks the potential for correcting his deficiencies by remedial education; and
 - (4) Respondent should repeat a postgraduate medical residency training program.

Conclusions of law

The board incorporates by reference the conclusions of law contained in its final decision of February 5, 1990 and its amended final decision of December 26, 1990 and further concludes that respondent DID NOT MEET THE CONDITIONS PRECEDENT FOR APPLYING FOR REINSTATEMENT as follows:

- 1. Respondent did not comply with the intent of condition 3a;
- 2. Respondent did not comply with condition 3c; and

CONCLUDED that respondent's license remains REVOKED and that the Board of Physician Quality Assurance's amended final decision of December 26, 1990 remains in effect.

Order

By the settlement conference and ratification of the chairperson of the board, it is hereby this 25th day of September 1991

ORDERED, that respondent's petition for reinstatement of his license is DENIED; and be it further

ORDERED, that the board will not consider respondent's petition for reinstatement of his license until such time as respondent submits evidence in writing with his petition that he complied with the board's amended final decision of December 26, 1990; and be it further

ORDERED, that the board's amended final decision of December 26, 1990, to which respondent agreed and consented, remains in full force and effect; and be it further

ORDERED, that respondent must remediate the deficiencies noted in the evaluation report dated March 15, 1991 and as set forth in the board's amended final decision; and be it further

ORDERED, that this order is considered a public document pursuant to *Md. State Gov't Code Ann.*, §§10-611, *et seq.*

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

■ ■ ■

**In the matter of
Peter J. Krokidas, M.D.
before the
Maryland Board of
Physician Quality Assurance
Final order**

Based on information received by the Board of Physician Quality Assurance of the state of Maryland (the board), the board charged Peter J. Krokidas, M.D. (respondent) under the Maryland Medical Practice Act (the act), *MD Health Occ. Code Ann. Section 14-401 et seq.*

The pertinent provisions of the act are as follows:

Section 14-404 Denials, reprimands, probations, suspensions and revocations — Grounds.

(a) *In general.* — Subject to the hearing provisions of section 14-405 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee

(21) Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state or country or disciplined by any branch of the United States uniformed services or the Veterans' Administration for an act that would be grounds for disciplinary action under this section;

The grounds underlying the charges of this section are that respondent

- (1) Fraudulently or deceptively obtains or attempts to obtain a license for the applicant or licensee or for another;
- (3) Is guilty of immoral or unprofessional conduct in the practice of medicine;
- (4) Is professionally, physically, or mentally incompetent; and
- (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state.

The board notified respondent that if respondent did not request a hearing, the board would issue this final order.

Board of Physician Quality Assurance Actions

Based on clear and convincing evidence, the board, on the affirmative vote of a majority of its full authorized membership considering this case, issues this final order.

Findings of Fact

A. The board finds as follow:

1. At all times relevant to these charges, the respondent was and is licensed to practice medicine in the state of Maryland;
2. The respondent was notified by the board on July 16, 1991 of charges filed against him and that the board could sanction respondent as a result of these charges;
3. The respondent was informed that this final order would be executed thirty days from the respondent's receipt of the board's notification, unless respondent requested a hearing;
4. Respondent received the board's charges and notice of intent to sanction under the Maryland Practice Act on July 25, 1991;
5. Respondent had to request a hearing by August 26, 1991 in order for the board not to execute this final order; and
6. Respondent did not request a hearing by August 26, 1991.

B. The board further finds that

1. At all times relevant to these charges, the respondent was and is licensed to practice medicine in the state of Maryland;
2. Appropriate peer review includes the review of a physician's practice by a licensing or disciplinary authority of another jurisdiction;
3. On June 7, 1989, the Board of Registration in Medicine of the Commonwealth of Massachusetts issued a final decision and order in the matter of Peter J. Krokidas, M.D. with the following findings of fact, conclusions of law, and sanction and order:
 - a. Respondent failed to report to the Board of Registration his termination of hospital privileges at the Providence Hospital;
 - b. Respondent failed to report to the Board of Registration his suspension of his surgical and emergency room privileges at the Ludlow Hospital;
 - c. Respondent's surgical care fell below that of the average qualified practitioner practicing ophthalmology in 1979, when he failed to properly anesthetize a patient undergoing cataract surgery (Patient A);
 - d. Respondent falsely answered a question on his application for renewal of his hospital privileges at Wing Hospital regarding any past disciplinary action taken against him;
 - e. Respondent's treatment of a patient (Patient D) with laser photocoagulation therapy for macular edema caused by trauma fell below the standard of care for the average qualified ophthalmologist practicing in 1984;
 - f. Respondent's actual application of the laser treatment was not consistent with good medical practice in that the respondent did not enter power and wavelength settings, and the resultant scars demonstrated that the power that was used was greater than that normally used;
 - g. Respondent was denied privileges at the Newton-Wellesley

Hospital on the basis of misstatements he made on his application for staff privileges;

- h. Respondent's care of Patients A and D described above was negligent;
 - i. Respondent's care of Patient D was gross negligence which the Board of Registration defined as "very great negligence or the absence of slight diligence, or the want of even scant care;"
 - j. Respondent's practices demonstrated a lack of fitness and capacity to carry on the practice of medicine; and
 - k. Respondent provided false answers to procure his registration certificate;
4. Based upon those facts regarding patient care, the Board of Registration restricted respondent's license to practice medicine as follows:
 - a. Respondent may not engage in outpatient or inpatient surgical care, including but not limited to cataract surgery and laser photocoagulation treatment;
 - b. Respondent shall inform his existing patients, all subsequent patients, and all facilities with which he is affiliated of these restrictions on his practice;
 - c. Respondent's practice shall be under the aforementioned restrictions until respondent obtains a plan for supervision accepted by the board, recertification, or its equivalent in his specialty, and additionally demonstrates by clear and convincing evidence that he has remediated deficiencies of concern to the Board [of Registration of Medicine in the Commonwealth of Massachusetts] in this decision; and
 - d. The restrictions on respondent's practice shall continue until respondent provides evidence that health considerations do not impair his surgical practice;
 5. Providing false answers to procure a medical registration certificate is fraudulently or deceptively obtaining a license;
 6. Failure to report termination or restriction of hospital privileges as required by law is fraudulently or deceptively obtaining a license;
 7. Failure to report termination or restriction of hospital privileges as required by law is unprofessional conduct in the practice of medicine;
 8. Multiple negligent acts in the practice of medicine is practicing in a professionally incompetent manner;
 9. Multiple negligent acts in the practice of medicine is unprofessional conduct in the practice of medicine;
 10. Multiple negligent acts in the practice of medicine is a failure to meet appropriate standards of care;
 11. Committing acts of gross negligence in the practice of medicine is practicing medicine in a professionally incompetent manner;
 12. Committing acts of gross negligence in the practice of medicine is unprofessional conduct in the practice of medicine;
 13. Committing acts of gross negligence in the practice of medicine is a failure to meet appropriate standards of care;
 14. The restriction of respondent's right to practice medicine by the Board of Registration is being disciplined by a licensing or disciplinary authority; and

Board of Physician Quality Assurance Actions

15. The imposition of two fines of \$2,000 upon the respondent by the Board of Registration is being disciplined by a licensing or disciplinary authority.

Conclusions of law

Respondent committed the following prohibited acts:

1. Respondent was

Disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state or country or disciplined by any branch of the United States uniformed services or the Veterans' Administration for an act that would be grounds for disciplinary action under this section, *MD Health Occ. Code Ann.* (Section 14-404 (a) (21));

2. The underlying grounds for this disciplinary action were respondent's actions by which he violated the following sections of *MD Health Occ. Code Ann.* Section 14-404 which authorize the board to discipline a licensee if the licensee

Fraudulently or deceptively obtains or attempts to obtain a license for the applicant or licensee or for another (Section 14-404 (a) (1) (1991));

Is guilty of immoral or unprofessional conduct in the practice of medicine (Section 14-404 (a) (3) (1991));

Is professionally, physically, or mentally incompetent (Section 14-404 (a) (4)); and

Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state (Section 14-404 (a) (22)).

Order

It is this 10th day of September 1991, by an affirmative vote of a majority of the full authorized membership of those members of the board who considered this case,

ORDERED, that respondent's license to practice medicine in the state of Maryland is RESTRICTED; and be it further

ORDERED, that the restrictions upon respondent's license to practice medicine in the state of Maryland are identical to those placed upon his license to practice medicine in the commonwealth of Massachusetts; and be it further

ORDERED, that respondent shall not practice medicine in the state of Maryland until respondent appears before a settlement conference of the board and obtains the approval of the board; and be it further

ORDERED, that this is a final order and as such will be considered a public document pursuant to *MD State Gov't Code Ann.* Section 10-611 *et seq.* (1989 Cum. Supp.).

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Notice of right to appeal

Pursuant to *MD Health Occ. Code Ann.* Section 14-408 (b) (1991) there is a right to take a direct judicial appeal. Any appeal shall be made as provided for in judicial review of a final decision in the Administrative Procedure Act, State Government Article and the B Rules of Maryland Procedure, 1991.

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

■ ■ ■
In the matter of
John J. Shigo, M.D.
before the
Maryland Board of
Physician Quality Assurance

Order terminating probation and reinstating license

By order (Appendix B) dated June 21, 1988, the Commission on Medical Discipline (the commission, predecessor agency to the Board of Physician Quality Assurance) found under the criteria of State Government Article §10-405(b) that it was necessary to order the summary suspension of John J. Shigo, M.D.'s (the respondent) license to practice medicine. By order (Appendix A) dated October 24, 1988, the Board of Physician Quality Assurance (the board) stayed the summary suspension of respondent's license to practice medicine, conditioned upon the respondent complying with conditions of probation (the conditions of probation).

By letter dated December 3, 1990, respondent petitioned the board for termination of probationary status and reinstatement of his license (petition) to practice medicine in Maryland. At its meeting on June 12, 1991, the board, through its case resolution conference (the conference), reviewed respondent's petition. Based upon the board's review of the petition, the board determined that respondent had fulfilled the conditions of probation contained in the October 24, 1988 order.

Findings of fact and conclusions of law

The board concludes, as a matter of law, that respondent has satisfactorily complied with all conditions of probation as set forth in the order of October 24, 1988.

Order

Upon the foregoing findings of fact and conclusions of law, it is this 10th day of September 1991 by a majority vote of the full authorized membership of the board

ORDERED, that effective as of the date of this order, the conditions of probation imposed upon respondent's practice of medicine by the board's 1988 order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED, that respondent's license to practice medicine

Board of Physician Quality Assurance Actions

in the state of Maryland be REINSTATED without any condition or restriction whatsoever; and be it further

ORDERED, that this is a final order and as such is considered a public document pursuant to the Maryland Public Information Article, State Government Article, *Annotated Code of Maryland*, §§10-611 *et seq.*, specifically §10-617(h)(2)(vi).

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Appendix A

In the matter of
John J. Shigo, M.D.
before the
Maryland Board of
Physician Quality Assurance

Findings of fact, conclusions of law, and recommendation

Based on information received regarding the recent hospitalization of John J. Shigo, M.D., (the respondent), the Commission on Medical Discipline (the commission) ordered that the respondent's license to practice medicine in the state of Maryland be summarily suspended. This order of June 21, 1988, further required the surrender of certain documents certifying the respondent's entitlement to practice medicine in Maryland. He was also directed to submit to a psychiatric evaluation conducted by Jonas R. Rapoport, M.D. Finally, the commission ordered that a hearing be held within thirty days of the date upon which the commission received a written request for such a hearing from the respondent. The respondent's request for a hearing was received on July 1, 1988, and a hearing was held on July 14, 1988, in Room L-9 at 201 West Preston Street, Baltimore, Maryland 21201 before a hearing officer of the Office of Administrative Hearings and Appeals. The respondent and his counsel, Nelson Ongelia, Esq., were present. The Board of Physician Quality Assurance (the board) was represented by Alice D. Ike, Esq., assistant attorney general. Dr. Jonas R. Rapoport testified on behalf of the board.

The following exhibits of the board were admitted into the record during the hearing without objection:

Exhibit A. Letter to board from Jonas R. Rapoport, M.D., dated July 12, 1988.

Exhibit B. Psychiatric evaluation of John Shigo, M.D., by Jonas R. Rapoport, M.D., dated July 12, 1988.

Exhibit C. Curriculum vitae, Jonas R. Rapoport, M.D.

Exhibit D. Letter addressed to whom it may concern from Gustave J. Weiland, M.D., dated June 28, 1988.

The following exhibits of the respondent were admitted into the record during the hearing without objection:

Exhibit 1. Letter addressed to whom it may concern from Gustave J. Weiland, M.D., dated June 28, 1988. (This exhibit is the same as exhibit D above).

Exhibit 2. Letter to Dr. Shigo from Alayne M. Connell, dated April 29, 1988.

Exhibit 3. Letter to Dr. Shigo from Jay Corbino, dated April 22, 1987.

Exhibit 4. Letter to Dr. Shigo from D. Freeman Carroll, dated April 22, 1988.

Exhibit 5. Documents extracted from the medical records at Holy Cross Hospital of Silver Spring pertaining to the admission of Dr. Shigo on June 4, 1988 and treatment provided thereafter. These documents include progress notes; patient's discharge instruction record; medication administration records; treatment and/or drug records; nursing progress notes; aftercare-plan discharge record; patient property list; interdisciplinary treatment plan; and patient care plan.

Exhibit 6. Minnesota Multiphasic Personality Inventory clinical report regarding John Shigo, dated March 3, 1988.

The parties stipulated to certain facts together with fourteen exhibits associated therewith. These joint exhibits were admitted into the record during the hearing without objection. Joint exhibit 15 was also stipulated and admitted independently of a specific factual stipulation.

Joint exhibit 1. Nursing data base/systems assessment, dated May 30, 1988.

Joint exhibit 2. History and physical, John J. Shigo, by Pimol Limpuangthip, M.D., dated May 30, 1988.

Joint exhibit 3. Doctors' Hospital of Prince George's County (hereinafter, Prince George's Hospital) admission note, John J. Shigo, dated May 30, 1988.

Joint exhibit 4. Documents from medical records of John J. Shigo, Prince George's Hospital, including progress notes; urinalysis report; toxicology screening report; and urine and blood culture reports, dated June 6 and June 9, 1988.

Joint exhibit 5. Physician's orders, Prince George's Hospital, John J. Shigo, dated June 3, 1988.

Joint exhibit 6. Physician's order, Prince George's Hospital, John J. Shigo, dated June 4, 1988.

Joint exhibits 7 and 8. These were not proffered by the parties. (The numbering sequence of following joint exhibits was not changed in order to keep the exhibit identification consistent with the hearing transcript).

Joint exhibit 9. Medical record, Prince George's Hospital, John Shigo, dated January 21, 1988.

Joint exhibit 10. Progress notes, Prince George's Hospital, John Shigo, dated January 22, 1988.

Joint exhibit 11. Emergency service record, physician signed but not dated.

Joint exhibit 12. Admitting record, Prince George's Hospital, John Shigo, dated January 21, 1988.

Joint exhibit 13. Patient transfer form, Prince George's Hospital to Sheppard Pratt, John Shigo, dated January 26, 1988.

Joint exhibit 14. Discharge summary by Carl H. Keller, M.D., John Shigo, dated January 26, 1988.

Joint exhibit 15. Medical records obtained from Holy Cross Hospital of Silver Spring and Prince George's Hospital in response to subpoenas duces tecum issued by the Commission on Medical Discipline in June, 1988. This exhibit also includes two letters to Margaret T. Anzalone from Gustave J. Weiland, M.D., and James D. Peacock, Esq., dated June 29 and 28, 1988, respectively.

By letter dated August 25, 1988, respondent's attorney was forwarded a copy of the hearing officer's proposed findings of fact,

Board of Physician Quality Assurance Actions

conclusions of law, and recommendation (proposed order). Respondent chose not to except the hearing officer's proposed order. On Wednesday, October 12, 1988, the Board of Physician Quality Assurance (the board) considered the entire record and the hearing officer's proposed decision. By a unanimous vote of the board members considering this case, the board makes the following findings of fact, conclusions of law, and order.¹

Findings of fact

1. Prior to June 21, 1988, the respondent was engaged in the practice of medicine in the state of Maryland.
2. In March, 1986, the respondent's parents were found dead in their home as a result of accidental asphyxiation. (See board exhibit B.)
3. Since graduating from medical school in 1969, the respondent has been married and divorced twice, the latest in 1987. (See board exhibit B.)
4. In 1985, following the respondent's separation from his second wife, considerable and costly litigation ensued regarding a settlement agreement, child support, and related matters. (See board exhibit B.)
5. In or about April 1987, the respondent sought relief from the stress and pressures of domestic strife and litigation by giving up his medical practice of sixteen years and moving to Bernuda for approximately two months. (See board exhibit B.)
6. In or about July 1987, the respondent returned to the Washington metropolitan area and retook the family practice specialty medical board examination. (See board exhibit B.)
7. After taking his specialty board examination, the respondent attended a medical meeting in India with his girlfriend. (See board exhibit B.)
8. The respondent extended his stay in India to avoid the stress of litigation and further argument surrounding his divorce. (See board exhibit B.)
9. In September 1987, the respondent returned to the United States and attended a California meeting of the American Academy of Family Practice. (See board exhibit B.)
10. In October 1987, the respondent visited his daughter in Charleston, South Carolina. (See board exhibit B.)
11. While in Charleston, the respondent was arrested on a fugitive warrant issued in Maryland because of child support arrearage. (See board exhibit B.)
12. Upon his return to Maryland, the respondent was incarcerated for ten days. (See board exhibit B.)
13. When released, the respondent lived in an apartment constructed in a house jointly owned with Mr. J.P. Rickett, C.P.A., respondent's accountant. (See board exhibit B.)
14. Mr. Rickett and the respondent had a business association with regard to the respondent's medical practice in Bowie, Maryland. (See board exhibit B.)
15. The respondent gave Mr. Rickett his general power of attorney under which Mr. Rickett had arranged for other physicians to manage the respondent's medical practice in Bowie while he was away from the Washington metropolitan area. (See board exhibit B.)
16. The respondent did not return to his medical practice in Bowie because it appeared that some patients believed he had deserted them. (See board exhibit B.)
17. The respondent then worked as a physician for Kaiser Permanente in Kensington, Maryland, but left the position after one month because he believed there was inadequate staff support. (See board exhibit B.)
18. At that point, the respondent felt anxious and depressed for a number of reasons. In addition to the recency of his parents' deaths, he had to go back to court for the final settlement of his divorce, he was in arrears on child support, he had given up a sixteen-year medical practice in Bowie, he did not want to go into court without a job, Mr. Rickett indicated he was "washed up" in Bowie and wanted him to take over a practice in Accokeek, and the Internal Revenue Service was investigating the withdrawal of funds from his pension plan.² (See board exhibit B.)
19. On or about January 21, 1988, at around 6:00 p.m., the respondent was found unconscious in his home at 11800 Galaxy Lane, Bowie, Maryland, by a friend. Four syringes were found next to the respondent. (See joint exhibit 9.)
20. The respondent had attempted suicide by injecting significant quantities of Tramxene, Phenergan, and Demerol IV into his body. (See board exhibit B.)
21. On or about January 21, 1988, the respondent was transported via medic unit to Prince George's Hospital. Throughout the transport and upon his admittance to the hospital's emergency room at approximately 10:17 p.m., the respondent remained comatose, exhibited pinpoint pupils bilaterally, and was unresponsive to deep pain stimuli.
22. In connection with the respondent's admission to Prince George's Hospital on or about January 21, 1988, a drug screen was performed from samples of his blood and urine. The drug screen was positive for benzodiazepines and opiates. (See joint exhibit 10.)
23. A physical examination of the respondent upon admission to the hospital on or about January 21, 1988, revealed fresh multiple needle marks on bilateral antecubital fossae with related ecchymosis. (See joint exhibit 11.)
24. Upon respondent's admission to Prince George's Hospital, his medical diagnosis was drug overdose. (See joint exhibit 12.)
25. The respondent remained a patient in Prince George's Hospital until his transfer to the Sheppard Pratt Hospital (hereinafter, Sheppard Pratt) on January 26, 1988.
26. Sheppard Pratt is a private psychiatric hospital located in the state of Maryland.
27. At the time of the respondent's transfer to Sheppard Pratt on January 26, 1988, the patient transfer form listed his diagnoses as an overdose with opiates and benzodiazepines, as well as an adjustment disorder with mixed reaction. (See joint exhibit 13.)
28. Upon the respondent's transfer to Sheppard Pratt, Dr. Carl H. Keller, a psychiatrist on staff at Prince George's Hospital, prepared a discharge summary. The summary reveals that the respondent "...denied making a suicide attempt or that he wanted

1. Prior to the board's considering the record, respondent, through his attorney, agreed to be examined by Jonas R. Rapoport, M.D., and have the board's chairperson, Israel H. Weiner, M.D., report to the board orally regarding Dr. Rapoport's finding. The board considered this information.

2. The respondent alleged that his former wife embezzled about \$150,000 from his pension plan and that he had been providing her with \$3,850 a month for support.

Board of Physician Quality Assurance Actions

- to die" and listed diagnoses of adjustment disorder and depressed mood. (See joint exhibit 14.)
29. While at Sheppard Pratt, Dr. Joseph Chambers of Physicians Rehabilitation contacted the respondent and arranged for his therapy with Dr. Harvey Fernbach. (See board exhibit B.)
30. Upon release from Sheppard Pratt, the respondent began treatment with Dr. Fernbach and also tried to open his own practice in Bowie. (See board exhibit B.)
31. Conflicts arose between the respondent's girlfriend, who was acting as the office manager of the new practice, and Mr. Rickett. This conflict created more stress and anxiety for the respondent. (See board exhibit B.)
32. In the interim, the local medical society required the respondent to see Dr. Richard Anderson, a Baltimore psychiatrist. (See board exhibit B.)
33. Dr. Anderson opined that the respondent's problems related to his relationship with and dependency on Mr. Rickett. (See board exhibit B.)
34. Thus, several major stressors were acting on the respondent at that point: namely, his dependency on Mr. Rickett, who still had control of the respondent's money; the slowness of the buildup of his medical practice; the conflict between his girlfriend and Mr. Rickett; and the girlfriend's threat to leave if the respondent did not cut his ties with Mr. Rickett. The respondent felt he was unable to get everything under control. (See board exhibit B.)
35. On or about May 30, 1988, the respondent went into the garage of a friend he was staying with, started the car, put a blanket on the ground, took twenty-five 25 mg. Phenergan capsules and four 15 mg. Restoril tablets, ran around to quicken absorption of the medicine, and then lay down next to the engine exhaust pipe. He started to choke, ran out of the garage, and fell down on the lawn where his daughter found him. (See board exhibit B.)
36. On May 30, 1988, the respondent was transported via medic unit from his friend's residence at 7000 Highbridge Road, Bowie, Maryland, to the AMI Doctors' Hospital of Prince George's (hereinafter, Doctors' Hospital).
37. On May 30, 1988, at approximately 3:15 a.m. when admitted to Doctors' Hospital, the respondent was comatose. (See joint exhibit 1.)
38. Upon the respondent's admission through the emergency room of Doctors' Hospital, it was revealed that the respondent was previously seen by a psychiatrist and experienced a prior drug overdose. (See joint exhibit 2.)
39. The admission note prepared at the time of the respondent's admission to Doctors' Hospital listed the reasons for admission as an overdose of benzodiazepine and carbon monoxide poisoning. (See joint exhibit 3.)
40. The presence of benzodiazepine was noted in samples of the respondent's blood and urine collected at the time of his admission on May 30, 1988. (See joint exhibit 4.)
41. When the respondent was transferred to a private room at Doctors' Hospital on June 3, 1988, the physicians' orders contained instructions for a twenty-four-hour sitter with the patient, either hospital or agency personnel. (See joint exhibit 5.)
42. Physicians' orders for the respondent's care dated June 4, 1988, contained instructions to continue the twenty-four-hour sitter and suicidal precautions. (See joint exhibit 6.)
43. During his hospitalization, the respondent was referred to Dr. Gustave Weiland, a board certified psychiatrist, who began psychotherapy and continues to see the respondent twice a week. (See board exhibit B.)
44. On or about June 21, 1988, the then Commission on Medical Discipline, summarily suspended the respondent's license to practice medicine in the state of Maryland, ordered that a hearing be held to consider the emergency suspension, and directed the respondent to appear for a psychiatric evaluation by Jonas R. Rapoport, M.D. (See commission's order dated June 21, 1988.)
45. The respondent was interviewed and evaluated by Jonas R. Rapoport, M.D., on July 11, 1988. (See board exhibits A and B.)
46. Dr. Rapoport stated that the respondent suffers from a bipolar disorder with two clear depressive episodes and possible hypomanic episodes. Dr. Rapoport also found that at the time, there was sufficient hypomania and evidence of poor judgment to cause him to believe the respondent should not practice medicine at that time. (See board exhibits A and B.)
47. Dr. Rapoport stated that suspension of the respondent's license on an emergency basis was appropriate and the justifying conditions continue to exist. (See board exhibit B.)
48. Dr. Rapoport expressed his professional opinion that the respondent's license not be returned to him immediately, that he undergo a period of continued treatment, that he attempt to stabilize his life situation and finances before his license is returned, that when the respondent returns to practice he should practice under the supervision of, or in relationship to, other physicians, not as a solo practitioner. (See board exhibit B.)
49. Dr. Rapoport stated further that the respondent must remain under psychiatric care and take appropriate medications for at least another year, if not longer. (See board exhibit B.)
50. Finally, Dr. Rapoport testified that suspension of the respondent's license could be removed in thirty to sixty days from July 14, 1988, provided the respondent's other life situations or stressors have been appropriately reduced or eliminated.
51. The respondent, via counsel, testified that the litigation surrounding his divorce settlement and child support has been finalized.
52. The respondent has removed himself from the prior stressful living situation, had moved to another locale, and has broken his relationship with Mr. Rickett.
53. The respondent has rented and moved into a townhouse in Georgetown and continues with psychiatric care including group therapy. (See board exhibit B.)
54. In his letter of June 28, 1988, Dr. Weiland stated that in his professional judgment, the respondent is well and able to practice medicine without any limitations. (See respondent exhibit 1.)
55. On October 11, 1988, Dr. Rapoport examined respondent and opined that respondent could return to practice in a group setting if respondent continues in the therapeutic relationship with Dr. Weiland.

Conclusions of law

State Government Article §10-405(b), *Annotated Code of Maryland*, provides in pertinent part that a unit [of the state government] may order summarily the suspension of license if the unit

- (1) finds that the public health, safety, or welfare imperatively requires emergency action; and
- (2) promptly give the licensee:
 - (i) written notice of the suspension, the findings, and the reasons that support the findings; and
 - (ii) an opportunity to be heard.

Board of Physician Quality Assurance Actions

Based on the above findings of fact, it is concluded that the public health, safety, and welfare required that respondent's license be summarily suspended.

Order

Based upon the findings of fact and conclusions of law, it is hereby ORDERED this 24th day of October 1988, that the summary suspension of respondent's license to practice medicine is hereby STAYED, subject to respondent's compliance with the following conditions:

1. Respondent shall remain in psychiatric care and comply with all recommendations of his therapist;
2. Respondent shall only practice medicine in conjunction with other licensed physicians in a practice setting approved by the board;
3. The respondent shall arrange for respondent's therapist to submit written monthly reports to a representative of the board commencing one month after the date of this order, indicating that respondent is making satisfactory progress in dealing with the problems that led to his license being summarily suspended, the number of times a month respondent is in therapy, any medications being taken, and whether respondent is complying with all medical recommendations of the therapist;
4. The respondent shall continue in therapy until the therapist certifies to the board's representative in writing that the respondent is discharged;
5. In the event that the respondent terminates therapy prior to discharge by the respondent's therapist, the therapist shall immediately notify the board's representative that respondent has left therapy without consent of the therapist;
6. The board's representative shall prepare for Dr. Rapoport (or a board-approved psychiatrist) to review a summary of the therapist's reports when respondent petitions the board for reinstatement of his license;
7. In the event that the therapist's reports indicate that respondent is not complying with the therapist's recommendations, that respondent has terminated therapy against the advice of his therapist, or that respondent is a danger to himself or the public health, safety, or welfare, the board's representative will report IMMEDIATELY to the board;
8. In the event that the Board's representative does not receive the required reports, due starting on November 30, 1988, and due thereafter on the 30th of the month, until a year has passed from respondent's approved employment commencing, the board's representative will notify the board within five days of failing to receive the report;
9. In the event that respondent moves permanently or temporarily, respondent shall promptly notify the Board of Physician Quality Assurance in writing of respondent's new address and telephone number during the probationary period;
10. The respondent shall practice in accordance with the laws and regulations governing the practice of medicine in Maryland; and be it further

ORDERED, one year from the date the board approves respondent's job description, respondent may petition the board to remove any conditions of his license to practice medicine in Maryland. Prior

to any decision being made by the board on said petition, respondent shall submit to an examination by Jonas R. Rapoport, M.D. or another psychiatrist approved by the board. At that time, if the board determines that a vacating of the suspension would not be appropriate, the board may impose other conditions. If the respondent has complied with all conditions, and if there are no outstanding complaints against respondent's practice, the board will reinstate the respondent's license without any conditions or restrictions whatsoever; and be it further

ORDERED, that respondent's license to practice medicine and his federal and state permits to prescribe controlled dangerous substances and legend drugs are restored, subject to the above conditions; and be it further

ORDERED, that if the board receives a report from respondent's therapist or the board's representative indicating that respondent is a danger to himself or to the public safety, health, or welfare, or if respondent has terminated therapy against the advice of his therapist, the board, WITHOUT PRIOR NOTICE AND AN OPPORTUNITY TO BE HEARD MAY LIFT THE STAY OF SUMMARY SUSPENSION ON RESPONDENT'S LICENSE, provided that respondent is given immediate notice of the charges and an opportunity for a hearing thirty days after requesting same; and be it further

ORDERED, that if respondent violates any other term of this order, the board, after notice and a hearing, and a determination of violation, may lift the stay of SUMMARY SUSPENSION of respondent's license or may impose any other disciplinary sanction it deems appropriate; and be it further

ORDERED, that this is a final order and as such is considered a public document pursuant to State Government Article of the *Annotated Code of Maryland*, §§10-611, *et seq.*

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Appendix B

In the matter of
John J. Shigo, M.D.
before the Commission
on Medical Discipline

Order for emergency suspension of medical license

Based on information received regarding the recent hospitalization of JOHN J. SHIGO (the respondent), the Commission on Medical Discipline (the commission) makes the following findings of fact, conclusion of law, and order.

Findings of fact

Based upon all the information known and available to it, the commission has reason to believe that

1. Respondent is a physician licensed to practice medicine in the state of Maryland.
2. On May 30, 1988, respondent was found unconscious on the grass outside the garage of his residence by his daughter, Monica Shigo. The garage light was on and the car engine was still running inside the garage. No medication was found near respondent or in or around the house.
3. On May 30, 1988, respondent was transported via medic unit from his residence, 11800 Galaxy Lane, Bowie, to the AMI Doctors' Hospital of Prince George's.
4. On May 30, 1988, at approximately 3:15 a.m., when respondent

Board of Physician Quality Assurance Actions

was admitted to AMI Doctors' Hospital of Prince George's through the emergency room, respondent was not conscious. A copy of report noting respondent's status upon admission is attached as exhibit 1.

5. On May 30, 1988, upon respondent's admission through the emergency room of AMI Doctors' Hospital of Prince George's, a past history of psychiatric care and drug overdose using Demerol IV was noted. A copy of the history and physical taken is exhibit 2.
6. On May 30, 1988, upon respondent's admission through the emergency room of AMI Doctors' Hospital of Prince George's, the reasons for admission as listed on the admitting note were (1) overdose of benzodiazepine and (2) carbon monoxide poisoning. A copy of the admitting note signed by Pimol Limpuangthip, M.D. is exhibit 3.
7. On May 30, 1988, upon respondent's admission through the emergency room of AMI Doctors' Hospital of Prince George's, blood and urine samples were taken. Analysis of respondent's blood and urine noted the presence of benzodiazepine. A copy of the relevant reports and notes is exhibit 4.
8. On June 3, 1988, respondent was transferred to a private room at AMI Doctors' Hospital of Prince George's. The physicians' orders dated June 3, 1988 contain instructions for a twenty-four-hour sitter with the patient — hospital or agency personnel. A copy of the June 3, 1988 physicians' orders is exhibit 5.
9. Physicians' orders for respondent's care at AMI Doctors' Hospital of Prince George's dated June 4, 1988 contain instructions to continue twenty-four-hour sitter and suicidal precautions. A copy of the June 4, 1988 physicians' orders is exhibit 6.
10. The facts and circumstances surrounding the events of May 30, 1988, when considered with respondent's age and previous history of attempted suicide by injection of Demerol, support a finding that on May 30, 1988, respondent attempted suicide.
11. Respondent's apparent suicide attempt on May 30, 1988 as described above suggests the existence of a diagnosable illness.

12. Respondent's apparent suicide attempt on May 30, 1988 as described above indicates that respondent either lacks good judgment or that his judgment is impaired, thus placing at risk patients whom respondent may treat.

Conclusion of law

Based upon the foregoing facts, the commission finds that the public health, safety, and welfare imperatively require emergency action in this case, pursuant to State Government Article, §10-405(b), *Annotated Code of Maryland*.

Order

It is this 21st day of June 1988 by the Commission on Medical Discipline

ORDERED, that pursuant to the authority vested in the commission by State Law Article, §10-405 of the *Annotated Code of Maryland*, respondent's license to practice medicine in the state of Maryland is hereby SUMMARILY SUSPENDED; and be it further

ORDERED, that upon presentation of this order, respondent shall immediately deliver to the commission's executive director (1) his diploma-sized certificate from the Board of Medical Examiners, (2) his current Department of Health and Mental Hygiene license renewal certificate, and (3) his current wallet-size license renewal card; and be it further

ORDERED, that a hearing to consider this emergency suspension shall be held before the commission within thirty days of the date upon which the commission receives a written request for such a hearing from the respondent; and be it further

ORDERED, that, in accordance with Section 14-502 of the Health Occupations Article, *Annotated Code of Maryland*, respondent is directed by the Commission on Medical Discipline to appear at the office of Jonas R. Rappeport, M.D., Professional Arts Building, 101 W. Read Street, Baltimore, Maryland 21202 at 1:30 p.m. on Monday, July 11, 1988, for the purpose of a psychiatric evaluation.

OSHA Final Rule on Occupational Exposure to Bloodborne Pathogens

March, 1992

The Occupational Safety and Health Administration (OSHA) final rule on Occupational Exposure to Bloodborne Pathogens was published in the Federal Register, December 6, 1991. This standard, summarized in the OSHA Fact Sheet on the following pages, will affect more than 5.6 million U.S. workers, three-quarters of whom are employed in health care. The regulations specify requirements for employers to protect employees from exposure to bloodborne pathogens including but not limited to hepatitis B virus and human immunodeficiency virus (HIV).

The Occupational Safety and Health Act of 1970 dictated the employer's obligation to provide a safe work place. Historically OSHA has regulated chemical and mechanical hazards. This standard marks the first time that OSHA has adopted a standard for a biological hazard. Maryland Occupational Safety and Health (MOSH), the office charged with interpreting and enforcing OSHA regulations must adopt regulations comparable to the OSHA standard by June 4, 1992. By Maryland law, MOSH regulations cover both private and public sector employers. MOSH has the authority to cite and fine employers who are not in compliance with regulations.

The new standard mandates engineering controls (e.g., sharps disposal containers, self-sheathing needles), work practices, personal protective equipment and employee training which will reduce on-the-job risks for employees exposed to blood and other potentially infectious materials. In addition, the standard requires that employers offer pre-exposure hepatitis B vaccination, at no cost, to all

employees with the potential for occupational exposure.

Until the new regulations go into effect, MOSH will continue to conduct inspections, both as general schedule inspections and as the result of complaints or referrals, to determine the existence of a program to minimize the potential for employee exposure to blood and body fluids.

Copies of the December 6, 1991 Federal Register (Volume 56, Number 235) may be obtained from the United States Government Printing Office, Superintendent of Documents, Washington, D.C. 20402, (202) 523-9667. The Maryland Medical and Chirurgical Society Subcommittee on Immunization and Infectious Disease addressed this issue on February 11, 1992. The Commissioner of Labor and Industry will hold a hearing on whether to adopt for Maryland the Standard as promulgated by OSHA. The tentative date for the hearing is Tuesday, March 31, 1992, at 10:00 a.m. in Hearing Room Number 15, First Floor, 501 St. Paul Place, Baltimore, Maryland. The Commissioner will publish formal notice, together with a definite hearing date, in the Maryland Register. The Commissioner will accept both written comments and testimony. Address written comments to the Commissioner at the address listed above. If you wish to be placed on the hearing agenda, please contact either Doris Wright, secretary to the Board, or Carolyn West, Regulations Coordinator, no later than March 27, 1992, at (410) 333-4184.

Fact Sheet

OSHA Bloodborne Pathogens Final Standard

Summary of Key Provisions

Purpose:

Limits occupational exposure to blood and other potentially infectious materials since any exposure could result in transmission of bloodborne pathogens which could lead to disease or death.

Scope:

Covers all employees who could be "reasonably anticipated", as the result of performing their job duties, to face contact with blood and other potentially infectious materials. OSHA has not attempted to list all occupations where exposures could occur. "Good Samaritan" acts such as assisting a co-worker with a nosebleed would not be considered occupational exposure.

Infectious materials include semen, vaginal secretions, cerebrospinal fluid, synovial fluid, pleural fluid, pericardial fluid, peritoneal fluid, amniotic fluid, saliva in dental procedures, any body fluid visibly contaminated with blood and all body fluids in situations where it is difficult or impossible to differentiate between body fluids. They also include any unfixed tissue or organ other than intact skin from a human (living or dead) and human immunodeficiency virus (HIV) - containing cell or tissue cultures, organ cultures and HIV or hepatitis B (HBV) - containing culture medium or other solutions as well as blood, organs or other tissues from experimental animals infected with HIV or HBV.

Exposure Control Plan:

Requires employers to identify, in writing, tasks and procedures as well as job classifications where occupational exposure to blood occurs--without regard to personal protective clothing and equipment. It must also set forth the schedule for implementing other provisions of the standard and specify the procedure for evaluating circumstances surrounding exposure incidents. The plan must be accessible to employees and available to OSHA. Employers must review and update it at least annually--more often if necessary to accommodate workplace changes.

Methods of Compliance:

Mandates universal precautions (treating body fluids/materials as if infectious) emphasizing engineering and work practice controls. The standard stresses handwashing and requires employers to provide facilities and ensure that employees use them following exposure to blood. It sets forth procedures to minimize needlesticks, minimize splashing and spraying of blood, ensure appropriate packaging of specimens and regulated wastes and to decontaminate equipment or label it as contaminated before shipping to servicing facilities.

Employers must provide, at no cost, and require employees to use appropriate personal protective equipment such as gloves, gowns, masks, mouthpieces and resuscitation bags and must clean, repair and replace these when necessary. Gloves are required for phlebotomy except in volun-

teer blood donation centers, where gloves must be made available to employees who want them.

The standard requires a written schedule for cleaning, identifying the method of decontamination to be used, in addition to cleaning following contact with blood or other potentially infectious materials. It specifies methods for disposing of contaminated sharps and sets forth standards for containers for these items and other regulated waste. Further, the standard includes provisions for handling contaminated laundry to minimize exposures.

HIV and HBV Research Laboratories and Production Facilities:

Calls for these facilities to follow standard microbiological practices and specifies additional practices intended to minimize exposures of employees working with concentrated viruses and reduce the risk of accidental exposure for other employees at the facility. These facilities must include required containment equipment and an autoclave for decontamination of regulated waste and must be constructed to limit risks and enable easy clean up. Additional training and experience requirements apply to workers in these facilities.

Hepatitis B Vaccination:

Requires vaccinations to be made available to all employees who have occupational exposure to blood within 10 working days of assignment, at no cost, at a reasonable time and place, under the supervision of licensed physician/licensed healthcare professional and according to the latest recommendations of the U.S. Public Health Service (USPHS). Prescreening may not be required as a condition of receiving the vaccine. Employees must sign a declination form if they choose

not to be vaccinated, but may later opt to receive the vaccine at no cost to the employee. Should booster doses later be recommended by the USPHS, employees must be offered them.

Post-Exposure Evaluation and Follow-up:

Specifies procedures to be made available to all employees who have had an exposure incident plus any laboratory tests must be conducted by an accredited laboratory at no cost to the employee. Follow-up must include a confidential medical evaluation documenting the circumstances of exposure, identifying and testing the source individual if feasible, testing the exposed employee's blood if he/she consents, post-exposure prophylaxis, counseling and evaluation of reported illnesses. Healthcare professionals must be provided specified information to facilitate the evaluation and their written opinion on the need for hepatitis B vaccination following the exposure. Information such as the employee's ability to receive the hepatitis B vaccine must be supplied to the employer. All diagnoses must remain confidential.

Hazard Communication:

Requires warning labels including the orange or orange-red biohazard symbol affixed to containers of regulated waste, refrigerators and freezers and other containers which are used to store or transport blood or other potentially infectious materials. Red bags or containers may be used instead of labeling. When a facility uses universal precautions in its handling of all specimens, labeling is not required within the facility. Likewise, when all laundry is handled with universal precautions, the laundry need not be labeled. Blood which has been tested and found

free of HIV and HBV and released for clinical use, and regulated waste which has been decontaminated, need not be labeled. Signs must be used to identify restricted areas in HIV and HBV research laboratories and production facilities.

Information and Training:

Mandates training within 90 days of effective date, initially upon assignment and annually--employees who have received appropriate training within the past year need only receive additional training in items not previously covered. Training must include making accessible a copy of the regulatory text of the standard and explanation of its contents, general discussion on bloodborne diseases and their transmission, exposure control plan, engineering and work practice controls, personal protective equipment, hepatitis B vaccine, response to emergencies involving blood, how to handle exposure incidents, the post-exposure evaluation and follow-up program, signs/labels/color-coding. There must be opportunity for questions and answers, and the trainer must be knowledgeable in the subject matter. Laboratory and production facility workers must receive additional specialized initial training.

Recordkeeping:

Calls for medical records to be kept for each employee with occupational exposure for the duration of employment plus 30 years, must be confidential and must include name and social security number; hepatitis B vaccination status (including dates); results of any examinations, medical testing and follow-up procedures; a copy of the healthcare professional written opinion; and a copy of information provided to the healthcare professional.

Training records must be maintained for three years and must include dates, contents of the training program or a summary, trainer's name and qualifications, names and job titles of all persons attending the sessions. Medical records must be made available to the subject employee, anyone with written consent of the employee, OSHA and NIOSH--they are not available to the employer. Disposal of records must be in accord with OSHA's standard covering access to records.

Dates:

Sets effective date 90 days after publication in the Federal Register. Exposure control plan must be completed within 60 days of the effective date. Information and training requirements take effect 90 days following the effective date. And the following other provisions take effect 120 days after the effective date: engineering and work practice controls, personal protective equipment, housekeeping, special provisions covering HIV and HBV research laboratories and production facilities, hepatitis B vaccination and post-exposure evaluation and followup and labels and signs.

Produced by Occupational Safety and Health Administration, December, 1991, adapted by Epidemiology and Disease Control Program.

1992 Leadership Conference

of the
The Pennsylvania Medical Society

April 14-15

Hershey Lodge and Convention
Center, Hershey

Featuring:

- "Can Quality Medicine Survive in a Managed Care Environment?" with panelists Alice Gosfield, Esq.; Neil Schlackman, MD, Medical Director, U.S. Healthcare; Michael A. Hattwick, MD; David B. Nash, MD, Jefferson Medical College;
- "Health Care: Election '92" with *Newsweek's* Eleanor Clift and *The New Republic's* Fred Barnes;
- "Practical Political Involvement for Physicians";
- A workshop for the future leaders of medicine;
- "Coping with KePRO," with Donald Harrop, MD, President, Keystone Peer Review Organization;
- "Practice Parameters," with Robert E. McAfee, MD, Vice Chairman of the AMA Board of Trustees;
- "Liability Reform," with Lucian Leape, MD, Harvard;
- *Pittsburgh Press* political cartoonist Rob Rogers.

Workshops focus on leadership skills, stress management, and quality assurance. Registration is only \$80 for the entire program!

What will you tell her about screening mammography?

Many of your patients will hear about screening mammography through a program launched by the American Cancer Society and the American College of Radiology, and they may come to you with questions. What will you tell them?

We hope you'll encourage them to have a screening mammogram, because that, along with your regular breast examinations and their monthly self examinations, offers the best chance of early detection of breast cancer, a disease which will strike one woman in 10.

If you have questions about breast cancer detection for asymptomatic women, please contact us.

Continuously throughout the year

- Visiting preceptorship in pediatric critical care medicine.** Ongoing five-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: \$600.
- Ophthalmic electrophysiology technician training course.** Ongoing one-week course by appointment. The Wilmer Eye Institute, Baltimore, MD.
- Ophthalmology grand rounds.** Audiovisual continuing education series of case discussions for clinicians; 3-8 topics per conference. Thursdays, 7:30-9:00 a.m. 2 Cat 1 AMA/PRA credits per session. Info: 410-955-5700.
- Neuro-ophthalmology conference.** Held twice per month. Info: 410-955-5700.
- Cornea conference.** Held monthly. Info: 410-955-5700.
- The department of radiology and radiological sciences** offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams, 410-955-3169.
- Visiting physicians.** Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: \$500.
- Johns Hopkins medical grand rounds.** Accredited audiovisual continuing education series of case discussions for clinicians; thirty topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 410-955-3988.
- Microsurgery training at the Johns Hopkins Hospital.** One-week program offered continuously throughout the year. 40 Cat 1 AMA/PRA credits. Info: P. Williams, 410-955-3169.

University of Maryland

For each course, additional information may be obtained by contacting the Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, MD 21201 (410-328-3956) or by calling the phone number listed after a specific program. FAX 410-328-3103.

Subspecialty care in general pediatric practice, at the University Club, UMAB campus, Baltimore, MD. 1 Cat 1 AMA/PRA credit. Fee: \$50. Info: Richard Ringel, M.D., 410-328-6666. **Mar. 4 & May 5**

R. Adams Cowley 14th national trauma symposium, at the Hyatt Regency, Baltimore, MD. Info: Kimberly C.A. Unitas, 410-328-2399. **Mar. 6 – 8**

Laparoscopic surgery: The team approach. 14 Cat 1 AMA/PRA credits. Fee: \$2,500. Info: Pat Rahmiow, 410-321-5481. **Mar. 27 – 28**

Current cancer therapy symposium. Info: Sharon Stenhouse, 410-328-3956. **Apr. 3**

Power and medical ethics: The Ipolitas Benedict Bronushas lecture, at the R.A. Cowley Shock Trauma Conference Center Auditorium. Info: 410-448-2770. **Apr. 10**

Infectious diseases in everyday medicine: Second annual symposium, at the Baltimore Convention Center, Baltimore, MD. 12 Cat 1 AMA/PRA credits. Fee: Before April 1, \$175 physicians, \$50 residents and students; After April 1, \$200 physicians; \$75 residents and students. Info: Eunice Katz, 410-328-7560. **Apr. 23 – 24**

12th annual Abraham H. Finklestein memorial lecture. Info: Bonnie Winters, 410-328-6777. **May 8**

18th annual family medicine review course, in Ocean City, MD. 25 Cat 1 AMA/PRA credits. Fee: \$395. Info: Sharon Stenhouse, 410-328-3956. **June 21 – 26**

Continuously throughout the year

Visiting professor program - A new 1992 directory of speakers and their topics is available to area hospitals and other health care organizations. NO administrative fees are charged for this service. Info: 410-328-3956.

Departmental rounds and conferences - Weekly, hands-on and lecture presentations hosted by the University's clinical departments. Hour-for-hour Cat 1 AMA/PRA credits available. Brochure available.

Pediatric grand rounds - Every Thursday from September to June, except third Thursday, in the R. Adams Cowley Shock Trauma Auditorium. Info: Bonnie Winters, 410-328-6777.

Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201-5585
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

1-800-AMA-3211

Think of it as 9-1-1 for America's health care system.

Today, a number of Americans think the answer to our health care problems is a single-payor, national system.

Thankfully, a number disagree. They think that our current system needs to be reformed. Not replaced. They're your peers in the American Medical Association, who support Health Access America. And they're your patients.

Health Access America comes to the rescue with a plan to improve programs such as Medicare and Medicaid, and to require employer-sponsored health insurance, without sacrificing the strengths of the current system.

So if you number among those who want reform, call for help. Call for the kind of changes that will benefit all Americans. Call 1-800-AMA-3211 for more information on Health Access America.

Health Access America

The AMA proposal to improve access to affordable, quality health care.

American Medical Association

Physicians dedicated to the health of America

Join us in a new kind of partnership ... uniting doctors, lawyers, teachers, parents, and youth against drug and alcohol abuse.

Become part of the Maryland Doctor/Lawyer/Teacher Partnership Against Drugs.

As a doctor, you can use your first-hand knowledge and experience to make a difference in winning the

war against drugs. Become part of a unique initiative in Maryland to bring doctor/lawyer education teams into schools to talk about the medical and legal consequences of drug and alcohol abuse.

**To volunteer or for more details,

at 301-539-0872, 1-800-492-1056.**

Doctor/Lawyer/Teacher Partnership Against Drugs

INTERNIST

Board certified internist seeks board certified/eligible associate for growing general internal medicine practice. Competitive salary, incentive bonus, excellent coverage, paid malpractice, health insurance, and vacation. Beautiful area with excellent schools only 40 minutes from Baltimore. Send CV to Linda Harder, V.P. Marketing, Carroll County General Hospital, 200 Memorial Ave., Westminster, MD 21157.

FAMILY PRACTITIONER

Busy 5-person family practice group seeks board-certified/eligible family practitioner to join their Sykesville office. Competitive salary, incentive bonus; excellent coverage arrangements; paid malpractice, health, disability, and vacation, with partnership potential after two years. All members of the practice are board certified. Beautiful area only 30 minutes from Baltimore. Send CV to Linda Harder, V.P. Marketing, Carroll County General Hospital, 200 Memorial Ave., Westminster, MD 21157.

AMA LOCUM TENENS SERVICE

Increasing numbers of physicians across the country are choosing to work as locum tenens because of the benefits offered through this style of practice—freedom with financial security, professional and personal challenge, adventure, and travel. Many physicians relish the freedom that locum tenens positions allow them. It is an ideal situation for those who enjoy travelling, continually meeting new people, and encountering challenges. They are relieved from the burden of practice management and the responsibilities of owning their own practice. Locum tenens have more time to concentrate on matters of personal interest. For more information on AMA Locum Tenens Service, call 1-800-955-3565.

PHYSICIANS WANTED

Semi-retired or retired physicians for pleasant office practice part-time. Call 547-2686.

PHYSICIANS WANTED

Growing group practice affiliated with the largest HMO in Maryland seeks additional BC/BE physicians in internal medicine, family practice, and pediatrics. Positions available in Baltimore and surrounding metropolitan areas. Reply with CV to Daniel J. Winn, M.D., P.O. Box 13126, Baltimore, MD 21203-3126.

INTENSIVIST

39 yo fellowship-trained, board certified in Critical Care Medicine, FCCM. Eight years Director of Surgical ICU in an academic environment managing Cardiac, Vascular, Multiple Trauma, and other surgery patients. Research, publications, awards. Skilled in all invasive ICU procedures: ventilators, PA catheters, bronchoscopy, hemofiltration, pacing, etc. Seek Directorship of Cardiac Surgical ICU, General Surgical ICU, or mixed medical/surgical ICU. Prefer proximity to a metropolitan area with cultural amenities. Please respond to Box 3.

FULL TIME EMERGENCY PHYSICIAN

Large, urban emergency department seeing 50,000 patients per year in teaching hospital. Excellent salary and benefits.

Classified Advertising

*Med Chi Members:
\$5 per line per insertion*

*Physician Nonmembers:
\$8 per line, minimum \$50 per ad*

Please submit copy seven weeks prior to the first day of the month in which you wish the ad to run. Items must be related to the practice of medicine. Ads placed for the benefit of a hospital or an HMO will be billed at the nonmember rate. Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physician's practice or equipment. Ad cancellations must be received in writing seven weeks prior to the first of the month.

Send box replies or new ad copy to: *MMJ*, 1211 Cathedral St., Baltimore, MD 21201 or FAX 410-547-0915. Invoices are sent after the ad is published.

MEDICAL EQUIPMENT FOR SALE

X-ray machine and film processor (Universal 300 MA/125 KVP); Machidascope (Flexible Nasopharyngo-Laryngoscope ENT-US-25); 2 Atmos L.C. pumps; 3 exam chairs (Relnce Coronet 11-13 Pump w/footrest/adjustable); instrument tables; 2 gooseneck exam lamps; Mayo instrument stand; Surgical light (Floor model-Midmark); Over 100 hand instruments (forceps, clamps, scissors, etc.). A complete list of instruments is available. Please call Nancy O'Donnell at 301-983-8845.

ORTHOPEDIC SURGEONS: BROADEN YOUR EXPERIENCE.

Your time and talent are valuable. They're valuable to the Army Reserve, too. We'll pay you for a small fraction of your time, not only in money, but with big opportunities and challenges you won't find in civilian practice.

- You'll have flexibility in how and when you participate.
- You'll be offered conferences and continuing education.
- You'll have opportunities for military training in areas like Advanced Trauma Life Support, Parachuting, Flight Medicine and Mountaineering.
- You'll work with top, dedicated professionals.
- You'll have the rank and privileges of an Army officer.

If you want more information about the Army Reserve, or if you would like to talk to an Army Reserve physician, our experienced Army Medical Counselors can assist you. Call collect or write:

Major Michael W. Salmons

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation

A live program

Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.

Broadcast across the country

An hour-long program

Call-in format: Physician answers questions from listeners

Sunday Morning Consultation

A pre-taped program

Sunday at 7:30 a.m.

Broadcast on WBAL - AM radio

A half-hour program

Interview format: one-on-one talk with John Stupak

For more information, contact Lori Robinson at 539-0872 (Baltimore area) or at 1-800-492-1056 (toll-free from elsewhere in Maryland).

WHY SHOULD YOU REFER CHILDREN AND ADOLESCENTS WITH SPINA BIFIDA TO CUMBERLAND HOSPITAL?

Cumberland Specializes in Child and Adolescent Care

Each year, some 200 pediatric patients ages 2-22 needing rehabilitation and behavior management are admitted to Cumberland Hospital for Children and Adolescents. While many hospitals provide excellent medical treatment, Cumberland adapts its programs to meet the social and psychological needs of young people.

Treatment is often incorporated into traditional adolescent activities. For example, treatment may include a basketball or volleyball game played in the gymnasium or the swimming pool. Individual mobility goals may be tested and explored during an outing to one of the local parks such as Busch Gardens (amusement park), Jamestown, Yorktown or Williamsburg.

For the young person with spina bifida, there is always a new challenge and a new opportunity to stretch his or her abilities and confidence.

Functional Mobility and Independence

The most visible and often most emotionally charged issue for the young person with spina bifida is mobility. Almost all children with spina bifida wear orthoses, and many use wheelchairs. Ambulatory skills are often achieved late and tend to reach a maximum in the 5- to 8-year-old age group.

With the approach of adolescence, there are increases in weight and height that make ambulation more difficult and less cosmetic.

Difficult decisions must be made regarding the young person's future. Cumberland assists patients and their parents in determining the form of mobility that is most acceptable to them, and help them structure their lives accordingly.

Adolescence is also a time when all young people begin to become independent, and independence for the young person with spina bifida means they take responsibility for their bowel and bladder program and for donning and doffing their braces.

Cumberland evaluates the gross and fine motor skills of the patients as well as their level of intellectual functioning. This information is needed to assist patients and their parents in setting reasonable expectations. Behavior and therapy programs are structured around these expectations.

Cumberland Is A Hospital

Cumberland is licensed by the Commonwealth of Virginia and accredited by the Joint Commission on Accreditation of Healthcare Organizations. It is one of only a few hospitals in the United States where all the physicians on the admitting staff are Board Certified in their specialty.

Cumberland Doesn't Look Like a Hospital

The hospital looks more like a small college with buildings connected by sidewalks, and picnic tables and recreation facilities are disbursed among the facilities. It is common to see young people in small groups talking, studying or listening to music. Throughout the day, they go between the dormitory, cafeteria, rehabilitation, school and other buildings.

Depending on their level of physical abilities and behavior program, the young people are given levels of independence on the campus ranging from strict one-on-one staff supervision to free movement within the immediate environment.

Young People At Cumberland Go To School

One of the most important elements in the life of a young person is school, and at Cumberland patients go to school. Integrated into the hospital campus is Cumberland Academy—a licensed private school. The building includes classrooms, a library, prevocational department and gymnasium.

Course work is obtained from each patient's home school and classes are conducted around treatment and rehabilitation programs.

Cumberland Serves Many Different Young People

Cumberland provides treatment for young people with many types of medical and behavioral problems, and this has proved to be very beneficial for the patients with spina bifida. While there are usually a number of young people in the hospital with spina bifida, there are also patients with brain injury, diabetes, seizure disorders, spinal cord injuries, asthma and other conditions.

The young people quickly develop friendships and learn about the "disabilities and abilities" of the other young people. They leave the hospital with their medical needs treated and better able to cope with problems and challenges they encounter.

Cumberland's Setting

Cumberland is located on the Pamunkey River and is part of 1,200 acres owned by the hospital. There are three large lakes on the property for fishing and boating, and miles of trails.

For more information on Cumberland Hospital or to refer a patient for treatment, please call the information office at 1-800-368-3472.

for Maryland Physicians

© 1990 Medical Mutual Liability Insurance Society of Maryland. All rights reserved.

It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

- Progress in physician rehabilitation** 297
Edson B. Moody, M.D.
- The Physician Rehabilitation Committee of Maryland: The early years** 299
Joseph F. Chambers, M.D.
- A survey of recovering Maryland physicians** 301
Frederick Alpern, M.D.; Catherine E. Correnti, NCAC II; Thomas E. Dolan, NCAC II; Michael C. Lufrio, NCAC II; and Anne Sill, B.S.
In a survey of physicians who had participated in the Maryland Physician Rehabilitation Program, 75 percent of the respondents reported that they were in recovery, with a mean recovery duration of eighty-eight months.
- Hospital-based professional assistance committees: Literature review and guidelines** 305
Robert K. White, M.A.; Robert P. Schwartz, M.D.; David R. McDuff, M.D.; and Peter M. Hartmann, M.D.
This paper presents a review of the current literature on hospital professional assistance committees, a discussion of key issues, and a set of guidelines for the design and operation of these committees. The employee assistance program is suggested as a resource to these committees.
- Patterns of substance use in the medical profession** 311
Patrick H. Hughes, M.D.; Carla Storr, M.P.H.; DeWitt C. Baldwin, Jr., M.D.; Kristine M. Williams, M.U.P.; Scott Conard, M.D.; and David Sheehan, M.D.
National drug use surveys of medical students and resident physicians in 1987 found that medical school was not a time when students began to use drugs, nor was it a time when they engaged in heavy use. Medical students and resident physicians reported lower rates of illicit drug use than their age and gender counterparts. Although males generally were more likely to use substances than females, young male and female physicians resembled one another in their current rates of substance use more than they resembled their gender counterparts in society.
- Relapse and recovery: Five to ten year follow-up study of chemically dependent physicians—The Georgia experience** 315
Karl V. Gallegos, M.D.; Barry H. Lubin, M.D.; Carol Bowers, R.N.C.D.; James W. Blevins, M.D.; G. Douglas Talbott, M.D.; and Philip O. Wilson, M.D.
Of 100 physicians who entered into a continuing care contract during a five-year period with the Impaired Physicians Program of the Medical Association of Georgia, seventy-seven have maintained documentable abstinence from all mood-altering substances. One physician was lost to follow-up. Twenty-two relapsed, eighteen of whom have undergone another treatment for chemical dependence. Only one physician in the relapse group has been involved in a pattern of chronic relapsing behavior.
- The Impaired Physician Program of the Medical Society of the District of Columbia** 321
Donald C. Meek, M.D.
Since its establishment in 1980, 128 physicians have been referred to the Impaired Physician Program of the Medical Society of the District of Columbia, of whom sixty-four have either successfully completed the program or are in stable recovery.

Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

Physician rehabilitation: Is it science?

An unstable nervous system is the fundamental basis on which habitual alcoholic excesses develop. There is the weakness of will, the tendency to over-indulge, the lack of self-control, and when once the narcotic effect of alcohol is felt, the inevitable craving for more cannot be resisted. In these weak individuals there is often the marked self-conceit which deludes them into the belief that they can resist when they wish.

(Alexander Lambert, M.D. In: William Osler, ed. *Modern Medicine* 1907; 1: 57.)

Physician impairment is a popular topic. Everyone wants to read about fallen idols. If the morning paper reports a scandal in polarizing rhetoric or if the Board of Physician Quality Assurance (BPQA) reports its proceedings in legalese, it is tempting to read between the lines. How could someone let that happen? Surely the impairment must result in pain, in shame, and in financial ruin. The someones are colleagues. They have survived the rigors of medical school, have memorized obscure data, have stayed up all night on a hospital ward, and have treated our patients. They are us.

Chronic alcoholism is a condition very difficult to treat and once fully established, the habit is rarely abandoned. The most obstinate cases are those with marked hereditary tendency.

(William Osler, M.D. *The Principles and Practice of Medicine* 1899; 383.)

The articles in this issue concern the remedy for impairment and the prevention of public embarrassment. They also result in a peculiar editorial ambivalence.

On the one hand, the theme is vital, current—the information should be received by all physicians. Rehabilitation might even overtake impairment as a readable topic. The *MMJ* editorial board wants the readers provided with current data.

On the other hand, the same board is skeptical about the scientific procedures described in the papers. Here, in a medical journal, you are reading about some ambitious clinical efforts but the facts, figures, and conclusions are not "hard" data. Some are very soft indeed.

The condition is one which has become so common, and is so much on the increase, that physicians should exercise the utmost caution in prescribing morphia, especially to female patients. Under no circumstances whatever should a patient with neuralgia or sciatica be allowed to use the hypodermic

syringe, and it is even safer not to intrust this dangerous instrument to the hands of a nurse.

(William Osler, M.D. *The Principles and Practice of Medicine* 1899; 386.)

In "Patterns of substance use in the medical profession," Hughes et al present some limited conclusions from a pilot survey in which approximately 40 percent of the participants "returned usable questionnaires."

Meek provides a concise overview of his committee's work in the District of Columbia. He does not try to explain the reasons for the 80 percent success rate.

The article on New Jersey's experience describes similar outcome percentages but goes another step to explain the success rate. Using such concepts as "personal relationship" and "tightening-up of the recovery plan," Reading provides a glimpse of the procedures but no way to grasp the mechanism of action.

Describing Georgia's experience, Gallegos et al give more details on the concept of relapse. The overall success rate is similar to other groups and it is heartening. Attempts to explain treatment failures include "more likely to not believe the disease concept" and "emotional issues that seemed to trigger the relapse behavior." Successes include those who "gladly use their monitoring physician," the use of "re-people-ization," and "spiritual program...an absolutely essential ingredient of recovery."

If it is disturbing that so many of these articles encourage "true belief" in some murky concepts, it should not curb enthusiasm for the honest effort on behalf of rehabilitation.

Perhaps the skepticism will prompt a healthy search for even better, more efficient, more measurable, and more scientific treatments.

In the alcoholic days, I had not been able to answer the question as to why I drank. In this adjustment period, I occasionally asked myself why I did not drink and I was equally unable to answer the question. Conscious decision not to drink was no more a part of this thinking than conscious decision to drink had been a part of the former pattern.

JOHN W. BUCKLEY, M.D.
Towson

The ACCUPRIL Single-Agent CommitmentTM

Parke-Davis is confident that for many of your hypertensive patients ACCUPRIL will achieve the decrease in blood pressure you expect.

If, in your medical judgment, your patient requires a diuretic in addition to ACCUPRIL at any time during ACCUPRIL therapy, Parke-Davis will refund your patient's cost of the diuretic.*†

New!

ONCE-A-DAY‡

ACCUPRIL[®] TM
quinapril HCl tablets 10, 20, 40 mg

* See DOSAGE AND ADMINISTRATION section of prescribing information.

† If, after an adequate trial of ACCUPRIL alone, based on your medical judgment as the prescribing physician, you determine that your patient requires the addition of a diuretic, Parke-Davis will refund to the patient his/her cost for the diuretic prescription less any amount reimbursed or paid for by an HMO, insurance company, or any other plan or program.

For more details, ask your Parke-Davis Representative or call 1-800-955-3077.

‡ In some patients, the antihypertensive effect may diminish toward the end of the once-daily dosing interval. In such patients, an increase in dosage or twice-daily administration may be warranted.

ACCUPRIL is available in 10, 20, and 40 mg tablets. Usual initial starting dosage is 10 mg once daily.

ACCUPRIL is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Please see brief summary of prescribing information on following page.

Spironolactone for the treatment of PMS

I read with great interest the article by Dr. Backerman on premenstrual tension syndrome that appeared in the November 1991 *Maryland Medical Journal*. I certainly concur with Dr. Backerman that benzodiazepines should not be utilized for the treatment of this disorder, due to the potential for the creation of depression, memory loss, and interference with natural sleep, as well as their addictive potential.^{1,2} However, the recommended treatment, Buspirone, has some side effects that should be mentioned. Notably, Buspirone does produce tardive dyskinesia, which may create long-term, if not irreversible, movement of the mouth. Also, Dr. Backerman neglects to mention the use of spironolactone, a drug which I first reported effective almost currently with a report appearing in the English literature.³ In a commentary appearing in *JAMA*, it was reported that spironolactone was the only drug proven efficacious, in double-blind crossover trials, for controlling the symptoms of premenstrual tension syndrome.⁴ However, premenstrual tension syndrome seems to be multifactorial, and there is probably no single pharmacological agent that will treat all of the symptoms of the disorder. However, Dr. Backerman is to be commended for his efforts in delineating the etiology of premenstrual tension syndrome.

The use of Buspirone in treating PMS

I am replying to Dr. Nelson Hendler's letter regarding my recent article on PMS in the *MMJ* (November 1991).

Buspirone was originally given to patients who were precipitously taken off of neuroleptic drugs and developed tardive dyskinesia. It has been shown that the occurrence of tardive dyskinesia is *not* related to Buspirone; in fact, Dr. Vernon Nepe, in his excellent textbook, *Innovative Psychopharmacotherapy*, has postulated that higher doses of Buspirone may be quite useful in the treatment of tardive dyskinesia.

Dr. Hendler's letter also mentions the use of spironolactone in PMS, and I am aware of his work with spironolactone; however, on page 1007 of my article, I acknowledge spironolactone as one more pharmacologic approach to PMS management.

I do agree with Dr. Hendler and many experts in pharmacology, endocrinology, and psychiatry that many approaches have been tried in PMS managements. I still insist that Buspirone is safe and quite effective for the emotional components of PMS, especially anxiety, anger, and hostility.

for patient
information*

ROCHE
ME
MEDICATION
EDUCATION

Your Roche representative offers you access – without expense or obligation – to a comprehensive library of patient information booklets designed to supplement rather than supplant your rapport with your patients.

Each booklet helps you provide...

- Reinforcement of your instructions
- Enhancement of compliance
- Satisfaction with office visits

Your Roche representative will be happy to provide a complete catalog of available booklets and complimentary supplies of those that are applicable to your practice.

The magnificent hoax

Bart Gershen, M.D.

In ancient Greece, cosmologists believed that matter was composed of four fundamental elements: earth, air, fire, and water. This left nothing to explain the nature of one's spiritual self, that God-searching, introspective philosopher within us all (exempting politicians).

Something else was clearly needed to satisfy that meta-physical requirement—the purest form of matter, fashioned from divine material. The cognoscenti selected **ether**, the imaginary material from which the heavens were thought to derive. The Greeks called this divine substance *pempte ousia*. The Romans simply called it *quinta essentia* the 'fifth essence'. And so they delivered to our modern world the **quintessence** of everything perfect.

Early physicians tried to explain illness in a similar manner. They envisioned the human as a receptacle containing four liquid substances (*humors*, Latin meaning moisture or fluid), each of which dictated a pattern of behavior. Balanced properly, the human remained well. However, an imbalance of these liquids led quickly to illness (one would be "out of humor"). There were four such humoral substances: blood, phlegm, yellow bile, and black bile.

An excess of blood would cause a person to be red-faced, warm, passionate, cheerful—in effect, **sanguine** (Latin *sanguineus* 'blood'). A surplus of phlegm resulted in a taciturn, cold, aloof, reserved personality. In short, one would be **phlegmatic**. An excess of yellow bile caused one to be bitter, sarcastic, hostile—in other words, to have a **bilious** personality and to assume a **jaundiced** view of the world. Lastly, a glut of black bile would result in depression, despair, and gloom. One would manifest **melancholy** (Greek *melanos* 'black' + *chole* 'bile').

From the sixteenth through the eighteenth centuries, English comedies often relied heavily on such eccentric caricatures to goad audiences into roars of laughter, prompting critics to call these plays **humorous**.

Something which cannot be called humorous, however, is the issue of scientific fraud. Unfortunately, within the past several years our profession has witnessed several disquieting instances of this behavior. One need only recall the case of John Darsee of Harvard Medical School, whose fabricated experiments resulted in his dismissal, followed by apologetic retractions from his distinguished superiors.

Yet scientific fraud has not been confined to the modern world. The greatest astronomer of ancient times—Claudius Ptolemy—did not make the planetary observations specified in his original data. He appears to have borrowed them entirely from the work of Hipparchus of Rhodes, an earlier astronomer. And instances of apparent deception have been imputed to such scientific luminaries as Galileo Galilei, Gregor Mendel, John Dalton, and Robert Millikan, the American Nobel-prizewinning physicist.

Perhaps the greatest scientific swindle of all time, however, took place at the beginning of this century. It involved a lawyer, anthropologist, and physician whose name may be familiar to you in quite a different context.

In 1856, workers discovered the skeletal remains of a human in the Feldhofer Cave located seven miles east of Düsseldorf, Germany. The skull was smaller than average for an adult, and there were prominent supraorbital ridges and coarse cheek bones. Arguments mushroomed over the nature of this find. Broca believed the anatomy was that of an earlier species of man. Virchow disagreed. But it was finally established that the skeleton was an early specimen of *Homo sapiens*. It was roughly one hundred thousand years old.

The cave itself was located near a stream in the Neander Valley. Therefore, the fossil was called **Neanderthal man**. (German *thal* 'valley'. The word is cognate with our term **dale**. In Czechoslovakia, there is a valley named for St. Joseph, **Joachimsthal**, that had become the location for a mint in the sixteenth century. A coin issued there was known as a **Joachimsthaler**, ultimately shortened to a **thaler**, and finally a **taler**. The Dutch called it a **daler**, and we refer to it as a **dollar**. Today, one needs a valley full of them to buy anything.)

Shortly after the discovery of *Homo sapiens Neanderthalis*, other skeletal finds were made in France, Italy, China, Africa, and on the island of Java. Marie Eugene François Thomas Dubois, a physician and lecturer in anatomy at the University of Amsterdam, was impassioned over the idea that earlier forms of man (**hominids**) might be discovered in caves, gravel beds, and rock strata, awaiting the probing eyes and hands of some fortunate paleontologist. He accordingly journeyed to the East Indies as a military surgeon. Once there, he began his explorations on the island of Sumatra.

In 1890, on the island of Java, Dubois discovered a skull fragment, jaw bone, and thigh. He believed them to represent the missing link between apes and hominids—the ape-man, *Pithecanthropus* (Greek *pithekos* 'ape' + *anthropos* 'man'), much better known to the world as the famous **Java man**. Sometime later, in the Chou-k'ou-tien cave near Beijing, China, several additional skulls, mandibles, and limbs were found that matched those of Java man. These quickly became designated **Peking man**. Soon it became clear that none of these bones represented the postulated ape-man. Rather, they were all remnants of an earlier hominid species, now known as *Homo erectus*.

We come then to the celebrated English hoax—perhaps the greatest scientific fraud ever committed. Near the end of the nineteenth century, a rather obscure country solicitor lived and practiced law in County Sussex, England. He was a quiet and rather unpretentious man whose practice was quite modest and whose reputation was quite unassuming.

However, he did enjoy one rather interesting diversion. He was an amateur geologist and anthropologist, a fossil hunter. In fact, he had discovered the first Mesozoic animal in England, had reported it to the proper scientific societies, and had received appropriate commendation. The lawyer's name was Charles Dawson.

He became friendly with a professional scientist, Arthur Smith Woodward, who headed the Department of Geology and Natural History at the British Museum. Dawson was profoundly convinced that specimens of primitive man would eventually be unearthed in England. (Until that time, none had been found there, although monthly reports of such discoveries poured in from virtually every uncivilized country in the world.) Dawson tried to convince Woodward that England—that paradigm of intellectual excellence, the ground which spawned William Shakespeare and Isaac Newton—must ultimately prove to have been the nest of early man.

In 1898, Dawson became legal steward of Barkham Manor, located in the small village of Piltdown. He discovered a large open gravel pit nearby—just the type which he believed might harbor the elusive skeletal finds he so desperately wished to locate.

In 1908, Dawson and a man named Samuel Allinson Woodhead, the local high school chemistry teacher, began an intensive search of those gravel beds. Dawson was later joined by two Jesuit priests who were also nonprofessional, neophyte paleontologists. (One of these, Father Pierre Teilhard de Chardin, was to attain a measure of international stature for his theological, philosophical, and paleontological theories. He, in fact, was one of those who discovered **Peking man**.)

In July 1912, Dawson disclosed to Arthur Woodward that he had found a very primitive human skull and a mandible that he believed might represent the Holy Grail of anthropologists—the missing ape-man link.

On December 18, 1912 at a meeting of the Geologic Society of London, this electrifying discovery was broadcast to the world. The bones were dark brown in color, mute testimony to their prehistoric age. Arthur Woodward and his associate Frank Barlow immediately began the task of reconstructing the face of this ancient ancestor, the common denominator between us and our nearest mammalian relatives.

Someone suggested that a professional anatomist might be useful in accomplishing this goal. (Woodward was, after all, a geologist, not a biologist.) It was quickly decided that the consummate choice would be the conservator of the Hunterian Museum at the Royal College of Surgeons.

This gentleman was a physician graduate of the University of Aberdeen, previously chairman of the Department of Anatomy at London Hospital, and winner of the esteemed Strotter's Prize for his elegant demonstration of the difference between the ligaments of men and apes. He had written extensively about the anatomy of the human heart with Sir James MacKenzie, and had studied with the famous anatomist Wilhelm His. In 1902, he had written the definitive text,

Human Embryology and Morphology. In addition, he had authored *An Introduction to the Study of Anthropoid Apes* (1897), *Ancient Types of Man* (1911), and *The Antiquity of Man* (1915). From 1914 to 1917, he was president of the Royal Anthropologic Institute, and for twenty-three years had been the editor of *The Journal of Anatomy*. For the coup de grâce, he was a member of the Royal Society, president of the British Association for the Advancement of Science, and in 1921, was knighted by King George V. He was, in short, a reasonable choice to analyze the Dawson specimens and to determine their relationship to men and apes.

His conclusions were reached after exacting and meticulous reconstruction of the mahogany-colored bones. The skull cap was clearly hominoid, the jaw with its worn down teeth, obviously ape-like. Yes, these skeletal fragments did indeed represent the long-pursued common ancestor of apes and men—the dawn man.

They named it *Eoanthropus dawsoni*. (Greek *eos* 'dawn' + *anthropus* 'man'). The history of man had just been reshuffled. A new player had cast the die. And Charles Dawson beamed with satisfaction; it was the culmination of his dream.

Except...except...for the doubts. Even from the beginning, a few soft voices murmured uncertainly. Then, in 1924, Raymond Arthur Dart, a surgeon and anthropologist, discovered the famous Taungs skull that had been blasted out of limestone rock by miners in Africa near a small village at the edge of the Kalahari Desert. He named it *Australopithecus africanus* (Latin *Austral* 'southern' + Greek *pithekos* 'ape'). (The name Taungs comes from the name of the nearest railroad station serving the village.) Unexpectedly, Piltdown man had become chronologically anomalous.

Stronger evidence emerged in 1953 when Kenneth Oakley, a geologist from the British Museum, analyzed the brownish pigment discoloring the Piltdown bones. It was found to be potassium dichromate, a chemical that had been deliberately used to stain the fossil bones in order to make them appear much older than they were.

The final confirmation of the stupendous deception was rendered in 1959. Carbon-14 dating proved that the ages of Piltdown's cranial vault and his jaw were millions of years apart. The jaw was authenticated as that of a fossil orangutan. The skull was that of a modern man, possibly an Aborigine, that had been stolen years before from the British Museum.

Oh, yes. What about the celebrated anatomist, anthropologist, and physician who had declared Piltdown to be legitimate? His name was Arthur Keith and with his student, Martin Flack, had been first to describe the Sinoatrial node of the human heart (*Lancet* 2: 359, 1906), the Node of Keith and Flack.

Had Keith been a party to the magnificent deception? Almost certainly not. The best one can say—without expressing too jaundiced or melancholy a view—is that despite impeccable credentials, Sir Arthur had made a remarkable and rather inexplicable error, one that almost validated the quintessential scientific hoax of the twentieth century. ■

INFORMATION FOR AUTHORS INFO

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201-5585. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references), with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately twenty-five to fifty words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to twenty in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permission: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Page proofs will be mailed to the principal or corresponding author and, if not returned by the specified date, will be considered approved as typeset. ■

IF YOU'RE LOOKING FOR A LUXURY HOME, LOOK FOR ONE THAT'S AFFORDABLE.

RIVER FALLS
Potomac's Family Community.

From a strictly financial aspect, River Falls homes have performed admirably. Through the ups and downs over the past 23 years, they've posted a track record of significant appreciation and lasting durability. Marketability that's a testament to timeless designs, construction by teams of in-house craftsmen, and one of the most beautiful, convenient locations in the Potomac/Bethesda area.

Today, a River Falls home is still an eminently affordable investment and a smart one too. Four-to-six bedrooms start in the \$600's with absolutely no compromise in quality. There's terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go well beyond dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs. Nearby are excellent public and private schools, convenient shopping and easy access to suburban Maryland, downtown D.C., and Northern Virginia.

Where else can you get such a sound investment with such outstanding returns? Take an hour to visit River Falls and see how great your future can be. For you, and for your family.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane. HOURS: 12-5 daily.

PHONE: (301) 299-3700.

Brokers welcome.

GOSNELL INC.
Clarence W. Gosnell, Incorporated

"My grandfather taught my father and my father taught me."

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities

Quality Service to Our Physicians and Patients!

Medical and Chirurgical Faculty of Maryland's 194th Annual Meeting

Annual Meeting

mini-invasion & MEGATREATMENTS

"Mini-invasion and Megatreatments,"

at the

Omni Inner Harbor Hotel

101 West Fayette Street

Baltimore, Maryland

Thursday – Saturday

April 30, May 1 – 2, 1992

This year's meeting focuses on two exciting new medical technologies:

mini-invasion – the use of "scopes" in surgical and non-surgical diagnosis and treatment; and...

megatreatments – massive treatments administered to reverse negative pathology.

Support Our Exhibitors

Exhibits are an integral part of Med Chi's annual meeting and are a valuable adjunct to the scientific program.

By visiting the exhibits before and after your scientific program, you will help ensure that Med Chi continues to receive valuable income that allows us to offer you annual and semiannual meetings.

Med Chi urges you to express your appreciation to exhibitors by visiting their booths and discussing your mutual involvement in patient care.

Exhibits will be open:

Thursday: 12:00 noon to 5:30 p.m.

Friday: 9:00 a.m. to 5:30 p.m.

Saturday: 9:00 a.m. to 12:00 noon

Exhibitor sweepstakes drawings will occur in the exhibit area on:

Thursday: 2:45 p.m.

Friday: 10:45 a.m.

Saturday: 10:45 a.m.

You must be present to win

Continuing Medical Education Credits

The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

The Medical and Chirurgical Faculty of Maryland designates this continuing medical education activity for 36.5 credit hours in Category 1 of the Physician's Recognition Award of the American Medical Association. Physicians attending this year's meeting can earn up to a maximum of 17.5 CME credits.

For questions about continuing medical education credits or any of the scientific sessions call:

Joan Mannion

Director of Continuing Medical Education,
at 1-800-492-1056 or 410-539-0872.

Meeting Overview*

Thursday, April 30, 1992

8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – Council Meeting

9:30 a.m. – House of Delegates Meeting/General Membership Meeting featuring:

Special Guest Speaker

Ron Shapiro, Esq.

9:30 a.m. – Spouse Program

11:00 a.m. – 4:00 p.m. – Auxiliary 43rd Annual Meeting

11:30 – Scientific Session

12:00 noon – 12:30 p.m. – Break – Visit the Exhibits –

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – 2:30 p.m. – Plenary Session

"Health Care Reform"

AMA Trustee Thomas R. Reardon, M.D.

2:30 p.m. – 3:00 p.m. – Break – Visit the Exhibits – Exhibitor Sweepstakes Drawing

3:00 p.m. – 6:00 p.m. – Scientific Sessions

4:15 p.m. – Workshop

"Avoiding Excess Retirement and Estate Taxes: Strategies for the 90s"

Med Chi Agency

6:00 p.m. – 9:30 p.m. – Harbor Cruise aboard the Lady Baltimore (Reservations required – space is limited)

Friday, May 1, 1992

7:00 a.m. – Prayer Breakfast

8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – 4:00 p.m. – Auxiliary 43rd Annual Meeting

8:30 a.m. – 6:00 p.m. – Scientific Sessions

8:30 a.m. – Workshop

"Accreditation for Continuing Medical Education"

10:30 a.m. – Break – Visit the Exhibits –

Exhibitor Sweepstakes Drawing

12:00 noon – Auxiliary Meeting and Auction

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – Mini-Symposium

"Physician Office Labs: Master or Slave?"

4:00 p.m. – Workshop

"Computers in the Medical Office"

7:35 p.m. – Baltimore Orioles vs. Seattle Mariners at the new Oriole Park at Camden Yards (Reservations required – space is limited)

Saturday, May 2, 1992

8:00 a.m. – 12:00 noon – Registration

8:30 a.m. – Mini-Symposium

"Ethics of Dying"

8:30 a.m. – 1:00 p.m. – Scientific Sessions

10:30 a.m. – 11:00 a.m. – Break – Visit the Exhibits – Exhibitor Sweepstakes Drawing

11:00 a.m. – Spouse Program

12:30 p.m. – 1:30 p.m. – Lunch on your own

2:00 p.m. – House of Delegates Meeting

3:00 p.m. – Council Meeting

7:00 p.m. – Presidential Banquet

Honoring Med Chi President J. David Nagel, M.D.
(Reservations required – black tie optional)

at the Omni Inner Harbor Hotel
101 West Fayette Street, Baltimore, Maryland
Thursday – Saturday, April 30, May 1 – 2, 1992

Preliminary Schedule

THURSDAY, APRIL 30, 1992

8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – Council Meeting

9:30 a.m. – House of Delegates Meeting

Special Guest Speaker

"Successful Negotiation and Communication"
Ron Shapiro, Esq.

9:30 a.m. – Spouse Program

"Personal Safety and Self-Defense for the 90s"
presented by Citizens Against Crime

11:00 a.m. – 4:00 p.m. Auxiliary 43rd Annual Meeting

11:30 a.m. – *"Current Guidelines for the Diagnosis and Treatment of Bronchial Asthma"*
Maryland Asthma and Allergy Society
CME Credits: 1.5

12:00 noon – 12:30 p.m. – Break – Visit the Exhibits

12:00 noon – Workshop

"Your Financial Lifecycle: How to Get it, How to Keep it and How to Spend it"
Steven Weisman, C.P.A.
CME Credits: None
(Reservations required for this workshop and luncheon – space is limited.)

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – 2:30 p.m. – Plenary Session

"Health Care Reform"
AMA Trustee Thomas R. Reardon, M.D.

2:30 p.m. – 3:00 p.m. – Break – Visit the Exhibits
Exhibitor Sweepstakes Drawing

3:00 p.m. – Scientific Sessions

"Primary Care Follow-up of the Cancer Patient"
Maryland Academy of Family Physicians
CME Credits: 1.5

"Efficacy vs Expense: Maximizing Drug Therapy Outcomes in Your Patient"
Med Chi Committee on Therapeutic Education
CME Credits: 2

"A Fifteen-Year Overview of Focused Remedial Education: A Look at its Present and Future"

Med Chi Committee on Focused Professional Education
CME Credits: 1

4:00 p.m. – Workshop

"Effective Pension Plan Management"
The Prudent Investor's Workshops
CME Credits: None
(cocktail hour to follow this workshop)

4:15 pm – Workshop

"Avoiding Excess Retirement and Estate Taxes: Strategies for the 90s"
Med Chi Agency
CME Credits: None

4:30 p.m. – Scientific Sessions

"The Breast Implant Controversy"
The John Staige Davis Society of Plastic Surgeons of Maryland
CME Credits: 1
"Endoscopy in Gynecology"
Infertility Associates
CME Credits: 1

6:00 p.m. – 9:30 p.m. – Harbor Cruise aboard the
Lady Baltimore
featuring dinner buffet & dancing
(Reservations required - space is limited)

FRIDAY, MAY 1, 1992

7:00 a.m. – Prayer Breakfast

"The Physician's Responsibility to Notify the Patient: Duty and Morality"
Med Chi Committee on Medicine and Religion
CME Credits: 1

8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – 4:00 p.m. – Auxiliary 43rd Annual Meeting

8:30 a.m. – Scientific Sessions

"Claims Abstracts: Learning From Experience"
Medical Mutual Liability Insurance Society of Maryland
CME Credits: 2
Fee of \$40.00 required for this course. Register at door.
"Innovative Strategies for Risk Management"
American Heart Association – Maryland Chapter
CME Credits: 2

8:30 a.m. – Workshop

"Accreditation for Continuing Medical Education"

Med Chi Continuing Medical Education Review Committee
(invitational workshop for CME directors/staff)
CME Credits: None

9:30 am – Workshop

"Delegated Self Review: A Physician-Oriented Solution to Cost and Quality Problems"

Maryland Foundation for Healthy Policy Research
CME Credits: None

10:30 a.m. – 11:00 a.m. – Break – Visit the Exhibits – Exhibitor Sweepstakes Drawing

11:00 a.m. – Scientific Sessions

"Megatrends in Dermatology"

Maryland Dermatological Society, Inc.
CME Credits: 1.5

"Assessment and Care of the Alcohol-Using Patient"

Med Chi Committee on Alcoholism and Chemical Dependency
CME Credits: 1

"Children and Youths as Performing Artists: Protection of Hearing and Vision"

Med Chi Committee on Medicine and the Performing Arts
CME Credits: 1

"The Battered Women Syndrome – The Hidden Trauma"

Maryland Psychiatric Society Women's Committee in cooperation with the Med Chi Women in Medicine Committee
CME Credits: 2

12:00 noon – Auxiliary Meeting and Auction

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – Mini-Symposium

"Physician Office Labs: Master or Slave?"

Med Chi Ad Hoc Committee on Laboratory Regulations
CME Credits: 2

3:30 p.m. – Workshop

"Computers in the Medical Office"

Med Chi Committee on Computers in Medicine
CME Credits: None

4:00 p.m. – Scientific Sessions

"Caring for the HIV-Positive Patient"

Med Chi Committee on AIDS
CME Credits: 2

"Detection and Office Management of Patients with Eating Disorders"

Governor's Task Force on Eating Disorders
CME Credits: 1

"Physicians and the Media"

Med Chi Public Relations Committee
CME Credits: 1

"Substance Abuse: Physician Attitudes, Beliefs and Practices"

Med Chi Committee on Alcoholism and Chemical Dependency
CME Credits: 1

5:00 p.m. – Scientific Sessions

"Micronutrients and Megavitamins: What's New, What's True"

Med Chi Committee on Mental Health
CME Credits: 1

7:35 p.m. – Baltimore Orioles vs Seattle Mariners – at the new Oriole Park at Camden Yards (Reservations required – space is limited)

SATURDAY, MAY 2, 1992

8:00 a.m. – 12:00 noon – Registration

8:30 a.m. – Mini-Symposium

"Ethics of Dying"

Med Chi Committee on Professional Ethics
CME Credits: 2

8:30 a.m. – Scientific Sessions

"Provocative Radiologic Techniques: Discography, Facet Blocks, and Nerve Blocks"

Maryland Society of Physical Medicine and Rehabilitation and the Maryland Society of Orthopaedic Rehabilitation and Occupational Medical Specialists
CME Credits: 2

"Adjuvant Therapy of Breast Cancer: Prognosis and Perspectives"

Maryland Medical Breast Society
CME Credits: 2

"Therapeutic Gastrointestinal Endoscopy"

Maryland Society of Gastrointestinal Endoscopy
CME Credits: 2

10:30 a.m. – 11:00 a.m. – Break – Visit the Exhibits – Exhibitor Sweepstakes Drawing

11:00 a.m. – Scientific Sessions

"Stereotactic Core Biopsy of Breast Lesions – An Alternative to Surgical Excision"

Diagnostic Breast Center of Cross Keys
CME Credits: 1

"Medical Management in Home Care"

Med Chi Long-Term Care and Geriatrics Committee in cooperation with the American Medical Association
CME Credits: 2

11:00 a.m. – Spouse Program

"Stress in the Medical Marriage"

12:30 p.m. – 1:30 p.m. – Lunch on your own

12:30 p.m. – Small Component Society Caucus

2:00 p.m. – House of Delegates Meeting

3:00 p.m. – Council Meeting

7:00 p.m. – Presidential Banquet

Honoring Med Chi President J. David Nagel, M.D.
(Reservations required – black tie optional)

Note: dates, times, session speakers, and topics in this program are subject to change.

Fun Things To Do

Social Events

Med Chi physicians are invited to participate in a wide variety of social events at this year's meeting. Because space is limited, Med Chi is requiring advance registration for all events. To reserve your space, complete the attached registration form or call Vivian Smith at 410-539-0872 or 1-800-492-1056.

Thursday, April 30

6:00 p.m. – 9:30 p.m. Harbor Cruise aboard the *Lady Baltimore*
Dinner buffet and dancing
(Reservations required – space is limited)

Friday, May 1

7:35 p.m. – Baltimore Orioles and Seattle Mariners at the new Oriole Park at Camden Yards
(Reservations required – space is limited)

Saturday, May 2

7:00 p.m. Presidential Banquet
Honoring Med Chi President J. David Nagel, M.D.
(Reservations required – black tie optional)

For Your Family...Activities In Baltimore

While you attend scientific sessions, your family can visit a wide variety of Baltimore attractions and shops including

Baltimore Zoo	396-7102/366-5466
The Baltimore Museum of Art	396-7100
Edgar Allen Poe House	396-7932
Fort McHenry National Monument and Historic Shrine	962-4299
Harborplace and The Gallery	332-1491
Lexington Market	685-6169
Maryland Science Center	685-5225
National Aquarium in Baltimore	576-3810
Shot Tower	837-5424
U.S. Frigate Constellation	537-1979
Walters Art Gallery	547-9000
World Trade Center – Top of the World	837-4515

A more complete listing of family activities and dining opportunities will be available at the annual meeting.

Hotel Reservations

The Omni Inner Harbor Hotel is the largest hotel in Maryland and offers luxurious guest accommodations.

Med Chi has reserved a limited number of rooms at a special group rate of \$105.00 plus tax for single/double rooms with a \$16 plus tax charge for each additional person. Children under age 15 stay free.

To receive this special discounted room rate, you must make your hotel reservations by **March 29, 1992**.

To make a reservation call: 1-800-THE-OMNI (1-800-843-6664)

Guest check-in time is 3:00 p.m. and check-out time is 12:00 noon.

Telephone Messages

During the meeting, messages may be relayed to registrants by calling 1-410-752-1100.

Directions to the Omni Inner Harbor Hotel

101 West Fayette Street

Baltimore, Maryland 752-1100

- 95 South – Through Fort McHenry Tunnel to 395 North (Exit 53). Follow 395 North 1/2 mile to Pratt Street, turn right. Go two blocks and turn left onto Charles Street. Go four blocks and turn left onto Fayette Street. The Omni is one block ahead on the left.
- 83 South – Take (Exit 23) off 695 to get on I-83 South. Go to end of expressway. Turn right at first traffic light, which is Fayette Street. The Omni is seven blocks on the left.
- 95 North – Take exit 53, which is 395 North. Follow 395 1/2 mile to Pratt Street, turn right. Go two blocks to Charles Street and turn left. Go four blocks to Fayette Street and turn left. The Omni is one block ahead on the left.
- BWI Parkway – North (295)- 295 North becomes Russell Street near Baltimore. From Russell Street, turn right onto Pratt Street. Go five blocks and turn left onto Charles Street. Go four blocks and turn left onto Fayette Street. The Omni is one block ahead on the left.
- 70 East – Follow 70 East to 40 East (Edmondson Avenue). Edmondson Avenue becomes Mulberry Street. Follow Mulberry to St. Paul Street and make a right. Go three blocks to Fayette Street and turn right. The Omni is two blocks ahead on the left.
- 40 West – 40 West becomes (Pulaski Highway) Orleans Street in Baltimore. Turn left at St. Paul Street. Go four blocks to Fayette Street and turn right. The Omni is two blocks ahead on left.

Hotel Information

Parking

The following parking locations are within walking distance of the Omni Inner Harbor Hotel. For your convenience, parking lot locations and prices are listed below.

Valet Parking at the Omni Inner Harbor Hotel

Rates:

\$11.00 per 24-hour period
unlimited in/out privileges

Self Park

Alright Parking

Located at the Omni Inner Harbor Hotel - Because this garage is not owned by the hotel, parking spaces cannot be reserved or guaranteed.

Hourly Rates or:

\$7.00 - 2 - 10 hours
\$9.00 - 10 - 24 hours

Down Under Parking

Rates :

\$8.25 - For any parking over 3 hours
\$3.25 - Flat rate on Saturday & Sunday

Arrow Parking

Hourly Rates or:

\$6.00 - In by 9:30, out by 7:30 p.m.

1st Maryland Garage

Hourly Rates or:

\$9.00 - Maximum for day
\$4.00 - Flat rate on Saturday & Sunday

Park and Lock

Hourly Rates or:

\$9.00 - 3 - 24 hours
\$4.00 - Flat rate on Saturday & Sunday

Fayette West Lot

Hourly Rates or:

\$9.00 - 3 - 24 hours
\$4.00 - Flat rate on Saturday & Sunday

Executive Director's Newsletter

April 1992

Preliminary Program for
1992 Med Chi Annual Meeting

Preliminary Program for 1992 Med Chi Annual Meeting

Preceding this newsletter is the preliminary program for Med Chi's 1992 Annual Meeting, "Mini-invasion and Megatreatments," to be held Thursday, Friday, and Saturday, April 30, May 1 and 2, 1992 at the Omni Inner Harbor Hotel.

Physicians interested in attending this year's meeting are encouraged to complete the registration form on the preliminary program preceding this newsletter. For more information about the meeting contact Vivian Smith at 410-539-0872 or 1-800-492-1056.

Social Events for 1992 Annual Meeting

Med Chi has received a number of calls from physicians wishing to reserve tickets for the Harbor Cruise aboard the Lady Baltimore on Thursday, April 30, 1992 and the Orioles baseball game on Friday, May 1, 1992. Because space is limited for both events, Med Chi has closed advance registration for the Harbor Cruise and the Orioles game. In the event that more tickets become available, Med Chi is maintaining a waiting list for physicians who want to attend either the cruise or the baseball game. Any available tickets will be made available to physicians on the waiting list during the meeting. If you would like to have your name included on the waiting list, contact Vivian Smith in Med Chi's Public Relations Department at 410-539-0872 or 1-800-492-1056.

Form 1099

Many physicians have communicated with the Maryland Medical Assistance Program, Department of Health and Mental Hygiene, relative to changing the 1099 to reflect their group number as opposed to their individual provider number. If the physician billed the Program and accepted payment under his/her individual provider number, the Maryland Medical Assistance Program wishes to inform these physicians that the 1099 cannot be reissued to the group practice number. The Program cannot change 1099s unless an error was made by the Program.

Requests for Claim Reviews Maryland Blue Cross/Blue Shield

Usually, claim reviews require additional information and therefore, the request for review should be done in writing. In order to ensure quick processing of your inquiry

- Use the Information Request Form (IRF).
- Attach a copy of the claim in question.
- Include documentation (medical records, op notes, etc.) that will help to substantiate your request for review.
- Do not send a second inquiry until the carrier has responded to the first inquiry.

There are times when a telephone inquiry is appropriate to request review of a claim. Listed below are the most frequently requested changes and how they must be handled:

Telephone Request Accepted
Date of Injury (if omitted on claim)
Patient's Birthdate (birth year change)
Date of Service (year change only)
Place of Service Code
Patient's Name

Written Documentation Required
Date of Injury (if changing)
Patient Birthdate (entire birthdate)
Date of Service (entire date changing)
Date of Service (Vision Claims)
Frequency of Service
Charges
Diagnosis
Procedure Code
Anesthesia Time

*Provider
Payment/Denial
Appeal Process
Maryland Blue
Cross/Blue Shield*

If you disagree with a claim determination and need to have it reviewed, there are three steps to follow. They are

Step 1. CONTACT THE PROVIDER INQUIRY SERVICE DEPARTMENT

By Phone -

If the payment/denial error is obvious and easy to explain, such as an omitted charge or a charge was listed incorrectly, the claim review may be requested by calling the Provider Assistance and Relations Account Team Number. (See below.)

Account Team Name	Team Code	Name of Acct. Exec.	Local Number	800 Number
INSTITUTIONAL				
Central Maryland	A	Sharon Pettaway	581-3540	800-872-4025

In Writing -

If a corrected claim, operative notes, pathology reports are necessary, please send these items to: Par Correspondence, P.O. Box 811, Owings Mills, MD 21117. Include any information that will help explain the situation. Requests for claim reviews must be received within 60 days from the date of the provider voucher.

Step 2. MEDICAL REVIEW

If a provider wishes to appeal the determination resulting from Step 1, a written request should be made for the claim to be reviewed by the Medical Review department. (Send request to: Par Correspondence, P.O. Box 811, Owings Mills, MD 21117.) Again, pertinent claim information, such as operative notes, pathology reports, photographs for certain plastic surgeries, should accompany the request for the claim review.

Step 3. REFERENCE AND APPEALS COMMITTEE

If a provider wishes to appeal the determination resulting from Step 2, a written request should be made for the claim to be reviewed by the Reference and Appeals Committee. (Send request to: Par Correspondence, P.O. Box 811, Owings Mills, MD 21117.)

*Physician/Population
Ratio Improves*

The physician-to-population ratio increased dramatically between 1980 and 1990, according to the 1992 edition of *Physician Characteristics and Distribution in the United States*. There were 237 physicians for every 100,000 civilians in the U.S. population, a 21.5 percent increase during the last 10 years. Other findings reported in the book:

- The total number of physicians in 1990 was 615,421—an increase of 11.3 percent since 1985 and 31.6 percent since 1980.

- There were 360,995 physicians in office-based practice, a gain of 32.7 percent over the past decade.
- The top three specialties were internal medicine, general practice/family medicine, and pediatrics. The three specialties represented 209,772 (34.1 percent) physicians.
- Some 39.6 percent of U.S. physicians were involved in primary care specialties, a proportion that has held relatively steady since 1980.
- Almost six out of every ten physicians (58.2 percent) in the United States were board-certified, an increase of 50.4 percent over the past 10 years.
- The number of female physicians increased at a rate that was almost four times greater than the rate for male physicians: 91.9 percent versus 23.7 percent respectively from 1980-1990.
- More than half of the physicians in the United States (51.9 percent) were 44 years of age or younger.
- The number of group practices has increased by 54.0 percent from 10,762 in 1980 to 16,579 in 1988.

(*This Week*, February 10, 1992, Volume 2, Number 5.)

Visit Codes

The Health Care Financing Administration (HCFA) has decided to extend the filing deadline for visit codes one additional month. Therefore, carriers are to accept and pay assigned and unassigned claims for the 1991 visit codes at the 1991 payment amounts for claims with January 1 through February 29, 1992 dates of service if the claims are received by April 30, 1992.

HCFA 1500 Billing Form

Medicaid will be ready to accept direct Medicaid billings on the new HCFA 1500 billing form by May 1st. Medicaid will accept crossover HCFA 1500 forms *as soon as they are received from Blue Shield of Maryland*.

Crossover Claims to Medicaid

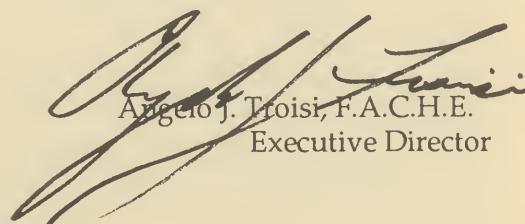

Because of numerous inquiries from physicians, Med Chi requested that the Health Care Financing Administration (HCFA) investigate the problem of claims crossing over from Medicare to Medicaid. As a result of a joint investigation by the State and Blue Shield of Maryland, it was determined that crossover did not occur for the following processing days: October 9, 22, 28-31; November 1, 4-8, 21, 27; or December 12, 20, 1991 or January 6, 8, 17, 1992. Please alert your billing staff about these dates.

Med Chi Semiannual Meeting

Mark your calendars! Med Chi's Semiannual Meeting will be held Friday, Saturday, and Sunday, September 18, 19, and 20, 1992 at the Princess Royale Hotel in Ocean City, Maryland. For more information about the Semiannual meeting, watch the Executive Director's Newsletter.

New CPT Evaluation and Management Codes for 1992

In a continuing effort to keep you apprised of the latest developments in CPT evaluation and management codes for 1992, Med Chi will be providing a listing of commonly asked questions and answers following this newsletter. This list was prepared by the Health Care Financing Administration. Watch the EDN for additional questions and answers about CPT codes in the coming months.

Angelo J. Troisi, F.A.C.H.E.
Executive Director

New CPT Evaluation and Management Codes for 1992

Questions and Answers

(These questions are part of an ongoing listing of commonly asked questions about CPT Codes.
To review the first ten questions, see the March 1992 Executive Director's Newsletter)

11. If a patient is admitted as an inpatient and discharged on the same day, may the hospital discharge day management code be reported?

No. To report services to a patient who is admitted as an inpatient and discharged on the same day, use only the appropriate code for initial hospital inpatient services—Codes 99221-99223.

12. May a physician report an emergency department visit or an office visit and a comprehensive nursing facility assessment on the same day?

No. Evaluation and management services on the same date provided in sites other than the nursing facility are "rolled-up" into the initial nursing facility care code when performed on the same date as the nursing facility admission. For a complete explanation, see page 33 of the 1992 CPT book.

13. Similar to the above, may a physician report a nursing facility visit and an initial hospital visit on the same day?

No. Both of these visits are "rolled-up" into the initial hospital visit. Hospital visit descriptors include the phrase "per day" meaning they include all care for the day. For a complete explanation, see page 18 of the 1992 CPT book.

14. May a critical care code and other procedure codes be reported on the same day? Will Medicare pay for both services?

The critical care codes are intended to include all critical care services performed during the critical period that require the constant attention of the physician (e.g., cardiac arrest, shock, bleeding, respiratory failure, postoperative complications, critically ill neonate). Critical care is usually, but not always, given in a critical care area, such as the coronary care unit, intensive care unit, respiratory care unit, or the emergency care facility. Other procedures that are not directly attendant to critical care management (e.g., setting of fractures, bladder tap) are not included in the critical care code and should be reported separately. See page 31 of the 1992 CPT book for further information.

Medicare will pay for all services that are medically necessary.

15. If a physician provides critical care for 1 hour and 15 minutes, how should the services be reported? Should code 99292 (for an additional 30 minutes) be reported? Should the reduced services modifier be used?

For the first hour of critical care, code 99291 should be reported and no modifier should be used. For the additional 15 minutes, code 99292 should be reported using modifier "-52" for reduced services.

16. Will Medicare pay for both a critical care service and an emergency department service on the same date for the same patient?

The answer depends on the circumstances. If critical care is required (codes 99291 and 99292) upon presentation to the emergency department, no other evaluation and management codes will be paid for by Medicare.

The answer would be different in the following example. A patient presented in the emergency department with mild chest pain. After evaluating the patient, a decision was made to release him. However, just prior to his departure he suffered a cardiac arrest. Medicare would pay for both the emergency department services and the subsequent critical care services.

17. Will Medicare pay for both a hospital visit and critical care on the same day for the same patient?

Possibly. For example, if there is a visit early in the day and at that time the patient does not require critical care, but the patient requires critical care later in the day, Medicare will pay for both services.

18. May a physician report two hospital visits on the same day to the same patient for unrelated problems?

No. The inpatient hospital visit descriptors contain the phrase "per day" meaning all services provided on that day. The code selected should reflect all services provided for the day.

19. May a physician report two office visits on the same day to the same patient for unrelated problems?

Yes. In the office or outpatient setting, two office visits may be reported.

20. Following a consultation, the consulting physician assumes responsibility for the patient's care. How should the services be reported? What will Medicare pay for?

The initial consultation should be reported using the appropriate consultation code. Medicare payment would be made for that code. If the consulting physician then assumes responsibility for the patient's care, subsequent visits should be reported as established patient office visits or subsequent hospital care, depending on the setting.

Progress in physician rehabilitation

Edson B. Moody, M.D.

Dr. Moody is an internist in Washington County and a member of Med Chi's Physician Rehabilitation Committee.

This issue of the *Maryland Medical Journal* has been made available to the Physician Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland in order to present several important aspects in the recovery of the impaired physician. The emphasis is not just on intervention and rehabilitation, but on how successful long-term physician recovery can be.

The paper by Patrick Hughes et al takes an insightful view into the problem of substance abuse by medical students and residents. The papers from Edward Reading in New Jersey, Donald Meek in Washington, DC, Karl Gallegos et al in Georgia, and Fred Alpern et al in Maryland, all deal with long-term physician recovery and outcomes. Robert White et al present guidelines for physician assistance committees in individual hospitals.

Those of us involved in physician rehabilitation have been concerned about how successful we are at what we do. Are we making a difference? How well are we doing? And, what is it that makes a program successful? The answers from these articles is a resounding yes—we can help turn around lives (both personal and professional) and with ongoing care and follow-up, we are doing it well. These reports give success rates ranging from 75 percent to 97 percent, which are excellent given the high failure rates seen before the establishment of physician rehabilitation committees. All of the programs reviewed here stress the absolute necessity of continued involvement by the rehabilitated physician in recovery programs such as Alcoholics Anonymous and Narcotics Anonymous. Detoxification and an inpatient or outpatient care program of intensive rehabilitation therapy are only the beginning. Alcohol and other substance abuse are chronic diseases, and must be addressed as such by the treating physicians as well as the physician recovering from impairment. There is no place for Band-Aid therapy. These papers are excellent testimony to this concept.

It has been my privilege and pleasure to assist in gathering the various articles presented here. After my initial conversation with the various authors, I had the feeling that the data were out there waiting to be gathered, analyzed, and put down in writing. I am pleased to have had a part, not only in the selection of the authors and the topics, but also in encouraging the authors and researchers to complete their tasks. ■

COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital/Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.

The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families. The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (301)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (301)727-1020.

HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. If you wish to help further the work of the Committee through a tax deductible donation send your check to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1204 Maryland Avenue, Baltimore, Maryland 21201 Please note on your donation: "Physician Rehab"

**Physician
Rehabilitation
Committee**

The Physician Rehabilitation Committee of Maryland: The early years

Joseph F. Chambers, M.D.

Dr. Chambers is a psychiatrist in Montgomery County specializing in addictionology and was one of the members of Med Chi's first physician rehabilitation committee.

The Physician Rehabilitation Committee was formed at the 1977 summer meeting in Bermuda of the Medical and Chirurgical Faculty of Maryland (Med Chi). The planners included Drs. Joseph Berman, Maxwell Weisman, Charles Bagley, and James Davis. The first chairperson was Jerome J. Collier, M.D., an internist from Pikesville. He was a former chairperson of the Commission on Medical Discipline and could no longer accept sick physicians losing their medical licenses in Maryland. The committee was established at the direction of the executive council of Med Chi. The committee first met on October 10, 1977, under Dr. James Davis, the 1977–1978 president of Med Chi.

In the first year (The Class of '78), the committee dealt with thirty-five physicians with an average age of 53 years. These were primarily older general practitioners who often had physical problems. Many required detoxification and rehabilitation. Several died of their active disease, some retired, and a few left the state of Maryland. Still, most did recover.

Under Dr. Collier's energetic direction, physician therapy groups began in Baltimore, in Bethesda, and on the Eastern Shore. Enthusiastic physicians formed teams of two or three in the early years. The teams traveled from Oakland in Garrett County to Chrisfield in Somerset County to see their troubled colleagues. These doctors were Robert McDermott, William Dixon, Leo Hennigan, Timothy Barilla, John Griswold, Robert Kent, Patrick Adams, Edson Moody, Edward Kitlowski, Michael Bisco, Michael Hayes, Richard Anderson, Irving Cohen, Robert McDaniel, and Martin Valaske. They all devoted many hours, some, hundreds of hours, to their fellow physicians' recovery. Sister Mary Thomas was a constant support to all the members of the committee.

In a few years, the treatment contracts were organized and procedures and guidelines were established. All the while, Constance Townsend, assistant to Med Chi's executive director, provided continued support for the committee and kept things together. The executive council supported the committee, the county medical societies invited the committee in, and the auxiliary had a representative. From 1977 to 1985, the Physician Rehabilitation Committee made a difference in the lives of over 200 physicians.

Personally, those early years with the committee were the most productive and rewarding of my professional life. They were often difficult and frustrating, but always worthwhile. I am grateful for the honor and the privilege to have had a piece of the action in the recovery of my fellow physicians. ■

YOCON® YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubiaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

A survey of recovering Maryland physicians

Frederick Alpern, M.D.; Catherine E. Correnti, NCAC II;
Thomas E. Dolan, NCAC II; Michael C. Llufrio, NCAC II;
and Anne Sill, B.S.

In a survey of physicians who had participated in the Maryland Physician Rehabilitation Program, 75 percent of the respondents reported that they were in recovery, with a mean recovery duration of eighty-eight months.

Dr. Alpern is a psychiatrist in private practice and a member of Med Chi's Physician Rehabilitation Committee; Ms. Correnti is a nationally certified addiction counselor and the physician rehabilitation advocate for Med Chi's Physician Rehabilitation Program; Mr. Dolan is a nationally certified addiction counselor and the outreach coordinator for Med Chi's Physician Rehabilitation Program; Mr. Llufrio is a nationally certified addiction counselor and the director of Med Chi's Physician Rehabilitation Program; and Ms. Sill is a data manager and analyst for the University of Maryland Division of Human Genetics, and a consultant for Med Chi's Physician Rehabilitation Program.

Since the publication of "Prognosis of physicians treated for alcoholism and drug dependence,"¹ a greater than 83 percent success rate for chemical dependency recovery has been reported for physicians. This figure has been regarded with a great deal of skepticism in the treatment community. The skepticism is understandable when the physician recovery rate is compared with the general population's much lower success rate of 47 percent.¹

To contrast results in Maryland with recovery data cited in the literature for physicians and the general population, the Maryland Physician Rehabilitation Program (PRP) conducted a survey to examine the quality of recovery for physicians who graduated from the PRP. (The PRP is guided by the Physician Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland, which was established in 1978. Its purpose is to receive referrals of allegedly impaired or, in many cases, "wounded" physicians. Referrals come from a plethora of sources including self-reports and reports from families, colleagues, hospitals, office staff, friends, and the Maryland Board of Physician Quality Assurance.) Ninety-two physicians responded to a one-time mailed survey, with seventy-eight of the respondents providing sufficient information for data analysis.

In addition to overall recovery rates, the quality of recovery was measured by rating physician participants' perceptions about the quality of their life prior to and subsequent to PRP involvement, as well as their current functional capacities.

Demographics

Distribution of age, sex, and race for respondents was as follows.

Mean age	54 (Age range: 32–78 years)
Male	80 percent
Female	20 percent
White	74 percent
Asian	11 percent
African-American	8 percent
Hispanic	4 percent
Oriental	3 percent

Medical practice

Eighty-eight percent of survey respondents reported that they were still practicing physicians. Of the 12 percent who reported that they were no longer practicing, 80 percent had retired. Of those who reported retirement, the mean age was 67.2 years. Twenty percent of those no longer practicing indicated that they were not practicing for other unidentified reasons.

Respondents' primary and secondary medical specialties are reported in Table 1. Respondents' impairments included alcoholism, 67 percent; narcotics abuse (Hycodan, percodan, Demerol, codeine, fentanyl, morphine, opiates, oxycodone, meperidine, stadol, and paragorics), 21 percent; stimulants abuse (Dexedrine, cocaine, and amphetamines), 16 percent; sedatives/hypnotics abuse (barbiturates, benzodiazepines, diazepam, Valium, Xanax, Fiorinol, Surital, and Placidyl), 23 percent; other drug abuse (marijuana), 3 percent; psychiatric illness, 12 percent; physical illness, 4 percent; and other illness, 9 percent. These data reflect distributions that have remained constant during the program's existence, with alcoholism and chemical dependency being the most common impairment.

Respondents were asked to report the initial treatment modality to which they were referred by the PRP. The modalities used and the frequency of use of each mode of treatment are presented in Figure 1.

Survey results further revealed that 62 percent of respondents were currently in some form of supportive therapy and/or were using self-help fellowships. Thirteen percent reported group therapy involvement, 19 percent individual therapy, and 47 percent were active in self-help fellowships (44 percent Alcoholics Anonymous, Narcotics Anonymous,

or Chemical Dependents Anonymous; 3 percent Alanon or Naranon; and 1 percent Adult Children of Alcoholics or Codependence Anonymous).

Recovery

Of the physicians who responded to the survey, 75 percent reported they were in recovery from their illness, with a mean recovery duration of eighty-eight months.

When asked to rate the current status of their family relationships and their occupational functioning, the majority of respondents assessed themselves as highly functional in these two primary life areas (Table 2).

One of the chief goals of the PRP is to intervene with a physician early in the course of his or her illness, before a pathological process progresses to where the ability to practice medicine is compromised and, therefore, adversely af-

Figure 1.

Table 2. Functional Status

Family functioning	Respondents (%)
Nonfunctional/Alone/Isolated	0
Severe family dysfunction/ Difficulty making friends	3
Some family dysfunction/Healing	0

Occupational functioning	Respondents (%)
Not functioning/Not seeking employment	1
Not functioning/Seeking employment	3
Minimal functioning/2-day work week	3
Moderate functioning/Working part-time or over time	4
High functioning/Working 3/4 time with minimal overtime	7
Optimal functioning/Working full and appropriate time	82

Table 1. Respondents' Medical Specialties

Medical specialties	Primary	Secondary
Family or general practice	27 %	
Psychiatry	11 %	
Surgery (otolaryngology, ophthalmology, obstetrics/gynecology)	13 %	1 %
Internal medicine (cardiovascular disease, nephrology)	26 %	1 %
Anesthesiology	5 %	3 %
Pediatrics	9 %	
Other (emergency medicine, addictionology)	7 %	13 %

Note: Due to rounding, totals do not equal 100.

fectured. Twenty-one percent of respondents reported negative consequences as a result of their impairment (Table 3).

Table 3. Consequences as result of impairment

Consequence	Percent
Suspension of drivers license	19
Loss of practice partnership	25
Loss of hospital privileges	13
Suspension of medical license	19
Revocation of medical license	6
Other	13

Note: Due to rounding, total does not equal 100.

Respondents were asked to rate (1= very poor, 5 = very good) the quality of their lives prior to entrance into the Physician Rehabilitation Program and at the time of the survey (Table 4). Respondents' reports

showed a significant improvement in their assessment of the quality of their life after their involvement with the Physician Rehabilitation Program (Figure 2). Additionally, 75 percent of respondents reported their experience with the PRP as being "Fair" to "Very Good." A few rated their experience with the PRP more negatively as a result of treatment experiences encountered outside of the program. Overall, respondents were very forthright with their comments and criticisms, most indicating their gratitude for the PRP's assistance.

Upon initial examination, the 75 percent overall recovery rate reported by respondents in this survey appears lower than those cited by other studies. However, the 83 percent recovery rate cited in the Morse study was based only on data related to alcoholism and drug abuse recovery, whereas this survey's overall rate of recovery was determined by incorporating physicians with all types of impairments. In the PRP survey, the rate of recovery was 86 percent for those with alcoholism and 90 percent for those with drug addiction. Our high overall rates of recovery as compared with recovery rates in the general population may be due, in part, to the PRP's close monitoring and support of program participants, as well as the fact that physicians may have a great deal more to lose than members of the general population. It has been suggested that the motivation to recover is stronger when the occupation at risk is high status, competitively sought, and identified closely with personal image and prestige.¹

Recently, the Maryland PRP has begun to use a five-year contract of monitoring and advocacy. This increased duration of monitoring is being used nationally, as it is anticipated that a longer period of monitoring will provide a better foundation for long-term (lifetime) recovery.

Hospital-based professional assistance committees: Literature review and guidelines

Robert K. White, M.A.; Robert P. Schwartz, M.D.;
David R. McDuff, M.D.; and Peter M. Hartmann, M.D.

From the University of Maryland Medical System where Mr. White is director, Employee Assistance Program; Dr. Schwartz is chairperson, Professional Assistance Committee; Dr. McDuff is chief, Division of Alcohol and Drug Abuse, Department of Psychiatry; and Dr. Hartmann is associate professor, Department of Family Medicine. Reprints: Robert K. White, 419 W. Redwood St., Suite 510, Baltimore, MD 21201.

This paper presents a review of the current literature on hospital professional assistance committees, a discussion of key issues, and a set of guidelines for the design and operation of these committees. The employee assistance program is suggested as a resource to these committees.

Much progress has been made in the field of physician impairment since the landmark article, "The Sick Physician," was published by the AMA Council on Mental Health in 1973.¹ The idea that a physician's ability to practice can suffer from such diseases as addiction, depression, or other psychiatric disorders is now widely accepted. State medical societies have made considerable progress in developing effective programs to identify and treat impaired physicians.^{2,3} Many state licensing boards have begun to work collaboratively with impaired physician committees in order to assure that sick physicians get the treatment they need to recover. The network of helping groups that has developed over the last twenty years is impressive.

In most states, however, hospitals have not been directly integrated into this process. (California is a notable exception.) Hospitals have relied on normal peer review activities to deal with the problem of an impaired physician.^{4,5} However, greater demands for corporate responsibility (i.e., liability) are being felt. Hospitals are being held accountable for the actions of their practitioners.^{6,7} Specifically, they are being asked to provide reasonable and adequate measures to identify and monitor physicians who may have had alcohol, drug, or psychiatric problems.⁸⁻¹¹

Hospitals represent a vital yet underdeveloped part of the helping network. The immediate colleagues and coworkers of a physician may be the first to notice that there is a problem needing attention. These coworkers will be more likely to call on an in-house group for assistance than an outside group. This makes it essential that there is an avenue within each hospital that can serve as a point of contact regarding impaired physicians. A hospital professional assistance committee (PAC) can serve as a valuable resource in this regard. This article will review the literature on these committees, describe the PAC at the University of Maryland Medical System, and discuss guidelines to set up similar committees.

Review of the literature

The literature on hospital impaired physician committees is about fifteen years old, with most articles appearing within the last ten years (1981–1991). A few of the publications offer suggestions about the design and function of hospital committees^{12–15} although the publications present widely different opinions on key issues. Most of the literature deals with the subject in a general way or is focused on a specific perspective such as legal liability.

The following discussion reviews the literature available on committee membership, confidentiality, recordkeeping, intervention procedures, coercion, committee activities, and legal issues.

Membership. There are widely divergent opinions about who should serve on a hospital committee. One school of thought clearly favors including physicians and others with authority, such as the president of the medical staff and the chief executive officer (CEO).^{5,14} Others stress that membership should be restricted to well-respected members of the medical staff who have no position of authority within the hospital.^{15–19} The concern of this latter group is that colleagues would be more likely to refer a physician to a nondisciplinary, confidential committee; the presence of authority figures would dampen that image. There is general agreement that no member of a peer review committee should also serve on the PAC.^{15–19} Any appearance of a conflict of interest should be avoided.

Confidentiality. There is significant disagreement about confidentiality regarding a hospital committee. On one side is the group that wishes the committee to be fully incorporated into the hospital administrative process so that the names of all reported physicians would be known to the hospital leadership.^{5,14} The other side wishes to operate in complete secrecy; no names would be recorded and no committee activities would ever be known, except to the committee itself.^{15,18,19} The arguments for and against stem from the authors' perspectives on patient care versus concern for the individual physician.

Intervention. Many committees have adopted the Talbott approach to intervention²⁰ whereby several committee members are assigned a case and then quietly approach the individual on one or more occasions in order to insist that s(he) seek appropriate treatment. If the committee members are unsuccessful, they may or may not report the case to the hospital administration. Crosby, Bissell, and others^{21–23} have outlined effective intervention methods for professionals that generally use consequences for noncompliance (e.g., a report to the appropriate authority).

Coercion. Many articles argue strongly for noncoercive measures, even if an identified physician has failed to comply with treatment recommendations.^{15,18,24} These authors take an advocacy-only perspective for the impaired physician and do not believe that it is appropriate for a PAC to cooperate with the physician discipline system in any way. Other articles encourage immediate notification of the disciplinary

bodies in order to safeguard patient care and reduce hospital liability.^{5,14}

Committee activities. The literature also varies widely on the nature of activities that are appropriate for a hospital PAC. Some authors recommend that the committee take an information and referral role only.^{15,19,25} Others believe it is essential for the committee to adopt a hands-on approach and to become actively involved in the identification, evaluation, monitoring, and advocacy of the impaired physician.^{5,14,16,24} Still others encourage the hospital PAC to act only with the approval of the state medical society program.²⁵ Most authors suggest that the PAC serve an educational role in the hospital community by organizing events promoting awareness of the committee and the issue of impairment among physicians.

Legal issues. The primary legal concern that has arisen over the years is the issue of corporate liability. Hospitals are being held responsible for the actions of their medical staffs.^{6,7,10} Hospitals can no longer leave the behavior of an impaired physician for the review of the medical society. Hospitals are now required to set up reasonable monitoring systems that will protect the patients from any harm that may befall them due to the inappropriate actions of an impaired practitioner.^{8,9,11} Hospitals must attempt to identify physicians who have had problems in the past and make sure that they are in stable recovery. The new emphasis on drug testing will only increase the pressure on hospitals to have these procedures in place and to act with sensitivity to the issues of patient care and due process for the physician.

Another legal concern discussed in the literature on hospital PACs is immunity. In some states (such as Maryland), the committee members are legally immune to any civil suit (as long as they have acted in good faith).²⁶ This is an important factor in allowing the committee and the impaired physician's colleagues to act without fear of civil suit by the identified physician. In Maryland, the immunity law applies to all medical review committees and all individual physicians who make reports to and/or work with such committees.

The University of Maryland Medical System's Professional Assistance Committee

The University of Maryland Medical System (UMMS) PAC was established as a standing committee of the medical staff in 1988. (There are about 1,500 physicians on the medical staff—900 attending and 600 residents.) The PAC originally offered information to the hospital community about impaired physicians and served as a referral source for the state medical society's program. The employee assistance program (EAP) staff were added to the committee in 1989, and the committee began to take a more active role in dealing with impaired physicians. The number of cases increased from three during the first year to nineteen as of September 1, 1991. The majority of the cases have been related to alcohol and/or drug dependence. The remaining cases (about 20 percent) were related to psychiatric or interpersonal problems. Referrals to the committee have come from a variety of sources including the board of medicine, the state medical

society, the credentials committee, department chiefs, and the EAP.

Medical staff affiliation. It has been important for the committee to be established as a formal part of the medical staff organization. This affiliation has insured that the committee operates according to procedures that have been approved by the medical staff, and that the committee is accountable to the hospital. When committees are set up on an informal basis, they become concerned solely with the well-being of the individual physician and sacrifice the important role of protecting patient care. The real mission of these committees is to balance these two goals carefully, recognizing the overriding concern of patient care while dealing compassionately with the needs of a sick physician.^{1,27}

An informal committee is less likely to use the potent leverage of referral to the appropriate authority as a way to influence an addicted physician to seek treatment. An informal committee is also less effective as an advocate for the recovered physician because the members are not recognized as legitimate spokespersons by an outside authority such as a state board of medicine, a malpractice carrier, or a credentials committee.

State medical society. The UMMS PAC has formed a strong working relationship with the state medical society program (Med Chi's Committee on Physician Rehabilitation). The two committees work together on many cases and have arranged for on-site follow-up and urine monitoring through the EAP office. The medical society uses the PAC as a local resource in the hospital. The PAC, on the other hand, calls on the medical society program for assistance in evaluation, intervention, and advocacy for many cases. Since the activities of both committees are confidential, they can offer the identified physician a safe avenue for treatment and recovery, as long as the physician is compliant with the treatment agreement.

In some cases, the PAC has found that it is more effective to have the medical society program intervene from the start. This is true when a physician is especially resistant to treatment and is not cooperative in any way. The medical society's involvement adds an additional sense of importance to the case and it lets the physician know that failure to comply will result in a report to the state board of medicine (Board of Physician Quality Assurance).

Employee assistance program. It is ironic that many hospitals already provide an assistance program for all of their staff *except* physicians, since physicians are not generally salaried employees. The EAP is a well-established model for providing free, confidential counseling to employees and their families.²⁸ The UMMS EAP can assess personal problems such as alcohol and drug dependence, depression, and family problems, and develop an appropriate treatment plan. Whenever possible, the EAP provides short-term counseling to resolve the problem. Otherwise, the employee is matched with a specific treatment provider.

Supervisors often refer employees to the EAP for evaluations because of job performance problems. Attendance

problems or deteriorating job performance can be symptoms of an underlying addiction or psychiatric problem. The EAP evaluates, refers to treatment, and monitors ongoing progress for supervisory referrals.

The hospital committee functions in the same fashion as the EAP but deals only with physicians. The committee accepts referrals from a variety of sources, arranges for specific evaluations, refers physicians to treatment, and monitors physician compliance to the treatment plan. In addition, the committee advocates for the physician as long as s(he) is in compliance with the treatment agreement.

Two of the major obstacles for professional assistance committees are a lack of paid staff to coordinate the work of the committee and a lack of specific expertise in addiction treatment. Linking the hospital PAC with the EAP helped to resolve both of these needs at UMMS. The committee functions as a specialized EAP for physicians—coordinating evaluations, referring physicians to treatment, monitoring progress in treatment, and serving as an advocate for persons in recovery. The committee members, though all physicians, may not be experienced in managing the treatment of an alcoholic, drug dependent, or psychiatrically impaired person. The EAP staff are trained in addiction treatment and can provide a level of expertise that may not be available otherwise.

The EAP has also provided the essential service of collecting observed urine screens. Urine drug screens are very important in evaluation and ongoing monitoring of addicted physicians. The universal problem is finding a suitable and reliable way to collect the specimen.

Committee membership. The UMMS PAC has excluded physicians and others in positions of authority such as the CEO, the president of the medical staff, and department heads. In order for the committee to operate, it must rely on the hospital community for referrals. Colleagues, coworkers, and staff are less likely to report a physician to a committee whose activities are not confidential or that appears to be disciplinary in nature. Also excluded from committee membership are persons who are currently members of a peer review committee or a credentials committee for the hospital. The committee has encouraged the participation of physicians who have been in recovery from addiction for at least two years.

Physician orientation. The UMMS PAC has been set up as a standing committee of the medical staff and is designed to deal with physicians. However, in some cases a nonphysician (e.g., nurse, dentist) has been referred to the committee and the committee has managed the case. This has occurred when the professional has clinical credentials through the medical staff. It has been important to develop a sense of peer support by making it clear that the committee is for physicians. Colleagues are more likely to refer to a committee of their peers.

The same is true for nurses. The UMMS Nursing Department has developed a separate impaired nurse committee that works with the EAP to provide information and referral services to the hospital community. Since all nurses are covered by the EAP as employees of the hospital, it is easier to arrange for evaluation and treatment.

Reporting noncompliant cases. The PAC has found it to be essential that any noncompliant cases (or any case that represents a danger to patient care) be reported to the appropriate authority (medical staff president, department head, board of medicine, or medical society). The only way for a committee to effectively motivate an addicted or impaired physician to seek treatment is to offer an informal, confidential, nondisciplinary process as an alternative to a formal, public, disciplinary procedure. This leverage is essential to ensure that the impaired physician will accept help. Committees that fail to use this leverage do not understand addiction treatment and abdicate their responsibility to patient care.

It could also be argued that failure to report an addicted or impaired physician who has refused to comply with treatment is tantamount to "enabling." Enabling is the term used to describe the actions of well-meaning persons who protect addicts or alcoholics from the consequences of their behavior and, thus, allow (enable) the disease to progress unchecked.

Recordkeeping. The UMMS PAC keeps regular minutes at the committee meetings but does not record names or other identifying information. The status of cases is reviewed during the meetings but only code numbers are used in the minutes. All client records are kept in the EAP files as confidential files. These records are protected by the federal confidentiality regulations that apply to all EAPs and alcohol/drug abuse programs. Documentation kept in the client record includes evaluations, urine screen results, treatment contracts, correspondence, progress notes, and any written material related to the case.

An ongoing case record is essential in the management of an impaired physician. Cases may be monitored for five years or longer, and detailed knowledge of the individual's progress is necessary to make sound decisions about treatment planning. It is also very important to the individual physician who has achieved recovery to be able to document that recovery through letters of support from the committee. This would be impossible without a formal case record.

Committee activities. The PAC engages in the following activities: receiving reports, discreetly collecting information, interviewing identified physicians, referring physicians to specialists for evaluations, referring physicians to the medical society, referring physicians to treatment, establishing treatment contracts (agreements), monitoring compliance with treatment contracts, coordinating urine screens, reporting noncompliant cases to appropriate authorities, providing support and advocacy to recovered physicians, and educating the hospital community about impairment.

The PAC does not offer treatment services nor does it provide formal evaluations. The committee members only perform committee work. They do not practice medicine or provide addiction treatment with individuals who are referred to the committee. When a documented evaluation is required, then the physician is referred to an outside professional who specializes in the area relevant to the physician's difficulty (e.g., psychiatry, addiction, neurology). The committee acts on the written recommendations of an outside specialist. This

distinction becomes quite important when a physician is resistant to treatment and a report must be made. It is essential for the committee to be acting on documented recommendations from a professional who is experienced in that area. Committee members have to be careful to wear one hat at a time.

Summary and guidelines

Hospitals are a very important part of the helping network that can assist the impaired physician. Hospital medical staff are in a position to notice a problem before it comes to the attention of a state organization. A hospital PAC is an effective way to extend the helping network and enhance the work that is being done by the state medical societies. These hospital-based committees can work collaboratively with the state level programs to identify and monitor impaired physicians. The following guidelines are based on a review of the literature and the experience of the University of Maryland PAC.

1. Begin by establishing a professional assistance committee, through the medical staff, that will provide educational activities and serve as a resource to the hospital.
2. During the first year of operation
 - a. Meet with representatives of the state medical society's impaired physician program (where available), and determine ways that the two groups can work together;
 - b. Assess the level of addiction expertise that is available to the committee;
 - c. Explore the possibility of paid support staff such as a certified employee assistance professional (CEAP) or a certified addictions counselor (CAC);
 - d. Meet with hospital legal counsel to discuss operation of the committee including immunity, recordkeeping, and reporting requirements; and
 - e. Meet with representatives of the state licensing board to establish a cooperative relationship.
3. The bylaws should be designed to
 - a. Exclude from membership persons in supervisory positions and physicians who serve on a peer review or credentials committee;
 - b. Clearly establish that the committee can function confidentially unless the identified physician is noncompliant with treatment or presents a danger to patient care (noncompliant physicians will be referred to the appropriate authority);
 - c. Include members and paid staff (e.g., EAP) who are experienced in addiction treatment;
 - d. Encourage a strong working relationship with the state's impaired physician program, where one exists; and
 - e. Clearly describe the activities of the committee.
4. Decide on the advisability of including other professional groups (e.g., nurses, pharmacists) based on the size of the hospital and the needs of the professional community.
5. Promote awareness of the committee through printed materials and educational events.

Patterns of substance use in the medical profession

Patrick H. Hughes, M.D.; Carla Storr, M.P.H.;
DeWitt C. Baldwin, Jr., M.D.; Kristine M. Williams, M.U.P.;
Scott Conard, M.D.; and David Sheehan, M.D.

Dr. Hughes is associate professor, Center for the Study of Impaired Professionals, Institute for Research in Psychiatry, University of South Florida College of Medicine, Tampa, FL and senior consultant, Drug Abuse Program, James A. Haley Veterans Hospital, Tampa, FL; Ms. Storr is a doctoral candidate, School of Hygiene and Public Health, Johns Hopkins University, Baltimore, MD; Dr. Baldwin is a scholar-in-residence, Division of Medical Education Research, American Medical Association, Chicago, IL; Ms. Williams is a research associate, Institute for Research in Psychiatry, University of South Florida College of Medicine; Dr. Conard is assistant clinical professor, Department of Family and Community Medicine, University of Texas Health Science Center, Dallas, TX; and Dr. Sheehan is professor of psychiatry and director of research, Institute for Research in Psychiatry, University of South Florida College of Medicine. These projects were supported in part by the American Medical Association, Division of Medical Education Research, Chicago, IL, and grant #1-RO1DA04877 from the National Institute on Drug Abuse, Rockville, MD.

National drug use surveys of medical students and resident physicians in 1987 found that medical school was not a time when students began to use drugs, nor was it a time when they engaged in heavy use. Medical students and resident physicians reported lower rates of illicit drug use than their age and gender counterparts. Although males generally were more likely to use substances than females, young male and female physicians resembled one another in their current rates of substance use more than they resembled their gender counterparts in society.

As reports of cocaine use and dependence became more widespread in the mid 1980s, there was concern over the lack of current data on medical student use of cocaine and other drugs. This provided a stimulus for a series of national studies on substance use in the medical profession and led to the establishment of a Center for the Study of Impaired Professionals in the University of South Florida, Department of Psychiatry.¹

The studies focused on medical students, residents, and practicing physicians and were patterned after survey research underway on substance use among US high school graduates,^{2,3} college graduates,^{2,3} and households⁴ to allow comparison with substance use trends in the general population. Questions for the medical student and resident surveys covered demographic characteristics, substance use, reasons for use, medical specialty, work activities, access to drugs, and substance abuse education.

Questions covering consequences of use, frequency of prescribing each of the controlled substances, and frequency of direct physical access to controlled substances in the workplace were added for the survey of practicing physicians.

Previous studies of substance use in the medical profession have focused on a single state, region, or treatment program, raising concerns

of sampling or referral bias and precluding comparisons with the main body of epidemiologic research on drug use in this country. The studies reviewed here extended the earlier survey research of McAuliffe et al on substance use among medical students, residents, and practicing physicians in one New England state.⁵⁻⁷

Medical students

With funding from the American Medical Association (AMA), the center initiated its first project in 1986—a pilot survey of 1,427 senior medical students at thirteen medical schools across the country.^{8,9} Questionnaires were anonymously administered and elicited data on demographic characteristics, use of eleven frequently abused substances, sources of knowledge about drugs, and attitudes toward drug use. Data on substance use among young adults of similar age in the general population were provided by Johnston et al.²

The results were at once alarming and encouraging. Of the 589 medical students who returned usable questionnaires, 36 percent had tried cocaine, 74 percent had smoked marijuana in their lifetime, and a substantial proportion reported having used cocaine (17 percent) and marijuana (32 percent) in the year prior to the survey. Furthermore, attitudes toward use of these substances were lenient—the majority believed that occasional use of these substances represented little or no risk to the user and should carry no negative consequences. Nonetheless, medical students reported lower rates of cocaine and marijuana use than their age and gender cohorts in the general population and were also significantly less likely to have used either drug in the year before the survey.

After further refining the questionnaire, we received support from the American Medical Association for an expanded study. This survey, conducted in 1987, covered a sample of 3,052 senior students from twenty-three US medical schools.¹⁰ Johnston et al again provided, for comparison purposes, data collected in 1987 on an age-similar cohort in the general population.³

Sixty-seven percent of the medical students surveyed responded. Significantly fewer reported ever using marijuana (66 percent) or cocaine (32 percent) than their high school graduate age peers, although medical student "lifetime ever" rates were comparable to other college graduates. Rates of cocaine or marijuana use in the year or month before the survey were, however, significantly lower for medical students than college graduates or those with only a high school education. Attitudes toward occasional use of marijuana corresponded with those expressed in the pilot survey, but the majority believed that occasional use of cocaine and other psychoactive substances (except alcohol) was of sufficient concern to warrant counseling or treatment. Over 90 percent of those who reported substance use, had begun using these substances before entering medical school. Only

for benzodiazepine tranquilizers did a substantial proportion who ever used (36 percent) begin use during medical school.

Resident physicians

In 1987, we received support from the AMA to use the same questionnaire for a study of resident physicians.¹¹ The sample for this study consisted of 3,000 third-year residents randomly selected from the AMA's master file of US physicians. The master file, which includes AMA members and nonmembers, is considered the most comprehensive list of US physicians available. Residents were asked about their use of eleven substances. For controlled prescription substances, respondents were instructed only to report use "not prescribed by another physician for a legitimate medical or psychiatric condition," thereby eliminating supervised medical use.

Sixty percent of the resident physicians surveyed responded (N=1,785). Resident physicians had lower rates of illicit substance use and higher rates of use of certain controlled prescription drugs than their nonphysician age and gender peers. But residents differed from medical students in two key ways. First, residents' rates of recent cocaine and marijuana use were much lower. Second, they were more likely to use benzodiazepines than medical students. The primary reason given for use of prescription substances was self-treatment, whereas illicit substances and alcohol were primarily used for recreation.

When medical students and residents were compared with each other and with their age and gender peers, several trends emerged. **Figure 1** illustrates cocaine use among high school and college graduates (average age: 28.6 years) surveyed in 1987 by Johnston et al,³ and medical students (average age: 27.7 years) and residents (average age: 30 years) from our 1987 surveys. Male and female residents had consistently lower rates of substance use for most substances than their age and gender peers in the general population—differences that

Figure 1 - Cocaine use in the past year by education and gender*

* 1987 surveys of medical students, residents, and high school or college graduates of similar age.

were significant for marijuana, cocaine, cigarettes, and amphetamines. Female residents were significantly more likely, however, to use alcohol and benzodiazepines than females of similar age in the general population. Male residents were significantly more likely than female residents to have tried marijuana or to smoke cigarettes, but significantly less likely to use either substance than other males of similar age. Male and female residents tended to be more like each other than their age and gender peers in their past year and past month use of six of the eleven substances.

Data on when use of the various substances was initiated revealed that most residents who engaged in substance use had initiated such use in college or earlier (Figure 2). Use of controlled prescription substances, however, suggested a different trend. A substantial proportion of residents who had ever used benzodiazepines or opiates began their use during residency.

Practicing physicians

Following the resident survey, the center received support from the National Institute of Drug Abuse for the first national survey of substance use among US physicians. The survey was performed in 1989 and 1990, and the initial results are being reviewed for publication. A preliminary review of the data suggests that practicing physicians more closely resemble medical students and residents in reporting lower rates of marijuana and cocaine use than their age and gender counterparts in the general population. Practicing physicians do, however, have a unique relationship with the controlled substances they prescribe to patients in their daily work. This relationship will be described in future reports.

Discussion

The medical students, residents, and physicians surveyed seem to fall into two general categories: (1) those who use alcohol and illicit substances for recreation and (2) those who

use controlled prescription drugs for self-treatment. Recreational use of illicit drugs and alcohol appears higher among medical students and young physicians than among those in later stages of practice. This pattern is consistent with widespread experimentation with illicit drugs by young Americans throughout the 1970s and 1980s. Our analyses of medical students, residents, and practicing physicians support McAuliffe's earlier conclusion that recreational drug use in the younger generation of physicians is greater than that of previous generations.⁵

The finding that a substantial minority of young physicians initiated use of opiates and benzodiazepines during residency is disturbing for two reasons. The first is the tendency for some young physicians to treat themselves with these substances, rather than use them under the supervision of another physician. The second concern is that both opiates and benzodiazepines carry the potential of chemical dependence.

Self-treatment with controlled prescription drugs continues to occur despite longstanding warnings in the medical profession against such practice. The old adage, "the physician who treats himself has a fool for a patient," applies equally to today's physicians. The Federation of State Medical Boards of the United States takes a firm position in its model medical practice act against prescribing controlled substances to oneself or to a member of one's immediate family. Yet as of August 1991, only 50 percent of the states had a formal policy against self-treatment.¹² A few of these, including California, Florida, New Hampshire, Washington, Wisconsin, and Wyoming, have written this proscription into state law. In most other states, however, the policy was adopted through the administrative rules of the state medical licensing board.

State medical board policies vary. Some prohibit self or family treatment, some make allowances for emergencies, and others simply admonish that treatment of oneself or one's immediate family with a controlled substance could be

grounds for disciplinary action when there is suspicion of, or potential for, substance abuse. Canada's Minister of National Health and Welfare has issued a national policy directive that physicians should not treat themselves or an immediate family member with a narcotic or controlled drug "in other than an emergency situation."¹³ The policy statement calls such practice "unethical" and warns that "experience over the years has demonstrated that practitioners involved in this practice may encounter various problems that too often become uncontrollable." The authors agree that self-treatment with controlled sub-

Figure 2 - Educational stage when residents initiated substance use.
1987 Resident Physician Survey

stances places the physician at risk of substance abuse, and should therefore be avoided.

Relapse and recovery: Five to ten year follow-up study of chemically dependent physicians—The Georgia experience

Karl V. Gallegos, M.D.; Barry H. Lubin, M.D.;
Carol Bowers, R.N.C.D.; James W. Blevins, M.D.;
G. Douglas Talbott, M.D.; and Philip O. Wilson, M.D.

Of 100 physicians who entered into a continuing care contract during a five-year period with the Impaired Physicians Program of the Medical Association of Georgia, seventy-seven have maintained documentable abstinence from all mood-altering substances. One physician was lost to follow-up. Twenty-two relapsed, eighteen of whom have undergone another treatment for chemical dependence. Only one physician in the relapse group has been involved in a pattern of chronic relapsing behavior.

Dr. Gallegos is the director of the Division of Data and Statistics, Caduceus Foundation; Dr. Lubin is the director of Continuing Care Services for the Talbott Recovery System; Ms. Bowers is the coordinator for the Health Professionals Program; Dr. Blevins is a staff psychiatrist at Anchor Hospital and with the Talbott Recovery System; Dr. Talbott is professor of psychiatry, Emory University and founder of the Medical Association of Georgia's Impaired Physicians Program; and Dr. Wilson is the medical director for Inpatient Services, Anchor Hospital. This project has been sponsored by a grant from the American Medical Association (AMA) Education Research Foundation (ERF), and the Caduceus Foundation. Reprints: Barry Lubin, M.D., Director of Aftercare Services, Talbott Recovery System, 5448 Yorktowne Drive, Atlanta, GA 30349.

Ultimately, the most critical issue in reviewing the treatment of chemically dependent physicians is the evaluation of the effectiveness of treatment. The primary goal of chemical dependence treatment, as in other areas of medicine, is to help the patient to achieve and maintain long-term remission of disease.¹ Treatment outcomes for physicians recovering from substance abuse vary considerably, with positive results ranging from 27 percent² to 92 percent.³ Because of methodological differences in treatment and outcome structure, it is difficult to accurately categorize programs for the sake of meta-analysis.

The interpretation of treatment outcomes⁴ that specifically address recovery in the impaired physician has been hampered by a number of factors. Notable among these⁵ are differences in the population under study (reliance on inadequate or incomplete diagnostic criteria in choosing subjects for study); failure to adequately account for treatment dropouts in analysis of treatment outcome data; failure to follow patients for adequate lengths of time post treatment; and failure to provide for adequate, multidimensional treatment outcome measures that map a full range of patient behavior.

The purpose of this brief preliminary report is to (1) determine if there are specific pretreatment, demographic, professional, and/or substance abuse factors that predispose an individual to relapse; (2) define the relapse rate as a function of time; (3) describe posttreatment factors associated with relapse; and (4) present specific recovery components the

authors believe are important in the prevention of relapse among recovering physicians.

Methods

Background. In 1975, the Medical Association of Georgia (MAG) implemented its Impaired Physicians Program (IPP) statewide.⁶ Since then, more than 2,500 physicians from all fifty states and from five foreign countries have presented for evaluation and/or treatment of impairment. Research was begun in 1983 to (1) characterize the impaired physician; (2) stage the disease of chemical dependence and its recovery; and (3) provide necessary treatment process evaluation to guide the implementation of new practices into the treatment program.

This investigation was designed to determine if there are times in the course after treatment when individuals appear to be more vulnerable to relapse. Through an extensive interview process, all of the individuals who relapsed were evaluated. They were asked detailed questions about their relapse, responses to which were validated by family members and professional colleagues.

The continuing care contract. All members of the study group signed a contract that committed them to participation in a continuing care program for twenty months. Said individuals agreed to abstain from all mood-altering substances (alcohol and/or drugs) except as prescribed by their primary care physician or approved by their monitoring professional/addictionologist, and to follow a relapse contract. The relapse contract specifies that individuals who relapse must contact their Alcoholics Anonymous/Narcotics Anonymous (AA/NA) sponsor, inform their monitoring physician, and report the relapse to a member of the continuing care committee.

The continuing care contract also specifies that signees must undergo frequent, randomized, unscheduled urine drug screens; have a primary care physician who will attend to their medical needs; and have a monitoring physician who will serve as a recovery-mentor while assessing progress in recovery for the signee. Each person who enters into the contract agreed to go to a minimum of five AA or NA meetings a week, and to one Caduceus Club⁷ meeting per week. Many of these individuals also agreed to go to individual and/or marriage and family therapy when indicated. Those who had a co-morbid psychiatric illness had to agree to continue therapy with a psychiatrist and take appropriate medicines that were to be prescribed. Each individual also was allowed to create his or her own spiritual program, physical fitness program, and leisure activity schedule. There were monthly follow-up meetings to review the physician-patient's progress in recovery. Spouses or significant others were also encouraged to attend. Reports from many sources allowed the continuing care services program to evaluate an individual's recovery.

This continuing care program continues to be modified as process evaluation research indicates. The program described above was the aftercare program used during the study period. There have been numerous changes made as a result of this research.

Results

Description of the study population. Between July 1982 and June 1987, one hundred physicians who consecutively entered into a continuing care contract with the Georgia Impaired Physicians Program were included in an outcome study (Table 1). All resided in Georgia. Ninety-four had completed all phases of the Georgia Impaired Physicians Treatment Program and upon completion signed their continuing care agreement. Two did not successfully complete the full treatment process (they had a partial treatment), but were allowed to sign the contract and begin the continuing care program. These two individuals refused to continue their treatment but were not discharged from the program against medical advice. Four entered into the agreement after a comprehensive ninety-six-hour assessment. Two of these four had already successfully completed another treatment

program and requested follow-up in the Georgia IPP continuing care monitoring system. The other two refused treatment, even though a diagnosis of addiction was established and treatment was recommended. These two individuals were convinced that they did not need treatment to stay sober, and requested follow-up in the Georgia IPP continuing care program. All one hundred physicians had completed the full recommended treatment process for chemical dependence. Although all had a primary diagnosis of chemical dependence, sixteen had a concurrent psychiatric diagnosis.

The mean age for the study group was 39 years (standard deviation=9.9). There was a statistically significant overrepresentation of young physicians and an underrepresentation of older physicians in the study group in comparison with the population of all Georgia physicians.⁸ Men constituted 92 percent of the study group as compared with 88 percent of all Georgia doctors. Five percent of the physician-patients were African-American, 95 percent were white. Women and African-Americans were proportionately represented in this sample of physicians.

Less than half (45 percent) of the physician-patients were married when they presented for treatment. Fifteen were divorced, eight were separated, and two were widowed. There was a significant prevalence⁹ of individuals in the study population who had never been married (N=30). Marital discord as a result of the chemical dependence was reported by 84 percent of those who were married, widowed, separated, or divorced.

Substance abuse patterns. Table 2 describes patterns of substance abuse. Alcohol was the drug most commonly

abused, followed by cocaine, meperidine hydrochloride, and diazepam. Polydrug abuse was frequently seen. Only twelve physician-patients reported abuse of a single substance, and for ten of these twelve, alcohol was the drug reportedly used. The younger physicians were more likely to abuse multiple substances including street drugs (e.g. THC (tetrahydrocannabinol) and cocaine). Forty-six physician-patients reported abusing drugs parenterally. Most of the study group (58 percent) had had some form of previous alcohol and drug and/or psychiatric treatment for their problems.

Practice and license status. There was a statistically significant overrepresentation of residents and unemployed physicians in the study group. Several specialties were also overrepresented including anesthesia, general and family practice, and psychiatry. Many physician-patients had serious legal and or licensing problems (Table 3) associated with their substance abuse. Only 51 percent of the total did not report a license or a criminal/legal problem.

Outcome

Seventy-seven physician-patients have maintained documentable abstinence from all mood-altering substances since the initiation of their continuing care contract. All of these individuals have successfully completed their continuing care contracts. These individuals have continued to participate in a recovery program for five to ten years after completing treatment. One of the seventy-seven died of sudden cardiovascular causes in the seventh year of recovery. All of the remaining physician-patients are currently practicing medicine, except for three who retired.

One of the original 100 physician-patients maintained documented recovery for at least three years but has since moved. This patient could not be found to update the recovery information and was counted as being lost to follow-up.

Twenty-two physician-patients have had a documented relapse. Eighteen have undergone another treatment for their chemical dependence. Of those who relapsed, one died during his relapse. All but four of the remaining physicians in the relapse group currently have had at least two years of continuous sobriety since their relapse. Of those who relapsed and are alive, all but three are currently practicing medicine. Two are retired. Only one of the physicians within the relapse study group has been involved in a pattern of

continuous, chronic, relapsing behavior since the initiation of relapse; this individual is not practicing medicine.

Who relapses?

The relapse group (N=22) was compared with those who did not relapse (N=77). There was no significant difference between the two groups with respect to any pretreatment or treatment variables studied (Tables 1–3). However, all physician-patients who relapsed stated that they had stopped participating in a recovery program prior to their relapse (i.e., either they had stopped going to AA/NA meetings altogether or went infrequently).

Special attention needs to be given to the four individuals who signed a continuing care contract without successfully completing treatment. Two completed partial treatment and two refused treatment after their ninety-six-hour assessment. All of these individuals relapsed within twelve months of signing their aftercare agreement.

Eleven physician-patients relapsed in the first year after completion of treatment. Four relapsed in their second year.

Approximately 68 percent (15 of 22) of all those who relapsed, did so before completing their two-year continuing care contract. Two patients relapsed in their third year. In the population studied, the incidence of relapse (Figure) seems to taper off after the third year. Only one physician-patient relapsed in years four, five, six, seven, and eight of their recovery. To date, no one has relapsed in their ninth or tenth year of recovery.

When those who relapsed were questioned extensively about the stressors in their lives that may have precipitated their relapse, several factors emerged as possible risk factors for relapse (Table 4). In general terms, those who relapsed within the first year of signing an aftercare contract were more likely not to believe the disease concept. They were more likely to believe that they did not need the recommended help. In spite of the threat of loss of advocacy from the program and in spite of knowledge that they were being scrupulously monitored, these physician-patients believed they would not run into difficulties.

Family and emotional issues frequently triggered relapse in those who relapsed after the second year of recovery. In virtually all cases, relapse began with behavioral dynamics that reactivated their denial of their condition and isolation, elevated their stress, and impaired their judgment. Each individual slowly stopped going to AA/NA meetings. There is no evidence that fear of losing a license to practice medicine or any other legal, marital, or professional sanction could inhibit a relapse or promote recovery.

Discussion

Recovery from the disease of chemical dependence is a continuous process, although only a few theorists¹⁰⁻¹³ have recognized the importance of examining abstinence as part of the total process of chemical dependence. Research to refine our understanding of specific risk factors for relapse and ways to prevent these factors are needed. Indeed, preventing relapse is the fundamental issue in addiction treatment today. Physicians who relapse can have a significant impact on themselves and their families, and also on the patients they serve and on the medical profession. Investigation into reducing the potential for relapse in recovering physicians (and other health professionals) is urgently needed.

The continuing care program sponsored by Talbott Recovery System, a private treatment program that works with the Impaired Physicians Program of the Medical Association of Georgia, has evolved over the course of several years and was developed to facilitate, reinforce, and maintain an individual's decision to stop drinking and/or using drugs. By the criteria and philosophy of the continuing care plan, physician-patients are responsible for their own recovery; they are held personally accountable. When physician-patients follow the continuing care plan, the advocacy of the program is granted. This kind of contingency contract appears to be very effective.

Physician-patients who have the most success in maintaining their recovery understand the need for AA/NA meetings and attend regularly. They use their sponsor to discuss issues of importance in their lives. Such individuals gladly use their

Figure. The time course of first relapse-after-treatment events in the population of physician-patients studied.

Table 4. Factors that contribute to relapse

1. Failure to understand and accept the disease.
2. Denial or loss of control.
3. Dishonesty, usually taking the form of reality distortion and emotional concealment.
4. The dysfunctional family.
5. The lack of a spiritual program.
6. Stress, and the inability to cope with stress.
7. Isolation, and failure to become an active member of AA and/or NA.
8. Untreated secondary addictions (e.g., food, sex, work).
9. Cross-addiction.
10. Holiday Syndrome (increased probability of relapse during holidays).
11. Withdrawal.
12. Overconfidence.
13. A return to drinking or using friends and old habits.
14. Guilt over the past.
15. Medical problems.
16. Not successfully completing treatment.
17. Poor "continuing care" monitoring.

monitoring physician as a professional mentor to discuss problems related to recovery and the practice of medicine.

Central to the philosophy of AA is the concept of a higher power,¹⁴ as discussed at length in *The Big Book of Alcoholics Anonymous*. The authors feel a spiritual program, such as the one promoted by AA, is an essential ingredient of recovery.

Physician-patients who are most successful in their recovery avoid emotions such as anger, guilt, depression, anxiety and insomnia by using the program's principles.¹⁵ Physician-patients also must avoid compulsive behavior (e.g., sex, work, food, shopping, nicotine, gambling, theft, speeding). These physician-patients realize the importance of becoming skillful in participating in important relationships (family, sponsor, significant-other, spouse, parents, children, and friends). They learn to work on the dysfunctional aspects of relationships and improve on the positive parts of friendships. Isolation is most often a key symptom of the disease of chemical dependence. Recovery demands "re-people-ization."

Physical health, exercise, rest, and leisure time are also important parts of a recovery program. Physicians learn early about the work ethic. However, recovery requires that the recovering physician-patient set priorities. Physicians who appear to do the best in their recovery develop a profound and abiding attitude of gratitude. They learn to have open and honest communication with family members. They are regular in their attendance at AA/NA and continuing care meetings. They communicate regularly with their sponsor, take a daily inventory, and check out their behavior with trusted family members and recovering friends. These behaviors must become a normal part of the recovering physician's life.

Glossary

The lack of precise definitions and universal agreement on language has hampered effective communication among professions.¹⁵ For the purpose of this presentation, we provide selected nomenclature as defined by the American Medical Association's (AMA's) Council on Scientific Affairs (CSA) Panel on Alcoholism and Drug Abuse.¹⁶

Abstinence: Cessation of use of a psychoactive substance previously abused or upon which the user has developed drug dependence.

Chemical Dependence: Generic term relating to psychological or physical dependence, or both, on an exogenous substance.

Recovery: A process of overcoming both physiological and psychological dependencies on a drug or on alcohol.

Rehabilitation: The restoration of an optimal state of health by medical, psychological, social, and peer group support for a chemically dependent person and his or her significant other.

Relapse: Recurrence of alcohol or other drug dependent behavior in an individual who has previously achieved and maintained abstinence for a significant time beyond the period of detoxification.

Sobriety: Generally refers to the state of complete abstinence from alcohol and other drugs of abuse in conjunction with a satisfactory quality of life.

Treatment: Application of planned procedures to identify and change patterns of behavior that are maladaptive, destructive

The Impaired Physician Program of the Medical Society of the District of Columbia

Donald C. Meek, M.D.

Dr. Meek is chairperson of the Medical Society of the District of Columbia Physician Health Committee.

The Impaired Physician Program of the Medical Society of the District of Columbia was established in 1980. Although the society maintained very active peer review programs prior to that time, it became clear that some of the physicians who were being seen in the peer review committees were ill and were not well-served in a disciplinary milieu. Concurrently, the American Medical Association (AMA) was also encouraging and assisting state medical societies in the development of impaired physician programs. A November 1972 report of the AMA Council on Mental Health stated that "(I)t is a physician's ethical responsibility to take cognizance of a colleague's inability to practice medicine adequately by reason of physical or mental illness including alcoholism or drug dependence."¹ After a modest start, the DC program came into its own in 1983 when Martin J. Valaske, M.D. became chairperson of the Impaired Physician's Committee. Under Dr. Valaske's leadership, the program developed into one that not only accepted cases that came to its attention, but sought to identify those that had not yet surfaced.

Funding for the program has improved gradually over the years. Initially supported strictly by general society dues, program funding has been augmented at various times by a special dues assessment and contributions from the Medical Society and Auxiliary Foundation. In 1989, the District of Columbia Hospital Association made a contribution on behalf of Washington, DC-based hospitals. Additional sources of funding continue to be sought from those agencies and institutions that benefit from the existence of the program, particularly in light of the fact that the program serves both members and nonmembers of the medical society.

How it works

The Physician Health Committee, comprised of twenty-four practicing physicians, has primary responsibility for the Impaired Physician Program. The committee chairperson acts as director of the program and answers to the society's executive board; two full-time staff members, who are responsible for the society's peer review activities, handle the day-to-day functioning of the program. Expressions of concern regarding

Since its establishment in 1980, 128 physicians have been referred to the Impaired Physician Program of the Medical Society of the District of Columbia, of whom sixty-four have either successfully completed the program or are in stable recovery.

the health and well-being of any physician practicing in the District of Columbia are accepted from any source. Although callers are asked to identify themselves, the names of reporters and the contents of reports are confidential. Once a report is received, efforts are made to discreetly verify its accuracy. If sufficient evidence exists that there may be a problem, an intervention is arranged. Interventions are a highly specialized process of getting through the physician's ever-present denial and getting the physician to agree to an initial evaluation or to treatment if there is agreement that a problem exists. Participants in the intervention include appropriate representatives of the Physician Health Committee and sometimes members of the physician's family. The ultimate goal of the process is to have the physician go for an evaluation immediately following the intervention, and arrangements for the evaluation are made in advance of the meeting. In some cases, it is determined that no impairment exists and the case is closed without prejudice to the physician.

If the existence of an impairment is confirmed and treatment guidelines are established, the physician signs an agreement with the program. Program participants generally agree to abstain from use of all mood-altering substances, to obtain urine screening, to attend self-help groups, and, for those suffering from chemical dependence, to complete an annual continuing medical education (CME) requirement on substance abuse. Participants also agree to obtain appropriate treatment, to meet monthly with a monitor assigned to them from the Physician Health Committee, and to permit open communication with the chief of staff where they hold hospital privileges or with other employers. Those physicians suffering from physical or psychiatric problems other than substance abuse sign appropriately tailored agreements. Agreements are typically for a five-year period. If an immediate diagnosis is not possible, the physician may be placed under a monitoring agreement for a period of time until a diagnosis can be established.

Physicians who come under the supervision of the program frequently have problems with their malpractice insurance carrier, hospital credentials committee, or licensure board. In addition to identifying, assisting, and monitoring impaired physicians, a key function of the program is to advocate for those physicians who are in compliance with the terms of their agreement and are in solid recovery. In addition to the desire to be helped, it is this aspect of the program that most frequently draws physicians into the program.

Experience

Since its inception in 1980, 128 physicians have been referred to the Impaired Physician Program. **Figure 1** shows referrals on an annual basis. Of these 128 physicians (**Figure 2**), twenty-six have successfully completed the terms of their agreement with the program. Thirty-eight of these physicians are currently under active monitoring with the program. Seven physicians remain under investigation. The no action category, which contains thirty-four physicians, includes those situations in which no impairment could be identified

or substantiated, the impairment did not have an impact on patient care, or the matter was more appropriately handled by an impaired physician program in another state. Five of the physicians died of their disease, and six were encouraged to cease practice, usually because of advanced age. In twelve cases, the program withdrew its advocacy because of the physician's failure to cooperate. These cases were either reported to the Board of Medicine or to another responsible entity such as a medical school dean in the case of a medical student.

Figure 3 reflects the distribution by age of those physicians in whom an impairment was found. The cases confirmed by the program include drug/alcohol addiction (81 percent), psychiatric problems other than drug/alcohol addiction (13 percent), and physical problems that impaired functioning (5 percent). Thirty-five percent of the addicted were alcoholic and 43 percent were drug addicted. Of the drug addicted, their drugs of choice were as follows: cocaine, 35 percent; poly-drug addicted, 35 percent; Percodan, 8 percent; butalbital, 4 percent; amphetamines, 3 percent; heroin, 3 percent; opiates, 3 percent; Fiorinol, 3 percent; Dilaudid, 3 percent; and fentanyl, 3 percent.

Figure 1.

Figure 2.

Reporting sources included twenty-nine institutional referrals, usually hospitals. There were ninety-one personal referrals; personal referrals include self-referrals and referrals by colleagues, spouses, coworkers, and patients. Three referrals came from the legal system. **Figure 4** illustrates the gender distribution in which eighty-seven of those physicians found to be impaired were male and fourteen were female. The distribution among the medical specialties is reflected in the **Table 1**.

Conclusion

Acceptance of the District of Columbia Impaired Physician Program has improved dramatically since its inception. Physicians have become much more willing to self-refer because of the positive comments they have heard about the program's success rate (**Figure 5**). Being a program partici-

pant has also become somewhat less stigmatizing. There is an increased willingness to grant licensure, privileges, or employment to those physicians who may have had a problem, but who are now in solid recovery and under strict monitoring.

Hospitals are making more and more referrals, and they, as well as licensure boards, are relying on the program to monitor physicians on their behalf and provide periodic reports.

Hospitals have also provided funding for the program, which we take as a significant vote of confidence.

The program relies heavily on the reports of others in identifying physicians who may need assistance. Do you suspect that a colleague practicing in the District of Columbia may be impaired? If so, please call for confidential assistance. We can be reached at (202) 466-1800 during business hours and at (202) 466-1809 at all other times. Ask for the Impaired Physician Program.

Making Life Better For Your Terminally Ill Patients

Your patient has been diagnosed with a terminal illness and wishes to spend the rest of his life at home. During this time, you want him to be well cared for and comfortable. With the **Bon Secours Hospice Program**, you can provide your patient with the best, most comprehensive care available.

The **Bon Secours Hospice Program** emphasizes the family and patient as the unit of care and offers:

- On call services for medical emergencies • Continuous care for medical crises
- An interdisciplinary team approach that includes Skilled Nurses, Home Health Aides, Medical Social Workers, Pastoral counseling, and Volunteers
- Respite care • Pharmaceuticals (95% covered) • Medical Equipment
- Experience in pain management • Bereavement follow-up for the family

For more information on this beneficial program call 837-8500.

Bon Secours Home Health / Hospice

Bon Secours Hospice Program is a licensed and certified Hospice with a tradition of care since 1881

Nine years experience with chemically dependent physicians: The New Jersey experience

Edward G. Reading, M.Div., NCAC II

Reverend Reading, a Roman Catholic priest of the Diocese of Paterson, is assistant director, Physicians' Health Program of the Medical Society of New Jersey, and secretary, Board of Directors of the National Federation of State Physicians Health Programs.

Few studies have been able to retroactively evaluate the effectiveness of treating chemically dependent physicians. This paper provides an overview of the Physicians' Health Program of the Medical Society of New Jersey; details the current status of physicians treated for chemical dependency from 1982 to 1990; lists the perceived reasons for successful recovery; and identifies the needs for the future.

The Physicians' Health Program of the Medical Society of New Jersey was originally established as a volunteer impaired physicians committee in 1976. In September of 1982, the medical society realized that a volunteer committee program was inadequate to appropriately deal with the problem of physician impairment. A full-time medical director was hired with secretarial staffing. Dr. David I. Canavan was the first full-time medical director of a state medical society impaired physicians program. In 1988, the name of the program was changed from the Impaired Physicians' Program to the Physicians' Health Program (PHP) for functional and political reasons.

The categories of programmatic involvement offered by the PHP include services to any physician who lives, works, or is licensed in New Jersey (including M.D., D.O., V.M.D./D.V.M., and D.P.M.), New Jersey medical students, and physicians' family members. Resident physicians are provided the same services as other program participants, although special considerations are made during this level of training to accommodate their schedules. Some of these accommodations include having PHP staff visit resident physicians at their hospital during times when the residents will not be required to be at rounds or lectures and arranging for urine monitoring in the resident physicians' hospital rather than at a location that would require travel.

Confidentiality is offered to all program participants under the umbrella of the federal regulations on confidentiality of alcohol and drug abuse records (42 CFR Part 2). The only exception to this procedure is if a physician is actively impaired *and* is continuing to practice and is refusing appropriate treatment. If a physician is in monitored recovery and is not a danger to patients, the program follows the federal regulations, which forbid the program from disclosing information unless there is a signed release or a court order. A subpoena for information cannot force the program to release information.

The treatment and recovery orientation of the PHP rather than the

disciplinary and control orientation of the State Board of Medical Examiners may explain why the majority of the PHP's referrals for the past nine years have been from colleagues (over 50 percent), self-reports (20 percent), or from family members (15 percent). Very few of our referrals have been initiated by the State Board of Medical Examiners. The state board tends to identify late-stage impaired physicians whose dysfunctional behavior is symptomatic of their disease. The vast majority of PHP participants are not known to the board. In most of our program participants, the disease was arrested during early or middle stages, and professional impairment was not a factor even though individuals may have been personally impaired. By the time the professional impairment is identified by the State Board of Medical Examiners or the Drug Enforcement Agency (DEA), many physicians have already been in recovery for one or more years. The bureaucratic lag-time gives a chance for recovering physicians to document ongoing recovery prior to appearing before the board.

Over the course of the past nine years, 90 percent of PHP participants have been male and 10 percent female. The division of program participants by medical degree is seen in Table 1. Table 2 summarizes the variety of presenting diagnoses at the time of intake.

Treatment

The PHP uses a variety of treatment modalities for chemically dependent physicians contingent upon individual circumstances. The modalities include

1. twelve-step self-help groups (which are based on the Alcoholics Anonymous model) as either primary treatment (usually for early-stage dependency) or as part of ongoing care after primary treatment;

Table 1. Program participants by medical degree

TOTAL	588	100.0

2. structured outpatient care as primary treatment or as posttreatment aftercare (when used as primary treatment, it is usually an intensive outpatient program);
3. medical detoxification as primary treatment, provided it is followed up with outpatient or residential treatment;
4. short-term residential treatment (4–6 weeks) followed by aftercare and self-help groups;
5. long-term residential treatment (4–12 months) for those experiencing multiple relapses;
6. structured halfway-house treatment, which is an alternative to long-term residential care; and
7. individualized counseling by PHP staff, plus twelve-step self-help group participation. Because this is an informal approach to treatment and recovery, the medical director must give approval for this modality to be used as primary treatment.

Individualized treatment planning allows for a wide variety of treatment options. PHP staff establish the minimum levels of treatment intensity. If a relapse occurs, a more intensive level of treatment is prescribed.

An important treatment consideration is that of third-party coverage. Some physicians do not carry health insurance, making it difficult to procure the optimal treatment. Other physicians, usually those employed in corporate medicine, are covered by health maintenance organizations, making it difficult or impossible to get appropriate treatment paid for by the third party. The PHP has developed a treatment loan fund and a grant fund to assist physicians who do not have appropriate or adequate third-party coverage.

Most physicians are treated in programs that are not physician-only programs. Physicians usually do well in treatment with nonphysicians. Integrated treatment programs allow physicians to focus on their primary disease rather than emphasizing their professional training. There are instances, however, when physician-only programs are valuable, such as in cases when a physician has multiple relapses, or when a physician is unable to separate his or her personal identity from his or her professional identity.

Current status of recovery

A survey of the current status of physicians who participated in the PHP during its first nine years was completed September 6, 1991. The survey included only those physicians with a primary diagnosis of chemical dependency. We did include those who had moved out of state and who

1. had stable recovery at the time of transfer to the other state;
2. continued to be monitored by the PHP or the state licensing board, and for whom we received periodic reports concerning recovery and relapse; and
3. periodically returned to New Jersey to visit the PHP or keep some telephone contact with the PHP (self-report).

The survey specifically excluded

1. those with a significant dual diagnosis that required more complicated treatment and recovery plans;

2. those who had died before the conduct of the survey; and
3. those who were initially referred for chemical abuse but who
 - a. were found not to be chemically dependent (e.g., no formal diagnosis was made);
 - b. were found to have a different diagnosis than the presenting problem; or
 - c. for whom we had inadequate and inappropriate information or misinformation; and
4. those who were lost to follow-up.

Limitations and shortcomings

This survey was not a scientific study but simply a survey based on clinical experience. The PHP's experience of relapse is based on the following:

1. **Self-report of alcohol/drug use.** (In this survey, we have not distinguished between a slip and a relapse.)
2. **Positive urine test result** based on random urine screens conducted within twenty-four hours of notification. The normal protocol includes eight to ten random screens per month for the first six months; six to eight random screens per month for the second six months; and four to six random screens per month for the next twelve months. After the second year, frequency is reduced to two times per month; quarterly; two times per year; and one to two times per year, based on the decision of the medical director. Random urine testing is done with clients having a history of drug use other than alcohol.
3. **Reports from others** that require verification by the PHP staff. These reports may come from family, employers, coworkers, or others.

Two-year follow-up

After two years of program involvement (Table 3), we have seen a recovery rate of 83.8 percent with no relapses. If we include those who had one relapse (13.8 percent), we see a success rate of 97.5 percent. It should be noted that in the field of chemical dependency treatment, a posttreatment re-

lapse is not unusual. It is often considered helpful to long-term sobriety and recovery.

Nine-year follow-up

The nine-year follow-up survey results (Table 4) show 73.8 percent of the physicians had no known relapses and 12.6 percent had only one relapse. Using a commonly held principle that one relapse can be helpful to long-term recovery, we see that, overall, 86.4 percent of physicians can be considered successfully rehabilitated with no relapses or only one relapse. Every year showed better than an 80 percent success rate, with the exception of 1984 (76 percent), if we include the one-relapse experiences over the course of the nine years.

Multiple relapses

It should be noted that due to close monitoring, those with two or more relapses (less than 14 percent) have been confronted about their relapse, have had their treatment intensified or reinstated with renewed intensive monitoring, and have been returned to the ranks of practicing physicians. It is a rare experience for PHP to have program participants who experience multiple relapses necessitating permanent revoca-

* Program began September 6, 1982 (only 4 months of intakes).

** The last 3 months of intakes were 1-3 months short of a full year of program involvement at the time of this survey.

+ Five of the 32 were not included in this survey (deceased, treatment refused, or currently out of medicine).

++ In 1983, 2 of the 35 were not included in this survey (deceased, treatment refused, or currently out of medicine).

+++ The total of chemically dependent intakes includes the 7 from 1982 and 1983 who were not included in this survey.

tion of license due to active chemical dependency. There may, however, be suspension of practice during extended residential treatment (four months to one year) or during posttreatment so as to document abstinence and recovery. These cases are almost always monitored by the State Board of Medical Examiners. In all cases, physicians who have active chemical dependency and attempt to practice medicine while refusing treatment and monitoring will be reported to the State Board of Medical Examiners with a recommendation for license suspension until recovery is adequately documented.

Reasons for high success rate

The reasons for such a high rate include

1. formal, structured, outpatient aftercare counseling (post-inpatient treatment) that continues for one to two years in most cases;
2. a highly structured urine monitoring program, which is used to identify early relapse and document abstinence; and
3. personal/face-to-face contact with PHP staff. (During the first year, there is a minimum of monthly visits, followed by every other month visits during the second year. During the third year, there are visits every third month; during the fourth year, every four months; and during the fifth year, every six months, after which annual visits are the norm as long as the physician is practicing or living in New Jersey.)

The personal visits with the PHP staff provide a number of benefits. Among them are

1. The development of a personal relationship with someone who can be perceived as an advocate and friend as well as monitor. (Appearances before the State Board of Medical Examiners include one of our staff, with documentation of recovery, literally sitting beside the physician.)
2. The provision of a person other than the aftercare counselor to whom the physician can complain when conflicts arise. (In this case, a PHP staffperson may act as a mediator of treatment disputes or the equivalent of a patient advocate. It should be noted that physicians are not permitted to unilaterally withdraw from treatment; the approval of the PHP is necessary for the termination of treatment or for the changing of aftercare therapists.)
3. The provision of regular monitoring of treatment and recovery plans. (The PHP staff make sure self-help group meetings are actively included in the recovery plan as well as in the formal therapy.)
4. Ongoing assessment of the case and updating of the treatment plan, including the easing-up or tightening-up of the recovery plan.
5. The opportunity for staff to visit with the program participant in an environment comfortable to the physician (e.g., office, hospital, coffee shop, diner, home).
6. The opportunity for timely crisis counseling on critical issues related to ongoing recovery, especially after formal counseling has been terminated.

Comparative studies

Finney and Moose¹ published a ten-year study of 113 general population alcoholics who were interviewed two years after treatment and again eight years after treatment. The study's definition of remission included not being re-hospitalized or missing work because of alcoholism in the two years prior to the study. To be considered in remission, study participants had to have drunk less than 3 ounces per day on average and less than 5 ounces per drinking day in the previous month. Additionally, they had to have had no drinking-related problems in the previous year except for family arguments. It should be noted that this study did not expect abstinence nor require an aftercare treatment plan. Based on this concept of remission, 57 percent were in remission two years after treatment, and 46 percent were in remission between two and six years after conclusion of treatment. If we were to exclude those who had returned to drinking, the remission rate would be significantly lower.

A more relevant study conducted at the Mayo Clinic compared physicians and nonphysicians after a more traditional four-week, abstinence-oriented program that included a recommendation for twelve-step self-help support groups.² In this study, the researchers found that after two years, the recovering members of the population studied showed an abstinence rate of 83 percent. The study further divided the physician population by chemical of abuse. Those who had been dependent on alcohol had a recovery rate of only 83 percent. Those dependent on drugs other than alcohol had a recovery rate of 94 percent. Those who were dependent on alcohol and other drugs (mixed dependencies) experienced a success rate of only 62 percent. On average, the physicians in this study had a success rate of 83 percent two years after initial treatment. The nonphysicians in the survey experienced an average recovery rate of 57 percent.

The New Jersey survey described in this paper (Table 3), showed a no-relapse rate of 83.3 percent at two-year follow-up. If the one-relapse cases are included, the success rate rises to 97.6 percent. Table 5 compares these three studies.

Successful treatment of chemical dependency in the general population as well as within special populations is in need of a common definition. The New Jersey survey described successful cases based upon known relapses as they relate to the use of mood-altering drugs. Relapses were determined by self-reports (which are reliable only among those who do self-report; self-reports are far from ideal if denial is active); reports from others such as family and coworkers (which are

Table 5. Comparison of two-year success rates

Study	Nonphysicians	Physicians
Ten-year study of 113 general population alcoholics ¹	57%	Not surveyed
Mayo Clinic study comparing physician and nonphysician substance users ²	62%	83%
Nine-year study of physicians in New Jersey's Physicians' Health Program	Not surveyed	83.8% (no relapse) 13.8% (1 relapse) 97.6% (total)

reliable only to the degree that denial has been broken in the family and in the professional community); urine monitoring, which is the most objective documentation available when done properly (random and witnessed); and staff assessment. While the New Jersey survey used both subjective and objective tools, all have their shortcomings.

Due to lack of research staff, we have only been able to do a survey of the current status of our physician-clients. A more comprehensive study should include the following:

1. assessment of family health and stability;
2. assessment of professional performance since treatment (This should not be considered a function of the PHP since programs are not and should not be responsible for professional competence; but successfully recovering physicians should maintain at least professionally acceptable levels of competence. This assessment could include ongoing education and certification by specialty boards.);
3. client self-evaluation of recovery status (physical, emotional, social, professional, spiritual);
4. drug testing, not only random witnessed urine screening, but possibly the use of hair analysis (once its validity has been verified);
5. assessment of the physician's ability to balance professional, personal, and family life; and
6. recovery assessment by an independent medical professional not affiliated with a treatment center.

It is important to recognize that health recovery cannot be limited to abstinence from mood-altering drugs, although this is one major component. Assessment of successful recovery must be addressed by both subjective and objective methods that include the internal (client self-perception of treatment and recovery) and the external evaluative tools listed above.

NEW INDICATION

ONLY ONE H₂-ANTAGONIST HEALS REFLUX ESOPHAGITIS AT DUODENAL ULCER DOSAGE. ONLY ONE.

Of all the H₂-receptor antagonists, only Axid heals and relieves reflux esophagitis at its standard duodenal ulcer dosage. Axid, **150** mg b.i.d., relieves heartburn in **86%** of patients after one day and **93%** after one week.¹

AXID[®]
nizatidine
150 mg b.i.d.

ACID TESTED. PATIENT PROVEN.

AXID[®] nizatidine capsules

Brief Summary. Consult the package insert for complete prescribing information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to 8 weeks of treatment at a dosage of 300 mg h.s. or 150 mg b.i.d. Most patients heal within 4 weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a dosage of 150 mg h.s. at bedtime. The consequences of therapy with Axid for longer than 1 year are not known.

3. *Gastroesophageal reflux disease (GERD)*—for up to 12 weeks of treatment of endoscopically diagnosed esophagitis, including erosive and ulcerative esophagitis, and associated heartburn at a dosage of 150 mg b.i.d.

Contraindication: Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H₂-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H₂-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix[®] may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chloridazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Worldwide, controlled clinical trials included over 6,000 patients given nizatidine in studies of varying durations. Placebo-controlled trials in the United States and Canada included over 2,600 patients given nizatidine and over 1,700 given placebo. Among the adverse events in these placebo-controlled trials, only anemia (0.2% vs 0%) and urticaria (0.5% vs 0.1%) were significantly more common in the nizatidine group. Of the adverse events that occurred at a frequency of 1% or more, there was no statistically significant difference between Axid and placebo in the incidence of any of these events (see package insert for complete information). A variety of less common events were also reported; it was not possible to determine whether these were caused by nizatidine.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of anti-androgenic activity due to nizatidine. Impotence and decreased libido were reported with similar frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Anemia was reported significantly more frequently in nizatidine than in placebo-treated patients. Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H₂-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Urticaria was reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H₂-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. The ability of hemodialysis to remove nizatidine from the body has not been conclusively demonstrated; however, due to its large volume of distribution, nizatidine is not expected to be efficiently removed from the body by this method. Postoperative follow-up of patients with colorectal cancer

The goal of a follow-up program after curative surgery should be to look for second primary tumors or metastatic disease by using those testing modalities that detect disease in its earliest state, presumably when it is more likely to be cured by intervention. The decision to use a particular test or group of tests after curative surgery for colorectal malignancies has become more difficult with the advent of new modalities ranging in technological complexity from history and physical examination to imaging studies. Naturally, there is also a wide range of costs associated with these various tests that must also be taken into account. Thus, in developing a follow-up program, one must account for the biologic behavior of the disease as well as the sensitivity/specificity of the various testing modalities. Historically, one of the earliest approaches to an organized follow-up was promoted by Wangensteen in 1951 who suggested routine second-look laparotomies. However, the yield from these procedures was low and the procedure was abandoned.

In a prospective study of sixty-six patients at high risk for recurrence after resection of colorectal malignancies at the National Cancer Institute (NCI), Sugarbaker and coworkers¹ used a battery of tests including history and physical examination, carcinoembryonic antigen (CEA) level, computed tomography (CT) scan of the abdomen, full lung tomography, liver/spleen scintigraphy, intravenous pyelogram, barium enema, and bone scintigraphy. With a mean follow-up of 4.5 years, they documented thirty-three patients with recurrent disease. CEA assay was found to be the most useful study, being the first positive test in 67 percent of patients with recurrence. Physical examination was the first positive test in another 21 percent of patients with recurrence. The researchers also found that 60 percent of all recurrences were at more than one anatomic site at the time of diagnosis. Only 15 percent of patients with recurrence had isolated distant metastatic disease, with just 3 percent having an isolated pulmonary recurrence. In this study, 85 percent of patients with recurrent disease were diagnosed within thirty months of their primary operation. The researchers concluded that the most useful postoperative tests are limited to history and physical examination and CEA assay. Other workers² have carefully reviewed the literature, concluding that CT scan of the abdomen, chest x-ray, intravenous pyelogram, barium enema, liver scintigraphy, fecal occult blood tests, and liver function tests have an extremely low yield and are not necessary in the follow-up of patients after resection of colorectal malignancies. In the NCI study,¹ fecal occult blood tests and liver function tests did not detect recurrence in any patient.

History and physical examination should be thorough, including special attention to symptoms such as sacral pain, urologic complaints, and vaginal bleeding. Symptoms of bone pain, altered bowel habits, and weight loss are also important.

Physical examination should be directed at identifying supraclavicular adenopathy, abdominal masses, and organomegaly.

CEA assay is the other important component of the follow-up program. A rising CEA level was found to signal recurrent disease an average of 2.5 months earlier than clinical findings.² CEA data are being evaluated in new ways, including looking at the rate of rise (slope) of CEA as a way to predict which patients truly have recurrent disease. In addition, a benefit has been reported from checking CEA levels every one to two months compared with less frequently.² It must be remembered that not all tumors produce CEA, which explains an overall 40 percent sensitivity in patients with primary lesions. The sensitivity is related to the stage of disease; CEA assay in patients having stage IV disease (Dukes D) is 85 percent sensitive. The specificity is decreased by the fact that a number of disease states can lead to an elevated CEA, including breast tumors, other gastrointestinal malignancies, and a number of benign conditions such as renal failure, biliary disease, and tobacco abuse. It must also be remembered that a normal CEA does not exclude the possibility of persistent disease, local recurrence, or distant metastatic disease.²

Colonoscopy is an important part of the follow-up program; its use limited to that of identifying new primary lesions. It has been shown in a number of studies² that the chances of identifying a metachronous tumor are greatest in the first three years following definitive treatment of the primary tumor.

Therefore, based on currently available data, a reasonable follow-up program for patients after resection of a primary colorectal malignancy includes

1. History and physical examination performed every three months for three years, then every six months for two years, then annually.
2. CEA level determined every two months for three years, then every three months for two years, then annually.
3. Colonoscopy performed preoperatively or within one year of surgery, then annually for three years, then every three years.

The cost for this follow-up program would be \$2,683 over five years.

A positive study requires further action. If the CEA is positive, it should be repeated. A persistent elevation requires testing directed at common sites of recurrence. One should then obtain CT scans of the chest and abdomen/pelvis, liver function tests, a bone scintigram in the presence of bone pain, and colonoscopy. If all of these are negative, renal disease, breast malignancy, lung cancer, other gastrointestinal tumors, and hepatic dysfunction must be ruled out. At present, the only curative therapy for patients with recurrent disease is further surgery.¹

In the future, follow-up protocols may include the use of specific monoclonal antibodies (injected with a radionuclide and scanned) with intraoperative tumor localization and follow-up programs stratified by other variables (e.g., tumor ploidy, stage of the primary). It is hoped that with the development of new adjuvant treatments, the outlook for patients with recurrent disease will improve. Until then, we must be vigilant to identify disease in its earliest and, it is hoped, its most curable state.

Assistant Professor of Surgery and Oncology
University of Maryland School of Medicine

Tumor conferences are held weekly on Tuesday between 8 and 9 a.m. in Room NBW74 at the University of Maryland Medical System. Physicians are welcome to attend this open meeting and to present cases and pathology slides. Call 410-328-5224 by noon Monday to be placed on the schedule: Surgical Oncology Program, University of Maryland Medical System, Room N13E02, Baltimore, MD 21201.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Should children with diabetes go to camp?

Doctor, our Tommy is eight years old and has had diabetes for one year. At first he was very cooperative about following his meal plan and monitoring his blood glucose. Recently he has become stubborn about testing and he is begging food that he should not have from the neighbors. He wants to go away to camp this year, but since he can't get his diabetic management back on schedule even with our support and guidance, should we allow him to go away to camp?

Camps for diabetic children exist all over the United States for the problems that confront Tommy and his parents. About thirty years ago, Dr. Abraham Silver almost single-handedly began such a camp in Maryland—Camp Glyndon. It has become one of the finest camps of its kind in the country.

Camp Glyndon, which is accredited by the American Camping Association, is located in Glyndon, Maryland. Its primary purpose is to educate children with diabetes so they can have a thorough understanding of their problem while enjoying the fun and excitement of a normal camp setting.

It is recommended that all children having diabetes get the experience of living and playing with other children having a similar problem.

The camping session schedule for 1992 is as follows:

Session I	June 28-July 10	Ages 13-15
Session II	July 12-July 17	Family I
Session III	July 19-July 31	Ages 10-12
Session IV	August 2-August 7	Family II
Session V	August 9-August 14	Ages 10-12
Session VI	August 16-August 21	Ages 7-9

Attendance at other summer camps such as church-related camps, YMCA/YWCA camps, or scout camps may also be used as a camping experience if adequate health care support is available at those facilities. However, it would be desirable to have children with diabetes attend those camps *in addition* to Camp Glyndon or in alternate years with a diabetic camp.

For more information and an application for Camp Glyndon contact

Auxiliary

Charles Ballard Senior Health Center

The Charles Ballard Senior Health Center is, to our knowledge, the first medical auxiliary project of its kind in Maryland—perhaps in the nation. The concept originated with the Auxiliary to the Anne Arundel Medical Society, which recognized that health education could have a positive impact on the utilization of health services and on community relations.

Health education not only provides information, offers guidance, and prevents health problems, but it can also enhance the physician/patient relationship. The Ballard Center offers physicians the opportunity to improve communication between the medical and senior citizen communities. Mutual respect and understanding are by-products of this communication. The senior participants become more aware of how to improve their mental and physical capabilities and are motivated to be active and enthusiastic partners in their health care.

The purpose of the center is to provide a broad program of primary health guidance in a recreational and social environment. The center also offers health education to the elderly and provides a link between the elderly and treatment recommended by the medical community.

History

- In November 1982, the Auxiliary to the Anne Arundel County Medical Society met with the director of the Office of Aging for the City of Annapolis regarding the possibility of opening a health center for the elderly in Anne Arundel County.
- In February 1983, a founding committee comprised of auxiliary members defined the center's purpose and outlined plans for implementation of a program. The center was named for a respected spokesman, Charles Ballard, who lobbied in the county and state legislature, and championed many problems faced by the senior community.
- After approval by the Anne Arundel County Medical Society in March 1983, the founding committee met with local hospital, city, and county representatives to assess available resources. An Advisory Board of

Community Representatives and a Board of Directors comprised of auxiliary members were formed.

- On April 21, 1983, the center opened to the public. Free programs were offered each Friday morning, September through June, for all seniors age fifty-five and over. A Charles Ballard Fund was established to support the center's operation; the retired Naval Academy chaplains contribute to this fund.

Today

The Charles Ballard Senior Health Center now has well over a hundred members. On Fridays, a speaker from the medical community presents topics on health care, prevention, and primary health guidance. The center also offers health screenings. These activities have resulted in a group of well-informed medical consumers. On Tuesdays and Fridays, there are aerobic exercise classes with Auxilian Sally Linhardt, and on Wednesdays, line dancing is led by Melvina Reese.

In October 1991, the Ballard Center members also acted as hostesses for the Annual Senior Health Fair held at the Annapolis Mall.

This past Christmas, there was a combined Christmas party with the children of the members of the Anne Arundel Medical Society and the members of the Charles Ballard Senior Health Center. The benefits were donated to Sarah's House, a facility for homeless families.

ELLENOR ALVAREZ

Director of the Charles Ballard Senior Health Center

Seniors participate in aerobics and line dancing.

Board of Physician Quality Assurance Actions

**In the matter of
Oscar J. Jackson
before the
Maryland Board of
Physician Quality Assurance
Order terminating probation**

By order dated November 1, 1983 (the 1983 order), the Commission on Medical Discipline (the commission), predecessor agency to the Board of Physician Quality Assurance (the board), found Oscar J. Jackson, M.D. (the respondent) guilty of committing prohibited acts as set forth in Health Occupations Article, *Annotated Code of Maryland* (HO) §14-504. Specifically, the commission found respondent guilty of being disciplined by a licensing or disciplinary authority, or convicted or disciplined by a court of any state or country, or disciplined by any branch or the United States uniformed services or the Veterans' Administration for an act that would be grounds for disciplinary action under this section. The commission revoked the respondent's license, stayed the revocation, and placed respondent on probation subject to conditions of the December 24, 1983 order of the California board. The order further provided that when the respondent could provide written evidence to the commission that respondent had completed all the probationary terms imposed by the California board, the commission would entertain a petition for termination of respondent's probationary status and reinstatement of his medical license. By letter dated December 30, 1988 and received by the board on January 4, 1989, the board reviewed respondent's petition for reinstatement. At its meeting on September 26, 1990, the board determined that respondent had fulfilled the conditions of probation contained in the 1983 order.

Finding of fact

Based on the information known and available to it, the board finds that

1. Respondent met all the conditions of the California board's order.

Conclusions of law

The board concludes, as a matter of law, that respondent has satisfactorily complied with all conditions of probation as set forth in the order of November 1, 1983.

Order

Upon the foregoing findings of fact and conclusions of law, it is this 26th day of September 1990 by a majority vote of the full authorized membership of the board

ORDERED, that effective as of the date of this order, the conditions of probation imposed upon respondent's practice of medicine by the board's 1983 order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED, that respondent shall give the board written

notice of any intention to commence the active practice of medicine in the state of Maryland; and be it further

ORDERED, that this is a final order and as such is considered a public document pursuant to the Maryland Public Information Article, State Government Article, *Annotated Code of Maryland*, §§10-611 *et seq.*, specifically §10-617(h)(2)(vi).

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

**In the matter of
Ernest A. Leipold, M.D.
before the
Maryland Board of
Physician Quality Assurance**

Surrender of license

Dear Dr. Weiner and members of the board:

Please be advised that I have decided to surrender my license to practice medicine in Maryland. I understand that I may apply for reinstatement of my license after I meet certain requirements which are described in this letter of surrender. Therefore, my decision to surrender my license is REVOCABLE.

I understand that this letter of surrender will be considered a PUBLIC document.

On July 24, 1991, the Board of Physician Quality Assurance (the board) voted to summarily suspend my medical license and charge me pursuant to *Md. Health Occ. Code Ann.* §14-404(a)(2), (8), (9), and (28) (1991 replacement volume). Sections 14-404(a)(2), (8), (9), and (28) provide in pertinent part

Subject to the hearing provisions of §14-405 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

- (2) Fraudulently or deceptively uses a license;
- (8) Is addicted to, or habitually abuses, any narcotic or controlled dangerous substance as defined in Article 27 of the *Code*;
- (9) Provides professional services
 - (i) While under the influence of alcohol; or
 - (ii) While using any narcotic or controlled dangerous substance, as defined in Article 27 of the *Code*, or other drug that is in excess of therapeutic amounts or without valid medical indication; and
- (28) Sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes.

The board also voted that if I surrendered my license it would not proceed to issue either the charges or the summary suspension. Prior to the issuance of charges against me, I advised my attorney, Thomas G. Ross, Esquire, and the board, that I wished to voluntarily surrender my license to the board. Consequently, my decision to surrender my license will result

Board of Physician Quality Assurance Actions

in the board's rescinding its vote to charge me and summarily suspend my license.

My decision to surrender my license and discontinue the practice of medicine has been prompted by my desire to avoid being charged under the Maryland Medical Practice Act, *Md. Health Occ. Code Ann.* §14-404 (1991 replacement volume). The basis of the summary suspension and charges against me is information obtained by the board regarding an investigation which led to my arrest on July 23, 1991. The board was provided information by the Maryland State Police, the Caroline County Drug Task Force, and the Drug Enforcement Administration concerning my alleged possession and distribution of controlled dangerous substances. The Maryland State Police charged me on July 23, 1991 in the District Court of Maryland for Queen Anne's County in *State of Maryland v Ernest A. Leipold* tracking number 001400M0. In the above captioned case, I am charged with six counts of distribution of a controlled dangerous substance, six counts of possession of a controlled dangerous substance and two counts of possession of drug paraphernalia. I understand that the information obtained in the criminal investigation of me is the basis of the summary suspension and charges voted against me by the board pursuant to the Maryland Medical Practice Act.

I understand that this letter of surrender shall become a public document and shall become effective immediately upon its acceptance by the board, that date being the date on which the board approves this letter of surrender.

I further understand that the surrender of my license to practice medicine in the state of Maryland shall stay in effect pending the resolution of all criminal charges against me in the state of Maryland. In the event that the criminal charges against me in the District Court of Maryland for Queen Anne's County are dismissed, this surrender will remain in effect until the case is considered by the Grand Jury for Queen Anne's County, Maryland. If I am indicted, or charged by criminal information in the Circuit Court for Queen Anne's County, this surrender will remain in effect until the resolution of that indictment or criminal information.

After the resolution of all charges stemming from the criminal investigation which resulted in my arrest on July 23, 1991, I may petition the board for reinstatement of my license to practice medicine in the state of Maryland. I understand that the board may take into account the actions of the Maryland criminal courts in making a determination of whether to reinstate my license to practice medicine in the state of Maryland.

I have not practiced medicine in Maryland since July 24, 1991. I hereby affirm that I do not have any hospital privileges in Maryland, or any other state in the United States. I am not licensed to practice medicine in any other state of the United States of America or any other country.

I agree to sign DEA Form 104, Voluntary Surrender of Controlled Substances Privileges. I acknowledge that the board will send my DEA registration certificate, DEA form

104, and a copy of this letter of surrender to Robert Bickel, group supervisor, DEA, 31 Hopkins Plaza, Room 955, Baltimore, Maryland 21201.

I hereby affirm that I do not have any DEA order forms for schedule I or II drugs.

I acknowledge that the board will send my Maryland CDS registration certificate and a copy of this letter of surrender to Charles Tregoe, chief, Division of Drug Control, 4201 Patterson Avenue, Baltimore, Maryland 21215.

Before the board accepts this letter of surrender as a resolution of case number 92-0009, I must present to the board the following:

1. Maryland license D06685, renewal certificate, and wallet-size renewal card.
2. United States Drug Enforcement Administration Registration Certificate AL9355757, which permits me to prescribe controlled dangerous substances in Maryland, and DEA form 104.
3. Maryland Controlled Dangerous Substances Registration Certificate #M17425 issued by the Maryland Division of Drug Control.
4. All prescription pads in my possession or control.
5. All controlled substances in my possession or control other than those that are prescribed to me by another licensed physician.

In executing this letter of surrender, I understand that I may apply for reinstatement of my license to practice medicine in Maryland upon the final resolution of the case known as *State of Maryland v Ernest A. Leipold* presently before the District Court of Maryland for Queen Anne's County. If I apply for reinstatement of my license I acknowledge that I bear the burden of demonstrating to the board that I am competent to practice medicine. I understand that the board will require a statement from my treating physician which states that he or she believes I am competent to practice medicine. I further understand that the board may require an independent psychiatric evaluation of me prior to deciding whether to reinstate my license. I understand that the board may consider the independent psychiatric evaluation of me in deciding whether to reinstate my medical license.

Further, I understand that I must demonstrate that I have the cognitive and clinical competence to practice medicine. Additionally, I must demonstrate that I have taken fifty continuing medical education hours applicable to the field of medicine I wish to enter, for each year I have not practiced. I further understand that the board may require that I be appropriately evaluated for clinical competence prior to my reinstatement. I understand that I must demonstrate to the board's satisfaction that I possess good moral character as specified in *Md. Health Occ. Code Ann.* §14-307(b) (1991 replacement volume).

Until the board grants my request for reinstatement, I understand that I may not give medical advice to any individual, for compensation or otherwise, and cannot prescribe

Board of Physician Quality Assurance Actions

medication. In other words, I understand that the surrender of my license means that I am an unlicensed physician.

Finally, I wish to make clear that I have consulted with an attorney before signing this REVOCABLE letter of surrender of my license to practice medicine in the state of Maryland. I understand the nature of the board's actions and this letter of surrender fully. I make this decision knowingly and voluntarily. My action, by virtue of this letter, is not intended to be, nor should it be construed as, an admission of any guilt on my part to any allegations of wrongdoing made in the criminal charges against me or contemplated by the Board of Physician Quality Assurance.

ERNEST A. LEIPOLD, M.D.

On behalf of the Board of Physician Quality Assurance, on this 13th day of August, I accept Ernest A. Leipold, M.D.'s PUBLIC REVOCABLE surrender of his license to practice medicine in Maryland.

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

■ ■ ■
In the matter of
Bautista Perez-Sanz, M.D.
before the
Maryland Board of
Physician Quality Assurance
Final order

Based on information received by the Board of Physician Quality Assurance of the state of Maryland (the board), the board charged Bautista Perez-Sanz (respondent) on June 11, 1991 under the Maryland Medical Practice Act (the act), *Md. Health Occ. Code Ann. Section 14-401 et seq.*

The pertinent provisions of the act are as follows:

Section 14-404. Denials, reprimands, probations, suspension, and revocations—Grounds.

(a) In general. Subject to the hearing provisions of section 14-405 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

(21) Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state or country or disciplined by any branch of the United States uniformed services or the Veterans' Administration for an act that would be grounds for disciplinary action under this section;

The grounds underlying the charges of this section are that respondent

(3) Is guilty of immoral or unprofessional conduct in the practice of medicine.

(22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality

medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state.

The board notified respondent that if respondent did not request a hearing, the board would issue this final order.

Based on clear and convincing evidence, the board, on the affirmative vote of a majority of its full authorized membership considering this case, issues this final order.

Findings of fact

A. The board finds as follows:

1. At all times relevant to these charges, the respondent was and is licensed to practice medicine in the state of Maryland;
2. The respondent was notified by the board on June 4, 1991 of charges filed against him and that the board could sanction respondent as a result of these charges;
3. The respondent was informed that this final order would be executed thirty days from the respondent's receipt of the board's notification, unless respondent requested a hearing;
4. Respondent received the board's charges and notice of intent to sanction under the Maryland Practice Act on June 24, 1991.
5. Respondent had to request a hearing by July 24, 1991, in order for the board not to execute this Final Order;
6. Respondent did not request a hearing by July 24, 1991.

B. The board further finds that

1. Appropriate peer review includes the review of a physician's practice by a licensing or disciplinary authority of another jurisdiction.
2. On October 13, 1989, respondent entered into a consent order (the order) with the Department of Health of the State Board of Professional Medical Conduct of the State of New York, Exhibit 1, in which respondent admitted guilt to failing to maintain adequate medical records and ordering excessive treatment;
3. In his consent order of October 13, 1989, respondent agreed that his

License to practice as a physician in the state of New York be suspended for a period of two years, that execution of the last one year, ten months, and fifteen days be stayed, at which time I [respondent] be placed on probation for one year, ten months, and fifteen days under the terms set forth in the exhibit marked as Exhibit B;

4. Failing to maintain adequate records is a failure to meet appropriate standards of care;
5. Failing to maintain adequate records is unprofessional conduct in the practice of medicine.
6. Ordering excessive treatment is a failure to meet appropriate standards of care;
7. Ordering excessive treatment is unprofessional conduct in the practice of medicine.

Board of Physician Quality Assurance Actions

8. Suspension of respondent's license and being placed on probation by the Department of Health of the State Board of Professional Medical Conduct of the State of New York is being disciplined by a licensing or disciplinary authority.

Conclusions of law

Respondent committed the following prohibited acts:

1. Respondent was disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state or country or disciplined by any branch of the United States uniformed services or the Veterans' Administration for an act that would be grounds for disciplinary action under this section [*Md. Health Occ. Code Ann.* Section 14-404 (a) (21)]
2. The underlying grounds for this disciplinary action were respondent's failure to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state [*Md. Health Occ. Code Ann.* Section 14-404 (a) (22)], and that respondent was guilty of immoral or unprofessional conduct in the practice of medicine [*Md. Health Occ. Code Ann.* Section 14-404 (a) (3)].

Order

It is this 13th day of August 1991, by an affirmative vote of a majority of the full authorized membership of those members of the board who considered this case,

ORDERED, that respondent's license to practice medicine in the state of Maryland (the state) is **SUSPENDED**. Said suspension is **STAYED** provided that respondent complies with the following conditions of probation:

1. Respondent must comply with all conditions of his probation with the state of New York as set forth in Exhibit 1; and
2. Respondent shall not practice medicine in the state of Maryland until respondent appears before a settlement conference of the board and obtains the approval of the board;

and be it further

ORDERED, that upon satisfactory completion of the requirements of the terms of his probation with the state of Maryland, respondent may petition the board for reinstatement of his license in Maryland without any conditions; and be it further

ORDERED, that the stay of respondent's suspension shall be lifted if respondent fails to comply with any of the terms of this final order; and be it further

ORDERED, that this is a final order and as such will be considered a public document pursuant to *Md. State Gov't Code Ann.* Section 10-611 *et seq* (1989 Cum. Supp.).

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Notice of right to appeal

Pursuant to *Md. Health Occ. Code Ann.* Section 14-408 (b) (1991) there is a right to take a direct judicial appeal. Any appeal shall be made as provided for in judicial review of a final decision in the Administrative Procedure Act, State Government Article, and the B Rules of Maryland Procedure, 1991.

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

In the matter of
Cleveland Williams, M.D.
before the
Maryland Board of
Physician Quality Assurance

Surrender of License

Dear Dr. Weiner and members of the board:

Please be advised that I have decided to surrender my license to practice medicine in the state of Maryland. I understand that I may not give medical advice or treatment to any individual, with or without compensation, cannot prescribe medications, or otherwise engage in the practice of medicine as it is defined in *Md. Health Occ. Code Ann.* §14-101 (1991 replacement volume). In other words, I understand that surrender of my license means that I am in the same position as an unlicensed individual. This decision to surrender my license to practice medicine in the state of Maryland is **REVOCABLE** and public.

This letter of surrender shall become a public document and shall become effective immediately upon its acceptance by the Board of Physician Quality Assurance (the board), that date being the date on which the board accepts this letter of surrender.

My decision to surrender my license to practice medicine in Maryland has been prompted by an investigation of my practice, which was undertaken in accordance with the consent order reached between myself and the Commission on Medical Discipline, dated June 21, 1988. This investigation included a review of my practice conducted by the Peer Review Committee of the Medical and Chirurgical Faculty of the State of Maryland. The board's investigation resulted in charges under the Maryland Medical Practice Act (the act). Specifically, the board charged me with the commission of prohibited acts under *Md. Health Occ. Code Ann.* §14-404(a)(22) (1991 replacement volume). Section 14-404(a)(22) provides in pertinent part:

Subject to the hearing provisions of §14-405 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

Board of Physician Quality Assurance Actions

- (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state.

I received a copy of the statement of charges under the Maryland Medical Practice Act as described above, on July 17, 1991. A copy of the statement of charges is included as Appendix A.

I have decided to surrender my license and to discontinue the practice of medicine in Maryland to avoid further prosecution on the aforementioned charges under the Maryland Medical Practice Act. The basis for the charges against me would include the findings of the investigation as described above.

I affirm that I have an office-based practice, located at Suite 103, 1111 Spring Street, Silver Spring, Maryland 20910. I affirm that I will terminate this and any other practice that I have in Maryland upon the acceptance of this letter of surrender by the board. I acknowledge that I have no hospital privileges in Maryland.

I understand that the board will advise the Federation of State Medical Boards and the National Practitioners' Data Bank, as required by Senate bill 99-660, through this letter of surrender, and any response to inquiry, that I have surrendered my license to practice medicine as resolution of the matters pending against me. I also understand that, in the event that I would apply for reinstatement of my license in Maryland, or apply for licensure in any other state or jurisdiction, that this letter of surrender, and all underlying documents, may be released or published by the board to the same extent as a final order which would result from a disciplinary action, under the Public Information Act, State Gov't. Code Ann. §§10-611 *et seq.*

I affirm that I have a current Maryland Controlled Dangerous Substances Registration Certificate M15956, expiration date June 30, 1992, issued by the Maryland Division of Drug Control; and that I have a current United States Drug Enforcement Administration (DEA) Certificate for the State of Maryland. Certificate AW1280332, expiration date May 31, 1992, issued by the DEA.

I acknowledge that, on the date the board accepts this letter of surrender, I must present to the board Maryland License D26740, including any renewal certificates and wallet-sized renewal cards; and Maryland Controlled Dangerous Substances Registration Certificate M15956, including any prescription pads bearing my name and any prescription ordering forms in my possession or under my control.

I agree to sign DEA form 104, voluntary surrender of controlled dangerous substances privileges. I acknowledge that the board will send my DEA registration certificate, DEA form 104, and a copy of this letter of surrender to Kathryn P. Daniels, diversion group supervisor, DEA, 400 6th Street, S.W., Washington, DC 20024.

I acknowledge that the board will send my Maryland Controlled Dangerous Substances Registration Certificate

and a copy of this letter of surrender to Charles H. Tregoe, chief, Division of Drug Control, 4201 Patterson Avenue, Baltimore, Maryland 21215.

I affirm that I have a medical license in the District of Columbia. I acknowledge that, on the date the board accepts this letter of surrender, the board will send a copy of this document to John P. Hopkins, executive director of the District of Columbia Board of Medicine, 605 G Street, N.W., Room 202, Lower Level, Washington, DC 20001.

Finally, I wish to make clear that I have consulted with an attorney before signing this letter SURRENDERING my license to practice medicine in the state of Maryland. I understand both the nature of the board's actions and this letter of surrender fully. I make this decision knowingly and voluntarily.

CLEVELAND WILLIAMS, M.D.

Appendix A

In the matter of
Cleveland Williams, M.D.
before the
Maryland Board of
Physician Quality Assurance

Charges under the Maryland Medical Practice Act

Based on information received by the State Board of Physician Quality Assurance (the board), the board hereby charges Cleveland Williams, M.D. (the respondent) under the Maryland Medical Practice Act (the Act), *Md. Health Occ. Code Ann.* (HO) §14-404(a)(22) (1991 Rep. vol.).

The pertinent provision of the act under HO §14-404 provides the following

- (a) Subject to the hearing provisions of §14-405 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee

- (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state. [See H.O. §14-404(a)(22).]

Allegations of fact

The board bases its charges on the following facts that the board has cause to believe are true:

1. On or about August 3, 1981, the Board of Medical Examiners of the state of Maryland granted respondent a license to practice medicine.
2. On or about March 23, 1988, the Commission on Medical Discipline (CMD) issued a charge letter charging the respondent with violating HO §14-504(3) of the act ("is guilty of immoral conduct in the practice of medicine ..."), in which it was alleged that the respondent misrepresented his qualifications in regard to board certification in obstetrics and gynecology in applying for hospital staff privileges at Washington Adventist Hospital (WAH) and in applying for membership in the patient referral service of the Montgomery County Medical Society (MCMS).

Board of Physician Quality Assurance Actions

3. On or about June 21, 1988, the respondent entered into a consent order with the CMD whereby the CMD withdrew the charge of H.O. §14-504(3) and substituted a charge under §14-504(4), in which it was alleged that the respondent "is professionally, physically, or mentally incompetent." The respondent then admitted that he had violated HO §14-504(4) of the act, in misrepresenting his qualifications in applying for hospital staff privileges at WAH and in forms submitted to the MCMS.
4. As a result of the consent order reached between the respondent and the CMD (as described in paragraph three above), the respondent's license to practice medicine in the state of Maryland was suspended for a period of three years and ninety days; after the first ninety days of the suspension occurred, the suspension was stayed. The respondent was then placed on probation for a period of three years, subject to certain conditions, among which were continued psychiatric treatment, notification of the CMD of any changes in the nature of the respondent's office practice, and periodic peer reviews as necessary.
5. The Peer Review Management Committee of the Medical and Chirurgical Faculty of the State of Maryland (Med Chi) requested that the Peer Review Committee (the PRC) of Med Chi conduct a peer review of the respondent's practice. The PRC of Med Chi referred the matter to Lois E. Wehren, M.D., board certified in obstetrics and gynecology, for peer review.
6. The respondent failed to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care in several areas described in more detail in the individual patient summaries, *infra*. The respondent's medical record charts show a consistent pattern of inadequate documentation, particularly as the records relate to the patient's history and physical examinations. The patient's history often lacks such vital information as the patient's present illness(es), past medical and surgical history, family and social history, and menstrual history. The medical records often do not indicate that breast or pelvic examinations were performed. In those instances where documentation of examinations does exist, the findings of those examinations are not sufficiently detailed. Appropriate laboratory tests are not reliably ordered, nor are abnormal values determined by those tests appropriately treated. The medical records further indicate that the respondent neglected to treat potentially dangerous conditions in his patients, and failed to adequately formulate and document treatment plans in the conditions so diagnosed.

The following deficiencies were found in regard to the following patients:

Patient A

Patient A, a 32-year-old female, sought obstetric care from the respondent on one occasion, April 11, 1990. The patient's last menstrual period (LMP) was October 27, 1989. The patient's estimated date of confinement (EDC) was calculated as July 25, 1990.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent did not document an adequate history of the patient in the patient's medical record. The appropriate standard of medical care requires that the obstetrician-gynecologist (OB/GYN) document an adequate history of the patient in the medical record, which should include, but not be limited to, a

history of present illnesses, past medical history, and family and social history. The medical record fails to contain documentation of these aspects of the patient's history.

2. The respondent failed to provide adequate prenatal care to the patient in that the respondent did not order appropriate diagnostic tests and examinations in assessing the patient. In the delivery of prenatal care, the appropriate standard of medical care requires that the OB/GYN order certain routine laboratory tests, including, but not limited to, a serologic test for syphilis (STS), gonorrhea (GC), Rubella titer, chlamydia, repeat complete blood count (CBC), and a 50 gm glucose screening test. There is no evidence in the medical record that the respondent ordered these tests. The patient had been seen in the emergency room of Holy Cross Hospital on March 5, 1990, at which point a urinalysis, CBC, and human chorionic gonadotropin (HCG) tests were performed. The CBC showed a hemoglobin (HGB) of 9.5 gm, a value consistent with anemia. The respondent did not order any further laboratory tests after these tests were taken.

There is no evidence in the medical record that the respondent performed a general physical examination or a pelvic examination of the patient at the patient's initial visit. The appropriate standard of care requires that the OB/GYN perform an adequate physical examination of the patient at or near the patient's initial prenatal visit.

3. The respondent failed to address the patient's prenatal anemia. On March 5, 1990, laboratory tests performed at Holy Cross Hospital, found in the medical record chart, indicated that the patient was anemic (hematocrit (HCT) 29.0 percent, HGB 9.5 gm.). Under the above circumstances, the appropriate standard of medical care requires that at a minimum, the OB/GYN prescribe vitamins and iron supplements to address the patient's condition and periodically re-evaluate the patient's blood count. There is no evidence in the medical record that the respondent ordered these tests or attempted to treat the patient's condition.

Patient B

Patient B, a 24-year-old female, sought obstetric care from the respondent from July 1989 through March 1990. The patient's LMP was June 19, 1989. The patient's initial prenatal visit with the respondent was on July 31, 1989. The patient gave birth to a live infant on March 19, 1990. The patient saw the respondent on two postpartum visits in April and May 1990.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent did not document in the patient's medical record an adequate history during the patient's initial visit. The appropriate standard of medical care requires that the OB/GYN document an adequate history of the patient, which should include, but not be limited to, the patient's past medical history, family history, and hospitalizations. There is no indication in the medical record that the respondent recorded this information.
2. The respondent failed to perform, or did not document that he had performed, a complete physical examination of the patient during the patient's initial visit. The appropriate standard of medical care requires that the OB/GYN perform an adequate physical examination of the patient during the patient's initial visit. There is no indication in the record that the respondent performed examination of pulmonary, respiratory, or cardiac systems, or a complete abdominal examination.

Board of Physician Quality Assurance Actions

The respondent did not order certain prenatal diagnostic tests. There is no indication in the medical record that the respondent ordered tests for GC, chlamydia, hepatitis B surface antigen (HBsAg), and did not order a 50 gm glucose screen (at twenty-eight weeks). Although the respondent ordered a CBC during the patient's initial visit, there is no indication in the record that the respondent ordered a follow-up CBC thereafter during the patient's prenatal care. The appropriate standard of medical care requires that the OB/GYN order these tests in the delivery of prenatal care to a patient.

3. The respondent failed to address the patient's borderline anemia. The patient's initial CBC, taken August 1, 1989, indicated that the patient was borderline anemic (HCT 31.5 percent, HGB 10.6 gm). There is no indication in the medical record that the respondent prescribed an iron supplement or prenatal vitamins, or addressed the patient's condition during the patient's prenatal care.

Patient C

Patient C, a 34-year-old female, received prenatal care from the respondent on two occasions, November 29, 1989 and May 30, 1990; and saw the respondent for a postpartum visit on June 20, 1990. The patient's LMP was September 13, 1989. The patient delivered a live infant on June 1, 1990. The respondent also performed a postpartum left partial salpingectomy on the patient on June 1, 1990.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The medical record is inadequate. The record for this patient's prenatal course consists of two brief entries. The appropriate standard of medical care requires that the OB/GYN document, among other pertinent data, the patient's past medical history, previous surgeries, and prior pregnancies. There is no documentation in the respondent's records of these aspects of the patient's history. Although the patient had previously undergone a right salpingectomy, this fact is not listed in the patient history (reference to this surgical procedure is noted in an operative note for the postpartum left partial salpingectomy described above).

In another example, an insurance certification notice dated June 7, 1990 and contained in the medical record, indicates that the patient was hospitalized on June 5, 1990 for a pulmonary embolism. No reference to this fact exists in the respondent's June 20, 1990 postpartum visit entry.

The respondent did not adequately document or describe his evaluation of the patient's chief complaint in the November 29, 1989 prenatal visit. The appropriate standard of medical care requires that the OB/GYN adequately document the patient's chief complaint in the patient record. In this entry, the respondent noted that the patient had "c/o pain on right side, epigastric, lower quad." No assessment of this pelvic pain is provided in the medical record.

2. The respondent failed to perform, or failed to document that he had performed, a physical examination on the patient's November 29, 1989 prenatal visit. The appropriate standard of medical care requires that the OB/GYN perform a general physical examination of the patient at or near the patient's initial visit, and document these findings in the medical record. Although the respondent conducted breast and pelvic examinations of the patient, the respondent did not perform, or did not document the findings of, the general physical examination of the patient.

Patient D

Patient D, a 23-year-old female, sought gynecologic care from the respondent on one occasion, June 13, 1990, for vulvar bumps. The respondent diagnosed the patient as having folliculitis vulvae, and ordered a follow-up visit in six months.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent's medical history is inadequate. The appropriate standard of medical care requires that the OB/GYN document a complete history of the patient in the record, which should include, but not be limited to, the patient's past medical history, drug sensitivities, prior pregnancies, and social and family history. There is no indication in the medical record that the respondent obtained this information.
2. The respondent failed to perform, or failed to document that he had performed, a physical examination of the patient on the patient's June 13, 1990 office visit. The appropriate standard of medical care requires that the OB/GYN perform a general physical examination of the patient (particularly when that individual is a first-time patient) and to document the findings of the physical examination in the medical record.
3. The respondent did not appropriately treat the patient's diagnosed condition. Under the above circumstances, the appropriate standard of medical care requires that the OB/GYN formulate a treatment plan to treat the patient's condition, which would include, but not be limited to appropriate medication and, perhaps, vulvar biopsy. There is no indication in the medical record that the respondent undertook any kind of treatment of the patient's condition.

Patient E

Patient E, a 25-year-old female, sought prenatal care from the respondent on one occasion, April 4, 1990. The patient's LMP was January 13, 1990. The patient's EDC was October 21, 1990.

The respondent failed to meet the appropriate standard of care in regard to this patient by failing to document an adequate history of the patient in the patient's medical record. The appropriate standard of medical care requires that the OB/GYN document an adequate history of the patient, which should include, but not be limited to, documentation of the patient's past medical history, family history, hospitalization, and operations. The medical record fails to contain documentation of these aspects of the patient's history.

Patient F

Patient F, a 30-year-old female, sought obstetric and gynecologic care from the respondent from 1985 through 1990. During this time period, the patient received prenatal care for the period June 1988 through February 1989. The patient's LMP was April 25, 1988. The patient delivered a live female child on February 6, 1989.

The respondent failed to meet the appropriate standard of care in regard to this patient by failing to provide adequate prenatal care, in that he did not order certain laboratory tests to monitor the patient's condition. Although the respondent ordered a CBC at or near the patient's initial prenatal visit, the respondent did not order a subsequent CBC until thirty-weeks gestation. In addition, the respondent did not order a 50 gm glucose screening test at twenty-eight weeks gestation. The patient gained 46 pounds during her pregnancy.

Under the above circumstances, the appropriate standard of medical care requires that the OB/GYN perform a repeat CBC on a

Board of Physician Quality Assurance Actions

pregnant patient at twenty-eight weeks gestation to monitor the patient for such conditions as anemia or, more commonly, thrombocytopenia. Furthermore, the appropriate standard of medical care requires that the OB/GYN order a 50 gm glucose screening at twenty-eight weeks gestation to evaluate the patient for gestational diabetes. There is no indication in the medical record that the respondent ordered these tests in a timely fashion. This failure to order the glucose screening test was particularly significant in view of the patient's weight gain, which was suggestive of possible glucose intolerance.

Patient G

Patient G, a 28-year-old female, initially sought prenatal care from the respondent on December 6, 1989. The patient's LMP was October 3, 1989. During the patient's pregnancy, the patient gained a total of approximately three pounds.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent did not document an adequate history of the patient in the patient's medical record. The appropriate standard of medical care requires that the OB/GYN document an adequate history of the patient in the patient's medical record, which should include, but not be limited to, a history of present illnesses, past medical history, menstrual history, and family and social history. The medical record fails to contain documentation of these aspects of the patient's history.
2. The respondent did not monitor the patient's pregnancy appropriately, particularly in view of the patient's abnormal weight gain. The appropriate standard of medical care requires that the OB/GYN monitor a patient's weight gain during the course of the patient's pregnancy. When the patient's weight gain is abnormally low, as in this patient, the appropriate standard of medical care requires that the OB/GYN evaluate the patient's poor weight gain by means of periodic sonograms, and possibly nonstress testing. Although the respondent ordered a sonogram at twenty-one weeks, he did not order any ultrasounds thereafter during the patient's prenatal care. Furthermore, the respondent did not order a CBC or a 50 gm glucose screening test at twenty-eight weeks gestation. The appropriate standard of medical care requires that the OB/GYN order these tests at this point in the patient's pregnancy in the assessment of the patient's pregnancy. There is no indication in the medical record that these tests were ordered by the respondent.

Patient H

Patient H, a 36-year-old female, sought gynecologic care from the respondent on one occasion, June 27, 1990.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent did not document the chief complaint or an adequate history of the patient. Based on the fertility tests ordered by the respondent, it appears that the patient's complaint related to infertility. The appropriate standard of medical care requires that the OB/GYN document an adequate history of the patient in the medical record, which should include, but not be limited to, documentation of the patient's past medical history, family history, hospitalizations, operations, menstrual history, and, in this case, a complete fertility history.

2. The respondent failed to document the results of a general physical examination. The appropriate standard of medical care requires that the OB/GYN document the results of a physical examination of the patient, particularly under the above circumstances, where the patient is receiving care for the first time from the respondent and, presumably, is seeking medical care for possible infertility.

Patient I

Patient I, a 19-year-old female, sought gynecologic care from the respondent on one occasion, April 4, 1990. The patient visited the respondent for a prescription for oral contraceptives.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent did not document an adequate history of the patient in the patient's medical record. The appropriate standard of medical care requires that the OB/GYN document an adequate history of the patient, which should include, but not be limited to, the patient's past medical history and family history. These aspects of the patient's history are not documented in this record.
2. The respondent failed to perform a physical examination of the patient prior to prescribing oral contraceptives. The appropriate standard of medical care requires that the OB/GYN perform a complete physical examination of the patient at the patient's initial visit. There is no indication in the medical record that the respondent performed an examination of the patient prior to prescribing oral contraceptives.

Patient J

Patient J, a 29-year-old female, received prenatal obstetric care from the respondent in February and March 1990. The respondent assumed the care of the patient during her eighth month of pregnancy. A CBC, taken February 23, 1990, indicated that the patient was anemic (HCT 32.0 percent, HGB 10.4 gm.). On March 21, 1990, the respondent scheduled the patient for a cesarean section and tubal ligation, which were performed on March 23, 1990. The patient delivered a live male on that date.

The respondent failed to meet the appropriate standard of care in regard to this patient by failing to appropriately manage the patient's anemia. The medical record chart contains a CBC laboratory report from February 24, 1990, indicating that the patient was anemic. In his progress notes, on March 14, 1990, the respondent noted that the patient's hemoglobin reading was 10.4 gm. The appropriate standard of medical care requires that the OB/GYN prescribe prenatal vitamins and iron supplements and perform follow-up blood work under these circumstances. This is particularly significant in view of the patient's scheduled surgery.

Patient K

Patient K, a 16-year-old female, sought gynecologic care from the respondent on one occasion, April 25, 1990. The patient's LMP was March 18, 1990. The patient's medical record chart, at one point, indicates that the patient "did EPT." At another point in the chart, in the physical examination section, the respondent notes "may be pregnant."

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent failed to keep an adequate medical record in regard to this patient. The appropriate standard of medical care

Board of Physician Quality Assurance Actions

requires that the OB-GYN document an adequate history of the patient, which should include, but not be limited to, documentation of the patient's past medical history, hospitalizations, and family history. There is no indication in the medical record that these aspects of the patient's history were documented.

2. The respondent also failed to document that he had performed a general physical examination and a breast examination. The appropriate standard of medical care requires that the OB/GYN document the results of a physical examination and breast examination in the medical record chart if these examinations were performed. There is no documentation in the patient's medical record that the respondent performed these examinations.
3. The respondent did not appropriately manage this patient's condition. The medical record indicates that the patient may have been pregnant. The respondent ordered a pregnancy test, but also concomitantly prescribed Triphasil, an oral contraceptive, for the patient. The appropriate standard of medical care requires that the OB/GYN make a determination as to whether the patient is pregnant prior to prescribing oral contraceptives. The prescribing of oral contraceptives to women who are pregnant or are possibly pregnant is contraindicated in that oral contraceptives may have adverse effects on the pregnancy. There is no indication in the medical record that the respondent advised the patient to wait for the results of the pregnancy test or the onset of menses prior to using the oral contraceptives prescribed.

Patient L

Patient L, a 33-year-old female, sought gynecologic and obstetric care from the respondent from 1988 through 1990. During this time period, the patient tested positive for pregnancy in July 1988, and had a therapeutic abortion on August 6, 1988. The patient was diagnosed thereafter on August 18, 1988 as being hypertensive (blood pressure (BP) 154/94). The patient again tested positive for pregnancy on November 17, 1989. During the course of the prenatal care, the respondent diagnosed the patient as being hypertensive. The patient delivered a live infant by cesarean section on April 29, 1990.

The respondent failed to meet the appropriate standard of care in regard to this patient by failing to appropriately manage the patient's hypertensive condition. During the course of the patient's prenatal care, the respondent noted the patient's BP at 140/100 at twenty-four-weeks gestation (March 21, 1990). The respondent prescribed Aldomet 250 mg, an antihypertensive medication, but did not order any further diagnostic tests or consultation for assessment of this condition. The respondent did not see the patient for another two weeks, until April 4, 1990, when the patient's BP was 150/100. The respondent increased the dosage of Aldomet. On April 11, 1990, the respondent noted the patient's BP at 170/90. The patient was admitted to Washington Hospital Center on April 17, 1990 with a BP of 160/109. The patient's BP on the date of discharge, April 19, 1990, was 156/106. The consultant's report, dated April 19, 1990, indicated that the patient had complained of severe headaches for two weeks. Under the above circumstances, the appropriate standard of medical care requires that the OB/GYN undertake more aggressive measures to control the patient's hypertension, including additional medication and earlier consultation and hospitalization. As a result of the patient's hypertension, the patient delivered a premature infant by cesarean section at twenty-nine-weeks gestation. In this case, the respondent followed the patient's hypertensive condition for one

month before more aggressive action (i.e., hospitalization, additional medications) was undertaken.

Patient M

Patient M, a 22-year-old female, sought gynecologic care from the respondent on one occasion, April 18, 1990. The patient had had an abnormal (Class II) Pap smear in February 1990.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent did not document an adequate history of the patient in the patient's medical record. The appropriate standard of medical care requires that the OB/GYN document an adequate history of the patient in the patient's medical record, which should include, but not be limited to, the patient's past medical, family, and social history. The medical record fails to contain documentation of these aspects of the patient's history.
2. In the assessment of the patient's condition, the appropriate standard of care requires that the OB/GYN perform a general physical examination. Although the medical record indicates that the respondent performed pelvic and breast examinations, there is no indication in the record that the respondent performed a general physical examination of this new patient.
3. The respondent did not adequately evaluate the patient's condition. The appropriate standard of medical care requires that the OB/GYN order follow-up tests to evaluate the earlier abnormal Pap smear. These tests would include, but would not be limited to, a second Pap smear and colposcopy with directed biopsies. The appropriate standard of medical care would also include formulation and documentation of an adequate treatment plan in the medical record. There is no indication in the patient's medical record that the respondent ordered any of the above tests, or that the respondent formulated a proposed treatment plan or requested follow-up visits to monitor the patient's condition.

Patient N

Patient N, a 16-year-old female, sought gynecologic care from the respondent on one occasion, May 23, 1990. At this visit, the respondent prescribed oral contraceptives and advised the patient to return for follow-up care in six months.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The respondent failed to document an adequate medical record in regard to this patient. The appropriate standard of medical care requires that the OB/GYN, among other data, document the patient's chief and secondary complaints; history of present illness; past medical history; hospitalizations; family and social history. The medical record fails to contain documentation of this data.
2. The respondent did not appropriately assess this patient prior to prescribing oral contraceptives. Under those circumstances where an OB/GYN provides care to a new patient and, during that initial visit prescribes oral contraceptives, the appropriate standard of medical care requires that the OB/GYN perform a physical examination of the patient, including a review of respiratory, pulmonary, and cardiac systems, as well as breast and pelvic examinations. Prior to the prescribing of oral contraceptives, the appropriate standard of medical care requires that the patient's BP be evaluated to ensure that the BP is not elevated. The use of oral contraceptives may be contraindicated in those

Board of Physician Quality Assurance Actions

patients with elevated blood pressure. There is no indication that the respondent performed a general physical examination of the patient, and no indication in the medical record that the respondent documented the patient's BP, if indeed the respondent checked the patient's BP.

Patient O

Patient O, a 33-year-old female, sought obstetric and gynecologic care from the respondent at various times from 1981 through 1990. During the relevant treatment period in 1988, the patient saw the respondent on two occasions, August 18 and September 15. The patient's LMP relative to those visits was May 25, 1988. The patient initially presented with amenorrhea. The respondent prescribed Provera, a synthetic progestational agent. At the September 15, 1988 visit, the patient complained of sharp, intermittent left-sided pelvic pain. The respondent ordered an ultrasound, and prescribed oral contraceptives. In neither visit did the respondent order any tests to confirm or rule out pregnancy.

The respondent failed to meet the appropriate standard of care in that the respondent did not adequately evaluate the patient's presenting condition, amenorrhea. Under the above circumstances, the appropriate standard of medical care requires that the OB/GYN order tests to confirm or rule out pregnancy. In addition, when, as above, the patient, who was amenorrheic, presents with one-sided pelvic pain, the physician should order tests to confirm or rule out an ectopic pregnancy. There is no indication in the record that the respondent ordered these confirmatory tests.

Further, the prescribing of Provera and/or oral contraceptives to patients who are pregnant or are possibly pregnant is contraindicated in that these drugs may have an adverse effect on pregnancy.

The patient then saw the respondent for prenatal care on January 31, 1990. The patient's LMP relative to this visit was December 15, 1989. The medical record indicates that the respondent saw the patient in March, April, May, June, and July 1990. The respondent did not appropriately monitor the patient's pregnancy. The appropriate standard of medical care requires that the OB/GYN order certain routine laboratory tests, including, but not limited to, an HBsAg test. The appropriate standard of medical care also requires that the OB/GYN order a repeat CBC at twenty-eight-weeks gestation to monitor the patient for such conditions as anemia or, more commonly, thrombocytopenia. In addition, the appropriate standard of medical care requires that the OB/GYN order a 50 gm glucose screening test at twenty-eight-weeks gestation to evaluate the patient for possible gestational diabetes. There is no indication in the medical record that the respondent ordered these tests in a timely fashion.

Patient P

Patient P, a 21-year-old female, sought gynecologic care from the respondent on one occasion, June 13, 1990. The respondent diagnosed the patient as having dysfunctional uterine bleeding (DUB), and noted that the patient had sickle cell anemia. The respondent ordered various tests, including a Pap smear, and scheduled a follow-up visit for the patient in three months.

The respondent failed to meet the appropriate standard of care in regard to this patient for the following reasons:

1. The medical record is inadequate. The appropriate standard of medical care requires that the OB/GYN, at a minimum, document a history of the patient; the patient's chief and secondary

complaints; objective findings, including the results of any physical examinations of the patient and the findings of any pertinent laboratory tests; an assessment of the patient; and a treatment plan.

The respondent did not adequately document the patient's history in the medical record. Documentation of a patient's history should include, but not be limited to, the patient's history of any present illnesses, past medical history, allergies, drug sensitivities, current medications, and family history. Because the medical record indicates that the patient had sickle-cell anemia, the treating physician should also include details about the patient's illness, including a history of the frequency of transfusions (and whether the patient was counseled in regard to the human immunodeficiency virus), and the frequency and type of crises the patient may have experienced as a result of the sickle-cell condition.

2. The respondent also did not document the results of a physical examination. Although the respondent conducted breast and pelvic examinations, there is no documentation in the medical record chart that the respondent performed a general physical examination of the patient.
3. In his assessment of the patient's condition, the respondent failed to substantiate the diagnosis entered in the chart, DUB. There is no description of abnormal bleeding patterns to substantiate a diagnosis of DUB. The appropriate standard of medical care requires that the treating physician document a medical rationale for the diagnosis.
4. The respondent did not order a treatment plan for the patient's condition. The appropriate standard of medical care requires that the physician, where possible, order a treatment plan to manage the patient's condition. The respondent did not order cycling with progestational medication or dilatation and curettage (D&C), or make any reference in the medical record as to why the above therapies were considered and rejected.

Notice of possible sanctions

If, after a hearing, the board finds that there are grounds for action under *Md. Health Occ. Code Ann.* §14-404(a)(22), the board may impose disciplinary sanctions against the respondent's license, including revocation, suspension, or reprimand, and may place the respondent on probation.

Notice of hearing, settlement conference, and prehearing conference

A hearing in this matter has been scheduled for October 3, 1991 at 1:00 p.m. in the Office of Administrative Hearings, Administrative Law Building, Greenspring Station, 10753 Falls Road, Lutherville, Maryland 21093.

In addition, a settlement conference in this matter has been scheduled for August 14, 1991 at 1:30 p.m. in the board's office, 4201 Patterson Avenue, Baltimore, Maryland 21215; and a prehearing conference in this matter has been scheduled for September 26, 1991 at 9:00 a.m. in the Office of Administrative Hearings, Administrative Law Building, Greenspring Station, 10753 Falls Road, Lutherville, Maryland 21093. The nature and purpose of the settlement conference and prehearing conference is described in the letter to the respondent.

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Board of Physician Quality Assurance Actions

■ ■ ■

**In the matter of
Robert L. White
before the
Maryland Board of
Physician Quality Assurance
Consent order**

Having reviewed certain information which came to its attention, the Board of Physician Quality Assurance (the board), on February 27, 1991, voted to charge Robert L. White (the respondent), physician assistant, with the commission of a prohibited act under the Maryland Medical Practice Act (the act), *Md. Health Occ. Code Ann.* (HO) §15-314(3).

The pertinent provision of the act under HO §15-314(3) provides the following:

Subject to the hearing provisions of §15-315 of this subtitle, the board, on the affirmative vote of a majority of its members then serving, may reprimand any certificate holder or suspend or revoke a certificate if the certificate holder:

...commits any act which could serve as the basis for disciplinary action against a physician under §14-404 of this article.

The basis for disciplinary action under HO §14-404 is as follows:

...pleads guilty ... with respect to a crime involving moral turpitude ... [See HO §14-404(b)].

The respondent pleaded guilty on November 5, 1990 to three counts of violating *Md. Code Ann.* Art. 27§300, in which it was alleged that the respondent unlawfully obtained the prescription drug Stadol "by fraud, deceit, misrepresentation and subterfuge, to wit: by forging a prescription" during the period December 12, 1988 through July 11, 1989.

On May 22, 1991, a settlement conference was held with the following board members present: John F. Strahan, M.D., chief settlement officer; J. Andrew Sumner, M.D.; and Frank A. Gunther, Jr. Also present were the respondent; the respondent's spouse, Mrs. White; P. Paul Cocoros, Esquire, counsel for the respondent; Robert J. Gilbert, assistant attorney general, administrative prosecutor; and Barbara Hull Foster, assistant attorney general, counsel to the board. As a result of the discussions at the settlement conference, the settlement conference members recommended that the board resolve this case by entering into the following consent order. At its meeting on Wednesday, June 26, 1991, the board considered the settlement conference's recommendation and agreed to the following Consent Order.

Findings of fact

1. At all times relevant to these charges, the respondent was and is certified to practice as a physician assistant in the state of Maryland.
2. On or about September 19, 1990, the respondent was

charged in the matter of *State of Maryland v Robert Lee White, Jr.*, under Case Number 660849CO, with ten counts of violating *Md. Code Ann.* Art. 27, §300, in which it was alleged that the respondent unlawfully obtained various prescription drugs, such as Stadol, Pyridiate, and Buprenex "by fraud, deceit, misrepresentation, and subterfuge, to wit: by forging a prescription" during the period December 12, 1988 through July 11, 1989, all occurring at Drug City, a pharmacy located at 2805 North Point Boulevard in Baltimore County, Maryland.

3. On or about November 5, 1990, the respondent appeared in the District Court for Baltimore County, Dundalk, Maryland, the Honorable Thomas Bollinger presiding, in regard to the aforementioned charges. On this date, the respondent, after engaging in plea negotiations with the assistant state's attorney for Baltimore County, entered guilty pleas to three counts of violating *Md. Code Ann.* Art. 27, §300, in which it was alleged that on three occasions, December 12, 1988, January 8, 1989, and January 14, 1989, the respondent unlawfully obtained Stadol, a prescription drug, through fraud, by forging prescriptions (see section two above). Sentencing was deferred pending a pre-sentence investigation of the respondent.
4. On or about February 21, 1991, the respondent appeared for sentencing on the aforementioned charges in the District Court for Baltimore County, Towson, Maryland, the Honorable G. Darrell Russell presiding. The respondent was granted probation before judgment under *Md. Code Ann.* Art. 27, §641 as to the three counts of the aforementioned charges. The respondent was fined \$100 on each count, for a total of \$300.
5. Under the terms and conditions of probation before judgment under *Md. Code Ann.* Art. 27, §641(a)(4), an individual who has received a stay of entering of the judgment waives the right to appeal from the judgment of guilt by the court at any time.
6. The crime of unlawfully obtaining a prescription drug by fraud, deceit, misrepresentation, or subterfuge by the forging of a prescription order, under *Md. Code Ann.* Art. 27, §300, as described in paragraphs two, three, and four above, is a crime involving moral turpitude under the act.

Conclusions of law

Based on the foregoing findings of fact, the board concludes that the respondent has pleaded guilty to a crime involving moral turpitude. Accordingly, the board concludes as a matter of law that the respondent has violated HO §§15-314 and 14-404(b).

Order

Based on the foregoing findings of fact and conclusions of law, it is this 23rd day of July 1991, by the board, hereby

Board of Physician Quality Assurance Actions

ORDERED, that pursuant to the authority vested in the board under HO §15-314(3), the respondent's certification to practice as a physician assistant in the state of Maryland is hereby **SUSPENDED** for a period of three months from the date of this order, that date being the date the board signs this order; and be it further

ORDERED, that the respondent immediately shall surrender to the board his physician assistant certification, wall license, and any renewal cards; and be it further

ORDERED, that the respondent, in the event that he intends to seek reinstatement of his certification to practice as a physician assistant, must, at the conclusion of the period of suspension, petition the board for recertification as a physician assistant, i.e., must fill out a new application for certification; and be it further

ORDERED, that at the conclusion of the period of suspension, the respondent, in the event that he intends to seek reinstatement, and after following the procedures outlined above, shall be placed on probation for a period of three years, subject to bi-annual reports from the respondent's supervising physician(s) as to his performance; and be it further

ORDERED, that, in the event that the respondent's certification to practice as a physician assistant is reinstated by the board, the board shall notify the respondent's supervising physician(s) of this consent order; and be it further

ORDERED, that any public disclosure of the foregoing shall consist of the contents of this **CONSENT ORDER** as permitted by *State Gov't. Code Ann. §10-617(h)*.

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Consent

I, Robert L. White, Jr., acknowledge that I am represented by legal counsel and have had an opportunity to consult with counsel before entering into and signing this document. By this consent, I hereby admit the truth of the findings of fact, conclusions of law, and accept and submit to the foregoing consent order and its conditions, consisting of eight pages.

I acknowledge the validity of this consent order as if entered after the conclusion of a formal evidentiary hearing in which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by the laws of the state of Maryland. I acknowledge the legal authority and the jurisdiction of the board to initiate these proceedings and to issue and enforce this consent order. I also recognize that I am waiving my right to appeal any adverse ruling of the board that might have followed any such hearing.

I sign this order after having an opportunity to consult with counsel, without reservation, and I fully understand and comprehend the language, meaning, and terms of this consent order.

ROBERT L. WHITE

National Library Week

April 5-11, 1992

and

International Special Librarians Day

April 9, 1992

Since 1958 the American Library Association and related organizations have celebrated National Library Week to encourage reading and the continued wide availability of books. This year, National Library Week's theme is "Your right to know. Librarians make it happen." This emphasizes one of our most basic democratic freedoms and the library's key role in ensuring access to information for all.

Beginning in 1991, the Special Libraries Association further designated one day of National Library Week as International Special Librarians Day. This year the day falls on April 9 and the theme is "Information knows no bounds."

Rabies, 1991, and Universal Infant Hepatitis B Vaccine / Postexposure Prophylaxis for Hepatitis B April, 1992

Animal Rabies in Maryland, 1991

In 1991, Maryland again was third in the United States in laboratory confirmed animal rabies (579), behind the more recently involved states of New York and New Jersey, and ahead of Texas and California.

Figure 1 shows the number of animals identified as having rabies in Maryland from 1981 to 1991. In 1991, there were 111 more cases of animal rabies than in 1990 (24% increase) and an additional 241 (71% increase) over the low of 1988. Confirmed animal rabies peaked in 1984 with 1100 cases as the result of an epizootic (animal epidemic) which involved several populous counties of Central Maryland over a short time. There has been no human rabies in Maryland during the epizootic since it began in 1981.

In 1991, 207 of the rabid animals were from the Eastern Shore counties located entirely below the Chesapeake and Delaware Canal (i.e., Kent, Queen Anne's, Caroline and Talbot Counties), up from 108 in 1990. In August, 1986, wildlife rabies slowly began advancing around the northern end of the Chesapeake Bay in Cecil County. Kent County became involved in October, 1989, and Caroline and Queen Anne's in 1990. Talbot County had its first rabid racoon found in February, 1991. In 1991, Kent had a total of 20 cases, Caroline 56, Queen Anne's 77, and Talbot 54.

Seven jurisdictions west of the Chesapeake Bay reported significant increases in 1991. Those counties were Allegany 4 (36% increase), Anne Arundel 30 (111%), Carroll 6 (50%), Frederick 40 (143%), Montgomery 8 (35%), St. Mary's 1 (25%) and Washington 14 (88%). Because these counties had been originally involved in the epizootic 6 to 11 years ago, these increases represent an apparent cyclic recovery of the racoon population and an increase in susceptibles that are now getting rabies.

Raccoon rabies accounted for 467 (80.7%) of the 579 cases in 1991. All other species with rabies, except the bat, are regarded as spillover from the maintenance host, the racoon. There is no evidence of transmission within the various spillover species. Fox cases (18, 3.1%), skunk (51, 8.8%), groundhog (10, 1.7%), bat (12, 2.2%) and beaver (1, 0.2%) changed little in percentage of confirmed cases. Similarly, domestic animals varied very little from the previous year, with 15 cats (2.6%), 2 dogs (0.4%), 1 bovine (0.2%) and 1 horse (0.2%) being confirmed rabid. Of the domestic animals, cats continue to represent the greatest risk of exposure to humans. In addition to a higher number of cats being rabid (15 as compared to 2 rabid dogs), each cat exposes

more humans. The reason for this is not clear although the cat may be less often suspected as rabid. For example, a stray cat (especially a kitten) is likely to invoke a person's pity; the person may misinterpret early signs of rabies as extraordinary friendliness, helplessness, or injury of an otherwise untame cat.

The threat of rabies from human exposure to raccoons is clear. Less often recognized is the fact that the groundhog shares burrows with the raccoon. That is peculiar to the raccoon epizootic and results in unusually high numbers of rabid groundhogs. This is not the case in epizootic rabies in which the fox or skunk is the maintenance host. Since 1981, Maryland has recorded 59 rabid groundhogs as contrasted with a total of 18 other miscellaneous wild animals.

Rabies Deaths in the United States, 1991

Three human rabies deaths were reported in the United States in 1991. The following case reports are excerpted from: CDC, Human Rabies - Texas, Arkansas, and Georgia, 1991. MMWR 1991; 40, 44: 765-769.

Patient 1. A woman from a county in Texas bordering Mexico died 13 days after onset of nervousness, shortness of breath, difficulty swallowing, followed by aerophobia, hydrophobia, and ascending paresis. Rabies was considered in the differential diagnosis on the 5th day. A nape of the neck biopsy was negative on that day but by the 10th day CDC detected rabies virus in the saliva. On the 12th day a second biopsy was positive by DFA. Monoclonal antibody typing showed an isolate identical to the virus strain found in dogs in Mexico and along the border of Mexico and Texas where rabies is endemic in dogs and coyotes. The woman had no known exposure to rabies. Possible exposure to this woman resulted in 43 persons receiving postexposure prophylaxis.

Patient 2. On August 17 an Arkansas man had onset of sore throat, headache and two days later swallowing difficulty. The same day he became anxious, tearful, and his facial muscles were twitching. Upon hospitalization that evening he was alert and oriented and, although he gave no history of animal bites, rabies was considered. Later he complained of itching, gagging sensation and became agitated and photophobic. He died on the 9th day. Postmortem samples of brain tissue were positive for rabies by DFA. Subsequent monoclonal antibody typing at CDC suggested a rabies variant common in the silver-haired bat.* A friend of the patient reported that in early July a bat had landed on the man's face who killed and disposed of it. Others recalled the patient had told of bites on his thumb or scratches on his chest. A total of 99 persons who had possible exposure to the patient from two weeks before onset received postexposure prophylaxis.

Patient 3. A Georgia woman developed sore throat, headache, and fever and was treated with parenteral antibiotics. Two days later she was admitted to a local

hospital with painful swallowing, agitation, and fever of 40°C. Rabies was considered in the differential diagnosis at a referral hospital. Her condition continued to deteriorate and she died on the 7th day. Rabies was confirmed at postmortem by DFA. Monoclonal antibody typing at CDC suggested the same rabies variant as isolated from patient 2. There was no known animal exposure.

Comment: Rabies postexposure prophylaxis is recommended for all persons bitten or scratched by wild or domestic animals that may be carrying the disease. Exposures other than bites or scratches rarely result in infection. However, postexposure treatment is recommended for persons who report having an open wound or mucous membrane contaminated with saliva or other potentially infectious material (e.g., brain tissue) from a rabid animal. Since the size of bites by bats may be small in comparison to those inflicted by terrestrial animals, it may be prudent to consider postexposure treatment for physical contact with bats when a bite or mucous membrane exposure cannot be excluded. Treatment should always be initiated as soon as possible after bites or scratches by known or suspected rabid animals occur.

*Note: The silver-haired bat (*Lasiurus noctivagus*) also breeds in the Allegheny Mountain section of Maryland but occurs in all areas of the state as a migrant. It is a colonial bat which roosts in small groups in hollow trees, dense foliage and occasionally buildings.

Animal bites are reportable to your local health department in Maryland. All local health departments or the Maryland Department of Health and Mental Hygiene can be contacted for consultation on postexposure prophylaxis against rabies.

Hepatitis B: Universal Vaccination of Infants Born to HBsAg-Negative Mothers

Hepatitis B vaccination is recommended for all infants, regardless of the HBsAg status of the mother. Hepatitis B vaccine should be incorporated into vaccination schedules for children. The first dose can be administered during the newborn period, preferably before the infant is discharged from the hospital, but no later than when the infant is 2 months of age (Table 1). Because the highest titers of anti-HBs are achieved when the last 2 doses of vaccine are spaced at least 4 months

apart, schedules that achieve this spacing may be preferable. However, schedules with 2-month intervals between doses, which conform to schedules for other childhood vaccines, have been shown to produce a good antibody response and may be appropriate in populations in which it is difficult to ensure that infants will be brought back for their vaccinations. The development of combination vaccines containing HBsAg may lead to other schedules that will allow optimal use of combined antigens.

TABLE 1. Recommended schedules of hepatitis B vaccination for infants born to HBsAg*-negative mothers

Hepatitis B vaccine	Age of infant
Option 1	
Dose 1	Birth—before hospital discharge
Dose 2	1-2 months [†]
Dose 3	6-18 months [†]
Option 2	
Dose 1	1-2 months [†]
Dose 2	4 months [†]
Dose 3	6-18 months [†]

*HBsAg = Hepatitis B surface antigen.

[†]Hepatitis B vaccine can be administered simultaneously with diphtheria-tetanus-pertussis, *Haemophilus influenzae* type b conjugate, measles-mumps-rubella, and oral polio vaccines at the same visit.

The recommended dose of hepatitis B vaccine when given to infants of HBsAg negative mothers is 0.25 ml for Recombivax HB (Merck, Sharp & Dohme) and 0.5 ml for Engerix-B (Smith-Kline and French).

Postexposure Prophylaxis for Hepatitis B

Acute Exposure to Blood That Contains (or Might Contain) HBsAg

For inadvertent percutaneous (needle stick, laceration, or bite) or permucosal (ocular or mucous membrane) exposure to blood, the decision to provide prophylaxis must include consideration of several factors: a) whether the source of the blood is available; b) the HBsAg (hepatitis B surface antigen) status of the source; and c) the hepatitis B vaccination and vaccine-response status of the exposed person. Such exposures usually affect persons for whom hepatitis B vaccine is recommended. For any exposure of a person not previously vaccinated, hepatitis B vaccination is recommended.

After any such exposure, a blood sample should be obtained from the person who was the source of the exposure and should be tested for HBsAg. The hepatitis B vaccination status and anti-HBs (hepatitis B surface antibody) response status (if known) of the exposed person should be reviewed. The outline below and Table 2 summarize prophylaxis for percutaneous or permucosal exposure to blood according to the HBsAg status of the source of exposure and the vaccination status and vaccine response of the exposed person.

For greatest effectiveness, passive prophylaxis with HBIG, when indicated, should be administered as soon

as possible after exposure since its value beyond 7 days after exposure is unclear.

I. Source of exposure HBsAg-positive

- Exposed person has not been vaccinated or has not completed vaccination. Hepatitis B vaccination should be initiated. A single dose of HBIG (Hepatitis B Immune Globulin) (0.06 mL/kg) should be administered as soon as possible after exposure and within 24 hours, if possible. The first dose of hepatitis B vaccine should be administered intramuscularly at a separate site (deltoid for adults) and can be administered simultaneously with HBIG or within 7 days of exposure; subsequent doses should be administered as recommended for the specific vaccine. If the exposed person has begun but has not completed vaccination, one dose of HBIG should be administered immediately, and vaccination should be completed as scheduled.
- Exposed person has already been vaccinated against hepatitis B, and anti-HBs response status is known.
 - If the exposed person is known to have had adequate response in the past, the anti-HBs level should be tested unless an adequate level has been demonstrated within the last 24 months. Although current data show that vaccine-induced protection does not decrease as

antibody level wanes, most experts consider the following approach to be prudent:

- a) If anti-HBs level is adequate, no treatment is necessary.
 - b) If anti-HBs level is inadequate, a booster dose of hepatitis B vaccine should be administered. (An adequate antibody level is ≥ 10 mIU/mL.)
- (2) If the exposed person is known not to have responded to the primary vaccine series, he or she should receive either a single dose of HBIG and a dose of hepatitis B vaccine as soon as possible after exposure, or two doses of HBIG (0.06 mL/kg), one given as soon as possible after exposure and the second 1 month later. The latter treatment is preferred for those who have not responded to at least four doses of vaccine.
- c. Exposed person has already been vaccinated against hepatitis B, and the anti-HBs response is unknown. The exposed person should be tested for anti-HBs.
- (1) If the exposed person has adequate antibody, no additional treatment is necessary.
 - (2) If the exposed person has inadequate antibody on testing, one dose of HBIG (0.06 mL/kg) should be administered immediately and a standard booster dose of vaccine administered at a different site.

2. Source of exposure known and HBsAg-negative

- a. Exposed person has not been vaccinated or has not completed vaccination. If unvaccinated, the exposed person should be administered the first dose of hepatitis B vaccine within 7 days of exposure, and vaccination should be completed as recommended. If the exposed person has not completed vaccination, vaccination series should be completed as scheduled.
- b. Exposed person has already been vaccinated against hepatitis B. No treatment is necessary.

3. Source of exposure unknown or not available for testing

- a. Exposed person has not been vaccinated or has not completed vaccination. If unvaccinated, the exposed person should be administered the first dose of hepatitis B vaccine within 7 days of exposure, and vaccination should be completed as recommended. If the exposed person has not completed vaccination, vaccination should be completed as scheduled.
- b. Exposed person has already been vaccinated against hepatitis B, and anti-HBs response status is known.
 - (1) If the exposed person is known to have had adequate response in the past, no treatment is necessary.
 - (2) If the exposed person is known not to have responded to the vaccine, prophylaxis as described earlier in section 1.b(2) under

"Source of exposure known HBsAg-positive" may be considered if the source of the exposure is known to be at high risk of HBV infection.

- c. Exposed person has already been vaccinated against hepatitis B, and the anti-HBs response is unknown. The exposed person should be tested for anti-HBs.

- (1) If the exposed person has adequate anti-HBs, no treatment is necessary.
- (2) If the exposed person has inadequate anti-HBs, a standard booster dose of vaccine should be administered.

TABLE 2. Recommendations for hepatitis B prophylaxis following percutaneous exposure

Exposed person	Treatment when source is found to be		Unknown or not tested
	HBsAg positive	HBsAg negative	
Unvaccinated	Administer HBIG x 1* and initiate hepatitis B vaccine†	Initiate hepatitis B vaccine†	Initiate hepatitis B vaccine†
Previously vaccinated			
Known responder	Test exposed person for anti-HBs 1. If adequate, no treatment 2. If inadequate, hepatitis B vaccine booster dose	No treatment	No treatment
Known non-responder	HBIG x 2 or HBIG x 1, plus 1 dose of hepatitis B vaccine	No treatment	If known high-risk source, may treat as if source were HBsAg positive
Response unknown	Test exposed person for anti-HBs‡ 1. If inadequate, HBIG x 1, plus hepatitis B vaccine booster dose 2. If adequate, no treatment	No treatment	Test exposed person for anti-HBs‡ 1. If inadequate, hepatitis B vaccine booster dose 2. If adequate, no treatment

*Hepatitis B immune globulin (HBIG) dose 0.06 mL/kg intramuscularly.

†Hepatitis B vaccine dose—see Table 1.

‡Adequate anti-HBs is ≥ 10 milli-international units.

PHYSICIANS

We are announcing opportunities for you to serve your country as an Air Force Reserve physician/officer. You can make new professional associations, obtain CME credit and help support the Air Force mission. For those who qualify, retirement credit can be obtained as well as low cost life insurance. One weekend a month plus two weeks a year or less can bring you pride and satisfaction in serving your country.

Call: (703)617-7445 or
(404)421-4892

Rosemary Hatem Bonsack, M.D., a member of the Harford County delegation to the Maryland General Assembly, was appointed chairperson of the Medical/Professional Liaison Subcommittee of the State Council of Cancer Control in January 1992. The subcommittee will monitor the expansion in the number of providers who offer integrated programs for the early de-

tection, referral, and follow-up treatment of breast and cervical cancer, and for the cessation of tobacco use under the Maryland Cancer Control Implementation Plan. The subcommittee is also charged with: increasing the number of physicians and other health care professionals who refer and follow women for mammograms and who perform or refer and follow women for Pap tests and clinical breast exams; promoting the increase in the number of physicians and other health care professionals who advise their patients to quit smoking; promoting as a standard, accredited, dedicated low-dose, and high quality mammography; and promoting the use of standardized terminology for reporting the findings of mammography and Pap test cytology. Also in January 1992, Dr. Bonsack was appointed chairperson of the Chapter Affairs Committee of the American Academy of Family Physicians (AAFP). Dr. Bonsack is also an alternate delegate to the AAFP Congress of Delegates from the state of Maryland.

Mukund S. Didolkar, M.D. was recently appointed director of the Surgical Oncology Program at the Sinai Hospital of Baltimore. A graduate of Nagpur University in India and the Royal College of Surgeons in England, Dr. Didolkar is a prolific author, having published more than seventy-five articles, books, and editorials, as well as having produced a number of films on cancer-related topics. Well-known as a public speaker, Dr. Didolkar is a board-certified surgeon who has taught at Nagpur University in India, the University of Manchester in the United Kingdom, the Roswell Park Memorial Institute in New York, the University of South Dakota Medical School, the State University of New York, and the University of Maryland. Active in numerous professional societies, he is winner of numerous awards and honors. Dr. Didolkar is married to Shaila Didolkar, M.D., F.A.C.O.G.; they have two children.

Arthur Kaufman, M.D. recently received a certificate of achievement from The Johns Hopkins National Search for

Computing to Assist Persons with Disabilities. Dr. Kaufman's PlusTag Magic Medical Record System was selected as one of the top thirty entries from a field of over 750 and, as such, was exhibited at the Smithsonian Institution. (PlusTag is a rugged, wearable card in the form of a dog tag that can be programmed to

carry a patient's medical record, including the most recent x-ray and electrocardiogram. It is intended to aid persons who, because of their disabilities, are unable to provide medical information about themselves in an emergency.) Dr. Kaufman received his bachelor's degree in sociology from Duke University, his master's degree in industrial organic chemistry from the Brooklyn Polytechnic Institute, and his medical degree from the State University of New York. Past medical director and vice-president of Forensic Medical Advisory Service, Inc., he has long been interested in quality assurance and in health care in the prison system. Dr. Kaufman has been active at the committee level for both Med Chi and the Prince George's County Medical Society. A family practitioner, Dr. Kaufman has for years been combining his interest in computer technology with his knowledge of medicine, having developed not only PlusTag but a number of computerized utilization review programs. He is currently associated with Computer Assisted Medical Solutions, Inc. in Bethesda, Maryland.

Richard M. Susel, M.D., F.A.C.S. has assumed the post of president of the St. Agnes Hospital Medical Staff after serving a one-year term as president-elect. He is also chief of the Section of Ophthalmology at St Agnes, as well as clinical assistant professor of ophthalmology at the University of Maryland Medical School, and instructor and lecturer at the Wilmer Institute. A

graduate of the University of Maryland, Dr. Susel is certified by the American Board of Ophthalmology, and is a Fellow of both the American College of Surgeons and the American Academy of Ophthalmology. From 1982 to 1987, Dr. Susel served as medical director of Tissue Bank International, and is currently a member of the Board of Trustees. He presently serves as chairperson of Med Chi's ad hoc Therapeutic and Formulary Committee. A member of the American Academy of Ophthalmology and the Maryland Society of Eye Physicians and Surgeons, he is the author of publications regarding corneal preservation and keratoplasty evaluation.

The nightmare of leech attacks while trekking in Nepal

I hope you never find yourself in leech-infested areas as I did recently while trekking in Nepal. The leech, a predacious or parasitic annelid worm of the phylum Annelida, class Hirudinea, is characterized by a cylindrical or slightly flattened body with suckers at either end for attaching to prey. Like other annelids, the leech is segmented but its numerous surface folds obscure its internal segments. In many forms, the mouth has three small jaws equipped with sharp teeth. The digestive tract has lateral pouches that hold enough of the leech's staple food—blood—to last for months. The reproductive system is complex; leeches are hermaphroditic and cross-fertilizing. Nearly all leeches are aquatic, abounding in freshwater ponds in temperate regions. Some are permanent parasites of man, horse, cattle, fish, and mollusks, but most are merely predatory. The salivary secretions of the leech contain hirudin, an anticoagulant. Medicinal leeches, once used by physicians to bleed patients suffering from almost any ailment, are now used in some parts of the world for the treatment of bruises such as black eyes. Certain small leeches of the eastern Mediterranean region may enter the bodies of humans and animals through drinking water and lodge as parasites in the mouth or the respiratory passages.

I asked a number of people about the best defense against leeches. I was told that I should keep my trousers tucked in my socks, that it was unlikely that insect repellents would work (as repellents probably only worked against mosquitos and other flying insects), and that if a leech were to attach itself to me, I should touch a lighted cigarette to the back of the leech in order to make it release its bite. So when the heavy rains came unexpectedly to the area in which my colleagues and I were trekking and leeches appeared literally by the millions, we found ourselves with virtually no defenses.

The leeches ranged in size from about one quarter inch to six inches. They were as thin as a matchstick before they sucked our blood and as swollen as a cigarette after. If I have nightmares, I know the villains will be those whitish creatures! They would inch up our shoes, legs, and bodies. I found one full of blood on my head. Evolution has been so successful in preparing them for their bloodsucking that it was rare that we could feel by touch when they crawled over our skin. Only by sight could we find them. Frequently, there were thirty or more on each of us at any instant. We were pulling off thousands of them in a few hours. My guide, who was Nepalese and had holes in his shoes, was bleeding profusely and was slushing blood in his socks. My own socks were also soaked with blood. Even after we removed the leeches from our bodies, we continued to bleed for one-half hour or longer. It was so hot that if we kept our trousers on,

we just poured sweat, but trousers did offer some leech protection. If we took our trousers off, we got leeches up and down our exposed legs, although we were a little cooler—it seemed hopeless.

It was going to take more than one hour to get out of the leech area. We were in Nepal, between Dhamdus and Nuanda, more or less 100 miles west of Katmandu. In desperation, the thought occurred to me—what do I have to lose by using my insect repellent that I was carrying for mosquitoes and flying insects? The leeches withered, twisted, and fell off when touched by *Jungle Juice* by REI, and we began to smear it on over clothes and shoes. The leeches would now climb up on our shoes and fall away, and we experienced a great sense of relief. I am passing this information on to editors of several medical journals I read and to travel agent friends who have clients going to leech-infested areas, hoping the good news will spread. (I hope this does not release a deluge of letters from animal rights groups, who attack me for killing leeches.) I have also contacted the president of REI and suggested that the company add leeches to the insects *Jungle Juice* can repel.

I will be happy if this information prevents one or more people from suffering a leech experience such as I survived. The film *African Queen* portrays something of how it felt.

My second purpose is to inquire if any medical care providers, physicians, pharmacists, or nurses know what is being done to help the Nepalese address health problems? "One-fifth of the babies do not survive beyond the first few weeks of life, men live an average of 44 years, and women hardly three more," according to *Our World in Colour Nepal*, one of the most beautiful and pleasing books I've ever enjoyed (published by Publishers Group West, Inc., 4065 Hollis, Emeryville, California 94608). (*Nepal*, published by The Lively Plant, POB 2001A, Berkley, California 94702 is also almost indispensable as part of your travel survival kit.)

I am considering volunteering or helping organize physician volunteers. Right now, I am just gathering information. If any reader would like a summary of what I have learned by about this time next year, please send a large self-addressed, postage-paid envelope to Charles Farwell, M.D., 11406 Viers Mill Rd., Wheaton, MD 20902-2574. My next trip to Nepal will be in October/November 1992, and I will gladly mail anyone what I have learned from organizations like Hope, American Friends Service Committee, World Health Organization, and others by February 1993.

CHARLES FARWELL, M.D.

Dr. Farwell is a family practitioner from Wheaton, MD. ■

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation

A live program

Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.

Broadcast across the country

An hour-long program

Call-in format: Physician answers questions from listeners

Sunday Morning Consultation

A pre-taped program

Sunday at 7:30 a.m.

Broadcast on WBAL - AM radio

A half-hour program

Interview format: one-on-one talk with John Stupak

For more information, contact Lori Robinson at 539-0872 (Baltimore area) or at 1-800-492-1056 (toll-free from elsewhere in Maryland).

PHYSICIANS WANTED

Semi-retired or retired physicians for pleasant office practice part-time. Call 547-2686.

OB-GYN CHIEF

Maryland General Hospital, Inc., a growing and dynamic 276-bed teaching hospital with a 100 year tradition of excellence, is seeking a chief for our busy OB/GYN Department. The ideal candidate will be board certified and have a current Maryland license (or be eligible for a Maryland license). Individual will manage the OB/GYN Department and the residency training program. This is a 20-hour per week position, classified as geographic full-time for benefit purposes, and allows for private practice in addition to Chief's duties. We offer a competitive base salary and an excellent benefits package. For complete details please contact: John Manzari, M.D., Vice President of Medical Affairs, Maryland General Hospital, Inc., 827 Linden Avenue, Baltimore, Maryland 21201 (410-225-8295). E.O.E. - M.F.H - Drug Screening Required.

CHAIRPERSON

DEPARTMENT OF SURGERY

Candidates are being sought for the position of Chairperson of the Department of Surgery. This is designated as a part-time position and individuals must be Board certified in General Surgery. Prior experience in the area of quality assurance and general administrative duties is desired. Responsibilities include ongoing clinical and quality improvement activities, credentialing functions, and direction of the Department of Surgery. Candidates should forward their curriculum vitae and the names of three professional references to Mr. James O. Dague, CEO, Bon Secours Hospital, 2000 West Baltimore Street, Baltimore, Maryland 21223.

INTERNAL MEDICINE

Baltimore area busy Internal Medical group practice looking for third board certified/board eligible Internist. Excellent practice opportunity, great location. Send CV to K. Glick, M.D., 20 Crossroads Drive, Suite 12, Owings Mills, MD 21117.

INTERNIST/FAMILY PRACTITIONER

Bd. Cert. or Bd. eligible, full-time for HMO facility in Catonsville area. Challenging environment with exc. benefits and salary. Contact Dianne McLean at 876-9680.

AMA LOCUM TENENS SERVICE

Increasing numbers of physicians across the country are choosing to work as locum tenens because of the benefits offered through this style of practice—freedom with financial security, professional and personal challenge, adventure, and travel. Many physicians relish the freedom that locum tenens positions allow them. It is an ideal situation for those who enjoy travelling, continually meeting new people, and encountering challenges. They are relieved from the burden of practice management and the responsibilities of owning their own practice. Locum tenens have more time to concentrate on matters of personal interest. For more information on AMA Locum Tenens Service, call 1-800-955-3565.

THORACIC SURGEONS: BROADEN YOUR EXPERIENCE.

Your time and talent are valuable. They're valuable to the Army Reserve, too. We'll pay you for a small fraction of your time, not only in money, but with big opportunities and challenges you won't find in civilian practice.

- You'll have flexibility in how and when you participate.
- You'll be offered conferences and continuing education.
- You'll have opportunities for military training in areas like Advanced Trauma Life Support, Parachuting, Flight Medicine and Mountaineering.
- You'll work with top, dedicated professionals.
- You'll have the rank and privileges of an Army officer.

If you want more information about the Army Reserve, or if you would like to talk to an Army Reserve physician, our experienced Army Medical Counselors can assist you. Call collect or write:

MAJOR MICHAEL W. SALMONS
American City Bldg. S-307 • Columbia, MD 21044

For the many faces of mild hypertension

THE MOST WIDELY USED CALCIUM ANTAGONIST AS MONOTHERAPY FOR MILD HYPERTENSION^{1*}

- Effective 24-hour control²
- Single-agent efficacy
- Well tolerated[†]
- No adverse effects on total cholesterol, plasma glucose levels, renal function,[‡] or serum electrolytes³⁻⁶

For the many faces of mild hypertension

*The recommended starting dose for Calan SR is 180 mg once daily. Dose titration will be required in some patients to achieve blood pressure control. A lower initial starting dosage of 120 mg/day may be warranted in some patients (eg, the elderly, patients of small stature). Dosages above 240 mg daily should be administered in divided doses. Calan SR should be administered with food.

†Constipation, which is easily managed in most patients, is the most commonly reported side effect of Calan SR.

‡Verapamil should be administered cautiously to patients with impaired renal function.

BRIEF SUMMARY

Contraindications: Severe LV dysfunction (see *Warnings*), hypotension (systolic pressure < 90 mm Hg) or cardiogenic shock, sick sinus syndrome (if no pacemaker is present), 2nd- or 3rd-degree AV block (if no pacemaker is present), atrial flutter/fibrillation with an accessory bypass tract (eg, WPW or LGL syndromes), hypersensitivity to verapamil.

Warnings: Verapamil should be avoided in patients with severe LV dysfunction (eg, ejection fraction < 30%) or moderate to severe symptoms of cardiac failure and in patients with any degree of ventricular dysfunction if they are receiving a beta-blocker. Control milder heart failure with optimum digitalization and/or diuretics before Calan SR is used. Verapamil may occasionally produce hypotension. Elevations of liver enzymes have been reported. Several cases have been demonstrated to be produced by verapamil. Periodic monitoring of liver function in patients on verapamil is prudent. Some patients with paroxysmal and/or chronic atrial flutter/fibrillation and an accessory AV pathway (eg, WPW or LGL syndromes) have developed an increased antegrade conduction across the accessory pathway bypassing the AV node, producing a very rapid ventricular response or ventricular fibrillation after receiving I.V. verapamil (or digitalis). Because of this risk, oral verapamil is contraindicated in such patients. AV block may occur (2nd- and 3rd-degree, 0.8%). Development of marked 1st-degree block or progression to 2nd- or 3rd-degree block requires reduction in dosage or, rarely, discontinuation and institution of appropriate therapy. Sinus bradycardia, 2nd-degree AV block, sinus arrest, pulmonary edema and/or severe hypotension were seen in some critically ill patients with hypertrophic cardiomyopathy who were treated with verapamil.

Precautions: Verapamil should be given cautiously to patients with impaired hepatic function (in severe dysfunction use about 30% of the normal dose) or impaired renal function, and patients should be monitored for abnormal prolongation of the PR interval or other signs of overdosage. Verapamil may decrease neuromuscular transmission in patients with Duchenne's muscular dystrophy and may prolong recovery from the neuromuscular blocking agent vecuronium. It may be necessary to decrease verapamil dosage in patients with attenuated neuromuscular transmission. Combined therapy with beta-adrenergic blockers and verapamil may result in additive negative effects on heart rate, atrioventricular conduction and/or cardiac contractility; there have been reports of excessive bradycardia and AV block, including complete heart block. The risks of such combined therapy may outweigh the benefits. The combination should be used only with caution and close monitoring. Decreased metoprolol and propranolol clearance may occur when either drug is administered concomitantly with verapamil. A variable effect has been seen with combined use of atenolol. Chronic verapamil treatment can increase serum digoxin levels by 50% to 75% during the first week of therapy, which can result in digitalis toxicity. In patients with hepatic cirrhosis, verapamil may reduce total body clearance and extrarenal clearance of digoxin. The digoxin dose should be reduced when verapamil is given, and the patient carefully

monitored. Verapamil will usually have an additive effect in patients receiving blood-pressure-lowering agents. Disopyramide should not be given within 48 hours before or 24 hours after verapamil administration. Concomitant use of flecainide and verapamil may have additive effects on myocardial contractility, AV conduction, and repolarization. Combined verapamil and quinidine therapy in patients with hypertrophic cardiomyopathy should be avoided, since significant hypotension may result. Concomitant use of lithium and verapamil may result in a lowering of serum lithium levels or increased sensitivity to lithium. Patients receiving both drugs must be monitored carefully. Verapamil may increase carbamazepine concentrations during combined use. Rifampin may reduce verapamil bioavailability. Phenobarbital may increase verapamil clearance. Verapamil may increase serum levels of cyclosporin. Verapamil may inhibit the clearance and increase the plasma levels of theophylline. Concomitant use of inhalation anesthetics and calcium antagonists needs careful titration to avoid excessive cardiovascular depression. Verapamil may potentiate the activity of neuromuscular blocking agents (curare-like and depolarizing); dosage reduction may be required. There was no evidence of a carcinogenic potential of verapamil administered to rats for 2 years. A study in rats did not suggest a tumorigenic potential, and verapamil was not mutagenic in the Ames test. Pregnancy Category C. There are no adequate and well-controlled studies in pregnant women. This drug should be used during pregnancy, labor, and delivery only if clearly needed. Verapamil is excreted in breast milk; therefore, nursing should be discontinued during verapamil use.

Adverse Reactions: Constipation (7.3%), dizziness (3.3%), nausea (2.7%), hypotension (2.5%), headache (2.2%), edema (1.9%), CHF, pulmonary edema (1.8%), fatigue (1.7%), dyspnea (1.4%), bradycardia: HR < 50/min (1.4%), AV block: total 1°, 2°, 3° (1.2%), 2° and 3° (0.8%), rash (1.2%), flushing (0.6%), elevated liver enzymes, reversible non-obstructive paralytic ileus. The following reactions, reported in 1.0% or less of patients, occurred under conditions where a causal relationship is uncertain: angina pectoris, atrioventricular dissociation, chest pain, claudication, myocardial infarction, palpitations, purpura (vasculitis), syncope, diarrhea, dry mouth, gastrointestinal distress, gingival hyperplasia, ecchymosis or bruising, cerebrovascular accident, confusion, equilibrium disorders, insomnia, muscle cramps, paresthesia, psychotic symptoms, shakiness, somnolence, arthralgia and rash, exanthema, hair loss, hyperkeratosis, macules, sweating, urticaria, Stevens-Johnson syndrome, erythema multiforme, blurred vision, gynecostasia, galactorrhea/hyperprolactinemia, increased urination, spotty menstruation, impotence.

Our Members Are Not Dying For A Free Tail.

Strangely enough, some companies are trying to sell Maryland physicians a professional liability policy that requires them to die or become permanently disabled in order to get a free tail. At Medical Mutual, our members can get a free tail while they are very much alive.

We make the tail available at no extra cost for those of you who are planning to retire from the practice of medicine after five consecutive years on our claims made and/or occurrence policy. If retirement is not in your plans, our tail is free at any age after 15 consecutive years on our claims made policy. As an added feature, you may step down from a higher rated specialty to a lower rated one with no tail charge for making the change.

Your broker or our Member Services Representatives can answer your questions about tail provisions for Medical Mutual members.

Of course, we also give a free tail in the event of your permanent disability or death.

We just don't think this should be your only choice.

STATE OF THE ART

DIAGNOSTIC TECHNOLOGY

Magnetic resonance imaging (MRI) is an important tool for today's physician. MRI produces VIVID images of the body in multiple planes. It is a painless procedure that does not involve surgery or potentially harmful radiation. MRI is frequently recommended for evaluation of neural, spinal, articular and pelvic disorders. It is safe and cost effective, and its various applications are being expanded at an impressive rate.

Health Images facilities are a community resource available to all area physicians.

The MRI Company

At MetPath, the reason we set the highest standards for ourselves is simple:

Our Clients Put Us To The Test Everyday.

When you're put to the test millions of times a year, you have to be the best. Our skilled laboratory professionals use the latest technology, instrumentation and methodologies to provide the most accurate results. And we constantly strive to improve our service through continuing employee education and stringent quality assurance programs. In fact, our broad experience and attention to detail has helped us earn an exceptional proficiency rating — just what clients expect

when accuracy is critical. And while technology and quality assurance programs are important in our business, the most essential element at MetPath is our people. Each employee is committed to providing the very best service.

As our client, you can rely on our employees to meet the constantly changing needs of your practice. For accuracy, experience, dedication, and the highest standards in the industry, MetPath comes through time and again.

Put us to the test and see for yourself.

MAY 1992

VOLUME 41 NO 5

Jose M. Yosunico, M.D. 1992–1993 Med Chi President 385

Betsy Newman

"Med Chi is a great organization," Says Dr. Yosunico. "Whatever I try to do during my year as president, I'm going to give one hundred percent. I'm a team player. That's my style."

Lyme disease in Maryland: 1987–1990 391

Clifford S. Mitchell, S.M., M.D., M.P.H.; Marianne Cloeren, M.D., M.P.H.; Ebenezer Israel, M.D., M.P.H.; Christina Lazar, M.D.; and Brian S. Schwartz, M.D., M.S.

We describe the epidemiology of Lyme disease in Maryland for 1987 to 1990 when the number of cases reported grew from 23 to 448 and the number of cases meeting the CDC case definition grew from 23 to 238, as well as discuss the implications of increased reporting and diagnosis of Lyme disease.

The clinical use of histamine-2 receptor antagonists 397

Robert J. Michocki, Pharm.D. and James P. Richardson, M.D.

Histamine-2 receptor antagonists have been available for fifteen years for the treatment of peptic ulcer disease and related disorders. While very safe, clinicians need to know correct dosing guidelines, drug interactions, and side effect profiles. Long-term therapy should be reserved for patients at high risk of recurrence.

Normal sexual development of children:

Physician roles in bridging gaps in parent-child communication 401

Steven H. Lipsius, M.D., M.P.H., F.A.P.A.

Physicians have opportunities to help a child have pride about his or her body, support the child's sexual self, and encourage shame-free limit setting. By supporting a parental coalition that is resilient and indivisible, physicians help children value their gender role and may influence the outcome of sexual orientation.

Journey of the Maryland International Health Task Force

to post-war Kuwait: May 19–27, 1991 407

The Kuwait 38

Thirty-eight physicians, nurses, hospital administrators, and support personnel—members of the Maryland Medical Task Force—journeyed to Kuwait in May 1991. The experience sensitized members of the Maryland delegation to the specific needs of post-war Kuwait in rebuilding its health care system.

Update on health status in Kuwait 412

James P.G. Flynn, M.D., M.P.H.

Medical History—James McHenry, M.D. of Fort McHenry in Baltimore Towne 413

Joseph M. Miller, M.D.

James McHenry, M.D., whose name is best known for the fort immortalized in the *Star Spangled Banner*, was one of the early members of Med Chi. In addition, he was secretary to George Washington; aide to Lafayette; member of the Maryland Senate, the General Assembly of Maryland, and US Congress; and signer of the Constitution.

Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

Editorial

Professional courtesy: A bygone era

Is professional courtesy dead? For as long as anyone can remember, physicians have provided professional services, without charge, to other physicians and their immediate families. Indeed, physicians considered it to be a compliment that they had been chosen to care for their peers. ■

The Hippocratic oath says, ".... and I will keep this oath and stipulation: To reckon him who teach me this art equally dear to me as my parents, to share my substance with him, and relieve his necessities if required; to regard his offspring as on the same footing with my own brothers" The American Medical Association Code of Ethics proposes that a physician "cheerfully and without recompense give his professional services to physicians or their dependents."¹ In spite of these moral and ethical historical statements, one suspects that professional courtesy has gone the way of the house call and black and white television. The system has gone over to the "robot physician" and computerized office management.

When I began practice almost fifty years ago, professional courtesy was a community standard from which one never considered deviating. Charging one's peers or immediate relatives was not done and was just cause for ostracism from the medical community. Occasionally, the clergy, nurses, dentists, pharmacists, and close associates were also granted professional courtesy. This was more of a policy in small towns than in urban areas. Most medical practice consultants agree that professional courtesy—not only to fellow physicians, but also to such people as pharmacists and hospital personnel—is an excellent practice builder.

Curiously, psychiatrists almost never gave complete professional courtesy on the grounds that there were only a limited number of hours in the day that could be productive, and that the therapy would be more effective if it were costly. I have never understood this reasoning since these grounds would

seem to apply to the care provided by all physicians.²

The times have changed. The erosion of the code of professional courtesy has come about by urbanization, computerization, and third party payers. The list of persons to whom professional courtesy was offered gradually condensed. The first to be deleted were the clergy and pharmacists; then the nurses and dentists were asked to pay a specific percentage of the full fee. Many older physicians, however, who were set in their ways and imbued with the honor and pride of the custom, continued their professional courtesy practices.

Nevertheless, changes were being made in the tradition, and younger physicians limited the practice to physicians, their spouses, and their dependent children. The art of medicine had been transformed into the business of medicine. Some physicians rationalized that they were giving away too much free time, that with rising office overhead and huge home mortgage payments, they could no longer afford the luxury of professional courtesy. Now, much more importance is attached to money and the material things that it can buy than in the old days.

A survey conducted recently by *Medical Economics* revealed that professional courtesy provided by the typical physician isn't likely to exceed 2 percent of the total value of his or her services in a given year.³ In return, isn't that small cost repaid by patient referrals from the person receiving the professional courtesy and by the receipt of professional courtesy care for the provider's spouse and children? In addition, there is the prestige and honor of having been selected by a fellow physician to provide medical care for his or her peers in the community.

It is possible, in certain specialized practices, that the value of free care might be a real financial burden. In such cases, a drastic cutback is called for. Most doctors are uncertain how much professional courtesy is costing and, if in doubt, should consider keeping dollar records on such patients for at least several months.

Nowadays, it is a common practice for physicians to have health insurance for their families. Most physicians will accept insurance payments for the professional courtesy treatment provided. This allows the recipient of the care to feel justified in taking up the physician's time and eliminates the chore of looking for a gift for the donor of the care. Years ago it was considered an insult to even offer insurance coverage for the care of a fellow physician or the physician's family. Times have changed, and most physicians now accept any insurance payment as full payment for the care provided.

Courtesy allowances should apply to the time provided by the physician only and not to items such as x-rays, expensive injections, and laboratory procedures. If insurance payments do not reimburse for these procedures, the recipient of the care should insist upon paying the dollar amount involved.

Many multiphysician centers have a separate billing office and a physician may not know how much money is being passed. The impersonal corporation knows nothing of professional courtesy; all it knows is the bottom line. The practice of medicine has become so impersonalized that beneath the surface, an adversarial relationship often exists between the doctor and the patient. This hardly lends itself to professional courtesy.

Physicians may pretend that they don't know what is going on in their own office and so erase themselves from the equation. This is a poor excuse and should be a source of embarrassment to a really dedicated physician.

Another factor in the reduction of professional courtesy is the third party payment system. It compensates a certain amount and then calculates what the patient should pay the physician. Weeks or even months after the visit, the business clerk, either through ignorance or feigned ignorance, bills the physician-patient for the balance. Business is business.

If There is Alzheimer's Disease...

Church Home has been caring for men and women with Alzheimer's Disease since 1987 in a small and very special place we call the Broadway Wing.

The Wing is physically separate from Church Home but, like the Home, directly connected to Church Hospital. It is restful and secure. There are 22 private rooms and an enclosed garden. Nowhere in the Baltimore area is there a nursing staff better prepared—by training, experience, and temperament—for their profession.

One monthly charge covers virtually everything. There will be no hospital bills, no doctors' bills, no bills for medicines. And there is no entrance fee.

For more information or to arrange a visit to the Broadway Wing, call 732-1410.

Quality Service to Our Physicians and Patients!

IF YOU'RE LOOKING FOR A LUXURY HOME, LOOK FOR ONE THAT'S AFFORDABLE.

RIVER FALLS
Potomac's Family Community.

From a strictly financial aspect, River Falls homes have performed admirably. Through the ups and downs over the past 23 years, they've posted a track record of significant appreciation and lasting durability. Marketability that's a testament to timeless designs, construction by teams of in-house craftsmen, and one of the most beautiful, convenient locations in the Potomac/Bethesda area.

These days, it's hard to find an investment that's both prudent and rewarding. Which is why right now is the time to consider the advantages of investing in a River Falls luxury home. You've never had more going for you.

*Why River Falls
is today's best buy.*

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities

Today, a River Falls home is still an eminently affordable investment and a smart one too. Four-to-six bedrooms start in the \$600's with absolutely no compromise in quality. There's terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go well beyond dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs. Nearby are excellent public and private schools, convenient shopping and easy access to suburban Maryland, downtown D.C., and Northern Virginia.

Where else can you get such a sound investment with such outstanding returns? Take an hour to visit River Falls and see how great your future can be. For you, and for your family.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.
HOURS: 12-5 daily.

PHONE: (301) 299-3700.

Brokers welcome.

The state of heads

Bart Gershen, M.D.

One of the unique signs of portal hypertension is the *caput medusae*, a cluster of dilated periumbilical venules. The name was obtained from its resemblance to Medusa, the mythologic Gorgon, whose body was covered with dense scales, whose head was covered with snakes, and whose gaze turned people to stone.

The word *caput* in Latin means 'head'. Presumably the coiled, twisted, and distended abdominal vessels reminded some romantic clinician of Medusa's serpentine tresses.

Of course *caput* has spawned several words which we use more commonly. **Capitation** is a method of compensation per head. Insurance companies employ that term frequently—but not often enough. The apparel men and boys wear for fun—a **cap**—also originates from *caput*. **Capital** punishment derives from a rather nasty method of exterminating the criminal—by **decapitation**. (**Capital** is also used to define the city that contains the head—although it's more often the seat—of our government.) The leader of a military force or of a large industry is often called a **captain**.

Wealth in the form of money or property is also referred to as **capital**, since it belongs to one person. In Middle English, the word evolved to **chattel**—referring to one's belongings or possessions. Thus the term **chattel mortgage**. In fact, a variant of chattel became **cattle** since they often represented a man's entire capital wealth. (How many **head of cattle**, therefore, becomes almost redundant.)

In publishing, arranging an index by headings was to **capitulate** them. Soon this word was employed to specify terms of surrender or capitulation. When a French knight was outfitted from head to foot it was known as *cap-a-pie* (*pie* from the Latin *pes* 'foot' which became the French *pié*.) *Cap-a-pie* soon came to mean 'in fine shape'. But when Americans heard the term, they understood it as 'apple-pie'. Thus the phrase, "everything's in apple pie order."

A bandage shaped like a cap and used to cover a head wound or the stump of an amputated limb is called a **capeline**. (The material from which a bandage is most often fashioned is **gauze**, named for the mid-east city from which it originated—Gaza.) The Latin for bandage was *fascia*—a

word also used to signify a sheet or bundle of fibers, as in **Buck's fascia** of the penis (named for Gurdon Buck, a nineteenth century American surgeon).

Ancient Roman magistrates were always preceded into the city by lictors, who heralded their arrival. This was accomplished by requiring the lictors to carry long poles onto which were mounted bundles of birch rods tied together with red bands. Thrust into the middle of those clusters was the protruding blade of an ax. These bundles of sticks were called *fascies* and represented the united authority of the Roman government.

In 1919, Benito Mussolini organized a group of revolutionaries and made use of this ancient Roman symbol of solidarity. He called his new party the Partito Nazionale Fascista—the fascist movement.

A cloak with a hood is called a **cape**. The term has evolved from *caput* through *cappa* to *capella* and finally to **cape**. (A projection of land into a body of water—or a headland—is also known as a **cape**.) In the third century A.D., a Frenchman named Martin left his home in Tours to join the Roman legions. One morning, at the gates to the city of Amiens, he saw a poor, frightened man trembling with cold. Martin ripped his cape in two and offered half to the beggar. The other half he wrapped about his own shoulders and rode off.

After his death, Martin was elevated to sainthood and the torn cape became an object of worship. It was preserved by the Frankish kings who took it with them into battle and sheltered it in a special tent. During peacetime, it was solemnly maintained in a dedicated room within their castle. The room became known as the cape room and was thus called the *capella*. The guardian of the cape came to be known as a *capellanus*. Slowly, as Latin evolved into French, the room became known as a *chapele* and its warden known as the *chapelain*. Worship services began to be held in this special place. We know it today as a chapel and its chaplain.

The church choir often practiced in this room. Since no organ was present, the choir sang without musical accompaniment. It was known as singing a *capella*—according to the chapel. ■

Our Pictures Are Worth A Thousand Words.

#Case 20

A 67 year old female with severe headaches, sinusitis and history of recent tooth extraction.

DIAGNOSIS: BRAIN ABSCESS right cerebral hemisphere.

Figure 1 demonstrates a 3 cm. hyperintense mass abutting the brain surface of the occipitoparietal lobes. A peripheral thin rim of hypointensity surrounds the lesion (arrows) and diffuse hyperintense signal extends through the adjacent white matter consistent with vasogenic edema. Figure 2 demonstrates a post Gadolinium enhanced T1 weighted scan. The central area of hypointensity corresponds with necrosis. The peripheral rim of contrast enhancement represents the abscess capsule. Double arrow demonstrates abnormal contrast enhancement of the leptomeninges.

The differential diagnosis of a ring enhancing lesion includes high grade astrocytoma, metastasis, infarction (bland or septic), and resolving hematoma. MRI can be extremely helpful in differentiating focal cerebritis from abscess. This is important as the former is treated medically and the latter is typically surgically drained and/or excised. Serial MRI scans also demonstrate decrease in edema, mass effect and degree of enhancement during follow-up.

FIGURE 1

FIGURE 2

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and weekend hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

You work hard to gain your patients' trust and confidence. At Drs. Copeland, Hyman & Shackman, we'll help you keep it.

Executive Director's Newsletter

May 1992

Jose M. Yosuico, M.D.,
New Med Chi President

On May 2, 1992, Jose M. Yosuico, M.D. will become Med Chi's 132nd president. As president for 1992-1993, Dr. Yosuico hopes to increase Med Chi's membership, and is calling for increased teamwork during these challenging times. For more on Dr. Yosuico, see his article on page 385 of this *MMJ*.

Component Society
Presidents

For the second consecutive year, the *MMJ* is publishing biographies of Med Chi's component medical society presidents. We hope you take time to look at pages 427-433 of this *MMJ* to read about these important leaders of organized medicine.

HCFA Correcting
Payments

The American Medical Association has reported that the Health Care Financing Administration (HCFA) has instructed its carriers to establish adjusted historical payment bases (AHPBs) for approximately 40 CPT codes that were new in 1991 or 1992 because HCFA discovered that the transition rules were incorrectly applied when the 1992 payment amounts were calculated. Because the AHPBs were set at zero, these codes went immediately to the full RBRVS payment schedule with no transition. HCFA is now providing "crosswalks" to old codes to be used by carriers in establishing AHPBs. This situation will probably result in new 1992 payment amounts for these procedures.

Furthermore, the relative value units for approximately 150 technical component codes and the related global code will be changed as a result of a new methodology to calculate the technical components. Carriers should be notifying providers of the new payment amounts and charge limits by April 30, 1992.

NOTE: Carriers have been instructed to **reopen** any claims for services submitted after December 31, 1991 that are brought to their attention for correction. Carriers do not have to make up for any underpayments to physicians. Therefore, physicians should carefully review the new payment amounts to see if they are due any additional payment.

Thank You to "Doctor of
the Day" Volunteers

Med Chi thanks all 46 physicians who participated in the 1992 "Doctor of the Day" program in Annapolis. Volunteer physicians served during the legislative session and treated a variety of ills. Med Chi appreciates the help of all the physicians who helped make this year's program a great success.

1992 Med Chi
Semiannual Meeting

Med Chi's Semiannual Meeting will be held Friday, Saturday, and Sunday, September 18, 19, and 20 at the Princess Royale Hotel in Ocean City, Maryland. Watch the June issue of the *Maryland Medical Journal* for a Call for Papers for this meeting.

G.W.U. Intern

Ms. Rose Mahoney, a graduate of George Washington University's health care administration program, recently joined Med Chi as part of her residency under the preceptorship of Angelo J. Troisi, F.A.C.H.E., Executive Director.

Public Health Programs

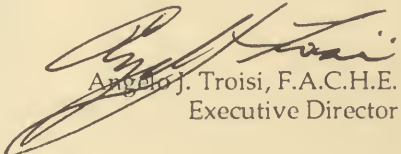

The George Washington University is offering a variety of summer health policy programs for health care providers. From June 17-19, 1992, the university will offer three concurrent conferences:

- Bioethics and Health Policy Conference
- Environmental/Occupational Health Symposium
- International Health and Development Forum

On June 22-26, the university will sponsor a summer health policy institute on Federal Health Policy: A Detailed View of the Issues and the Process. For more information about any of these programs, contact Martha Cosgrove, Senior Education Specialist for George Washington University, at 202-994-4536.

New CPT Evaluation and Management Codes for 1992

In a continuing effort to keep you apprised of the latest developments in CPT evaluation and management codes for 1992, Med Chi is pleased to provide you with the final section of this series of commonly asked questions. The listing, which was prepared by the Health Care Financing Administration, follows this newsletter.

Angelo J. Troisi, F.A.C.H.E.
Executive Director

New CPT Evaluation and Management Codes for 1992 Questions and Answers

(These questions are the final part of a listing of commonly asked questions about CPT codes. To review the first two lists of questions see the March and April editions of Executive Director's Newsletter)

21. What are the payment implications for modifier "-78" and modifier "-79"?

Modifier "-78" — Return to the operating room for a related procedure during a postoperative period. The physician may need to indicate that a procedure was performed during the postoperative period of another procedure. When this subsequent procedure is related to the first procedure and requires the use of the operating room, this circumstance may be reported by adding the modifier "-78" to the related procedure.

If this modifier is reported with an unlisted procedure code, the Medicare payment is based on up to 50 percent of the intraoperative value of the original procedure. If this modifier is reported with a specific procedure code that describes the services performed, payment is based on the intraoperative portion of the service.

Modifier "-79" — Unrelated procedure by the same physician during a postoperative period. The physician may need to indicate that the performance of a procedure

or service during the postoperative period was unrelated to the original procedure. This circumstance may be reported by using the modifier "-79."

If this modifier is reported, payment may be made at the full value of the unrelated procedure.

22. Will Medicare pay for a visit and a procedure on the same day if reported by the same physician for the same patient?

Medicare will not pay separately for a visit on the same day as a minor surgery or endoscopic procedure unless other significant, separately identifiable services are performed in addition to the procedure. The payment amount for the procedure covers such pre- and post-service work as recordkeeping, counseling and prescribing recovery therapy. However, if other significant evaluation and management services are performed on the same day, the physician may bill for the visit with modifier "-25." In determining the level of visit to bill with the modifier,

physicians should consider only the content and time associated with the separate evaluation and management service, not the content or time of the procedure.

Visits that are related to a major surgery are not paid for separately if reported by the same physician on the same day as the surgery. However, the initial evaluation or consultation by the surgeon will be paid for separately even if reported on the same day.

23. Will Medicare pay for an evaluation and management service and a diagnostic procedure for the same patient on the same day?

If the diagnostic procedure is considered a surgical procedure or is an endoscopy, the rules on payment for evaluation and management services described in the response to question number 23 apply. Medicare will pay for medically necessary evaluation and management services reported on the same day as other diagnostic procedures such as laboratory tests or radiological examinations.

24. Can code 99211 be reported if a nurse in the physician's office provides instruction on self-administering insulin?

The definition of code 99211 is as follows: Office or other outpatient visit for the evaluation and management of an established patient that may not require the presence of a physician.

Yes. If a limited service is performed by a physician's employee, this code may be used to report services that may not require personal performance by a physician. However, this code should not be reported in addition to other evaluation and management services performed by the physician on the same day.

25. In what situations will electrocardiogram (EKG) interpretations still be payable under the Medicare program?

Carriers should assume that EKG interpretations are always "performed or ordered in conjunction with a visit or consultation." This assumption is valid even if no visit or consultation is reported. For example, an orthopedist is called in on an emergency basis to perform hip surgery, examines the patient and orders an EKG prior to surgery to rule out a heart problem. Payment cannot be made to a cardiologist for the EKG interpretation because it was ordered in conjunction with the orthopedist's visit or consultation. This is true even if the orthopedic surgeon chooses not to report the patient encounter.

26. In the Medicare program, nurse practitioners and physician assistants are paid 80 percent of the lower of the reasonable charge or the applicable percentage of the fee schedule. How will this rule be applied to the visit services since there are no customary or prevailing charges for these services in 1992?

For 1992, carriers should base Medicare payments on the lower of the actual charge or the applicable percentage of the fee schedule. Since the visit code definitions changed, carriers did not do a reasonable charge update

for 1992. HCFA is not asking carriers to "gap fill" reasonable charges for this purpose. For 1993, customary and prevailing charges can be developed from January 1, 1992 through June 30, 1992 data. (The normal reasonable charge update period would be July 1991 through June 1992, but since the new visit codes won't go into effect until January 1, 1993, carriers will use six months of data for the 1993 reasonable charge update).

27. If modifier "-21" is used by a non-participating physician, how is the Medicare limiting charge applied?

Modifier "-21" is used for unusual evaluation and management services. This modifier has no effect on payment; therefore, the limiting charge is the same for the code with no modifier. At this time, HCFA plans to review these claims on a postpayment basis in order to collect information on the use of this modifier.

28. Now that modifier "-75" has been deleted from the CPT book, how will Medicare carriers identify concurrent care? How will concurrent care be paid?

Concurrent care will be recognized by carrier claims processing systems. Systems will identify instances where two physicians submit claims for visits to a patient on the same day. If the care of two physicians is medically necessary, Medicare will pay for the services of both physicians. Generally, if the physicians are of different specialties and are caring for different conditions, the services will be considered medically necessary.

29. If Medicare is the secondary payer and the primary insurer uses the old visit codes, will Medicare then accept the old visit codes?

For the month of January 1992, Medicare will accept the old visit codes whether it is the primary or secondary payer. After January 31, 1992, carriers will suspend the claim and request that the physician provide the new visit codes. Carrier will request the new codes even when the primary payer made payment under the old visit code. Secondary payment will be based on the difference between what the primary payer paid and the new code that the physician provides.

30. In a nursing facility, will Medicare pay for both a psychotherapy service and a nursing facility visit on the same day for the same patient? May a psychiatrist report either a CPT psychiatric visit code or a generic evaluation and management code? If yes, will Medicare pay for both services on the same day?

Depending on the services provided, Medicare will pay for the appropriate service -- either the psychiatric visit or the generic evaluation and management (E/M) service. Medicare will not pay for both services on the same day for the same patient.

31. Will Medicare pay ophthalmologists for either the CPT generic visit codes or the CPT ophthalmology codes (92002-92014)?

Yes. Ophthalmologists may use either set of codes.

32. Now that the 1992 CPT book has a new ophthalmological code for refraction (code 92015), should the AP modifier be reported if a refraction is not done?

No. Physicians should charge separately for the visit and refraction and not use the AP modifier. Medicare carriers will assume this is the way physicians are reporting to Medicare.

33. How do independent physical therapists and physicians report physical therapy to Medicare? Do they report CPT therapy codes, or CPT general visit codes, or the HCPCS codes M0005-M0008? When they choose to use the CPT codes instead of the HCPCS codes, will Medicare pay for a visit and the modality/treatments if they are provided on the same day?

Independent physical therapists and/or physicians may bill for physical therapy to Medicare using either the HCPCS M codes (visit with modalities and/or treatments) or using the CPT therapy codes. They may not report both HCPCS M codes and CPT therapy codes for services provided on the same day.

Independent physical therapists cannot report the general CPT visit codes to Medicare.

Physicians may report general visit codes for services provided the same day as CPT therapy codes only if they provide separately identifiable services that meet the definition of a visit.

There will be no difference in Medicare payment amounts made to physicians and therapists when they bill the same code.

34. For a hospital inpatient stay that begins in December 1991 and ends in January 1992, which inpatient hospital codes should be used?

For the services before January 1, 1992, the old visit codes should be used. For the hospital visits on or after January 1, 1992, the new visit codes should be used.

35. If the new visit codes are used for services PRIOR to January 1, 1992, will Medicare pay for them?

No. The Medicare fee schedule and the new visit codes are effective for services on or after January 1, 1992.

36. In a hospital inpatient situation involving one physician covering for another, if physician A sees the patient in the morning and physician B, who is covering for A, sees the same patient in the evening, will Medicare pay physician B for the second visit?

No. The hospital visit descriptors include the phrase "per day" meaning care for the day. If physician B covers for physician A, Medicare will not pay for the services of physician B.

37. When is a patient a "new patient"? How does the 3-year requirement for a new patient apply to members of groups?

The 1992 CPT defines a new patient as one who has

not received any professional services from the physician within the past 3 years.

For Medicare payment purposes, HCFA interprets the term "physician" to include all physicians practicing in the same group and billing with the same billing number regardless of specialty. If any member of a group has seen the patient and billed a visit or consultation within 3 years, the patient is considered "established." However, if only services other than visits or consultations were received within 3 years (e.g., anesthesiology, pathology), the patient is considered "new."

38. Will Medicare pay for a consultation if one physician in a group practice requests a consultation from another physician in the same practice?

Yes. As long as the Medicare requirements for a consultation are met, Medicare will pay for a consultation from another physician in the same group. The consultation must be requested by the attending physician; the consultant must obtain a history and examine the patient; and a written report of findings must be furnished to the attending physician.

39. Will emergency department physicians (who have limited knowledge of a patient's medical history) be required to use the new modifiers for services within the global surgery period in order to be paid?

The new modifiers are:

Modifier "-79"—unrelated procedure by the same physician during a postoperative period;

Modifier "-24"—unrelated evaluation and management service by the same physician during a postoperative period.

The emergency department physician would not use a modifier unless the emergency department physician happened to be the operating surgeon. These modifiers are intended for use by the operating surgeon only.

40. If Dr. Smith transfers a patient from hospital A to hospital B for treatment, will Medicare pay Dr. Smith for both the hospital discharge day management services at hospital A and hospital admission at hospital B?

Yes. Medicare will pay for the hospital discharge day management services at hospital A and the hospital admission services at hospital B. Generally, Dr. Smith's hospital admission services at hospital B would be at a low level because much of the work normally associated with the admission had already been performed by him in hospital A.

41. For new physicians, are the emergency department evaluation and management codes (99281-99285) considered primary care codes and therefore not subject to new physician reduction rules?

Yes. The emergency department codes are considered primary care codes and these codes are not subject to the new physician reduction rules. Other services performed in the emergency department are subject to the reduction.

BOOK REVIEW BOOK REVIEW BOOK

The 14 Day Stress Cure. Mort Orman, M.D.
Houston: Breakthru Publishers. 1991. 323 pages.
\$22.95 hardcover. \$13.95 softcover.

Discussions of methods to deal with stress have been appearing for over thirty years. In the new book by internist Mort Orman, he has described a fascinating new approach to life and stress. He has not taken or modified the prior approaches to stress management techniques but has created what he calls the ultimate approach.

The book begins with Dr. Orman describing why prior methods have not been appropriate or effective long-term and his purpose in writing the book. He believes that with his ultimate approach you can "improve your health, enhance the quality of interpersonal relationships, increase your productivity, raise your confidence and self-esteem and become more successful in other areas of your life." He then provides some validation of this approach by relating how his own life improved.

The book is organized into fourteen chapters, each chapter representing one day in the fourteen-day cure. Each chapter begins with a discussion of a particular aspect of stress or technique in the approach and at the end of each chapter are daily exercises to help reinforce the ideas presented.

The premise of the book is presented in chapter 1 using biolinguistics, a viewpoint that focuses on the role of language in human stress. Dr. Orman described how "stress is just a word." With this concept, stress itself does not exist, there is no good or healthy stress, stress is not caused by external forces, and there is a better way to deal with stress than "managing it."

In chapters 4-13, the book informs you of the step-by-step approach for coping with stress, provides further explanation of each step, and provides examples of how any stress can be handled by this approach. In the final chapter, ways to overcome common obstacles to fully using this approach are discussed.

This book provides a very healthy and positive approach to life and, therefore, stress. Individuals who are motivated and psychologically stable might well benefit from this approach. It is not intended to replace diets, exercising, medications, or psychotherapy. This is clearly stated by the publishers at the beginning of the book.

The problem with this book and all books about ways to deal with life, is that they are based primarily on the author's own life experiences and anecdotal reports of success. And while these may be valid observations, we have no data that this approach really alters peoples lives and accomplishes the goals set forth initially. While randomized trials would be difficult; the anecdotal successes may represent an individual who was ready to approach life differently regardless of the techniques used.

The book is an interesting, reasonable, and healthy approach to stress. Some physicians and patients could appreciate and benefit from reading it. It would be most interesting if objective data could be collected to validate the use of this approach.

Annual Meetings

mini-invasion & MEGATREATMENTS

Featuring: Thomas R. Reardon
M.D. AMA Trustee

Presidential Banquet : May 2, 1992
Honoring J. David Nagel, M.D.

Thursday, Friday and Saturday
April 30, May 1, and
May 2, 1992

Meeting Overview

Thursday, April 30, 1992

8:00 a.m. – 5:00 p.m. – Registration
8:30 a.m. – Council Meeting
9:30 a.m. – House of Delegates Meeting/General
Membership Meeting featuring:
Special Guest Speaker
Ron Shapiro, Esq.
9:30 a.m. – Spouse Program
11:00 a.m. – 4:00 p.m. – Auxiliary 43rd Annual Meeting
11:30 – Scientific Session
12:00 noon – 12:30 p.m. – Break – *Visit the Exhibits* –
12:30 p.m. – 1:30 p.m. – Lunch on your own
1:30 p.m. – 2:30 p.m. – Plenary Session
"Health Care Reform"
AMA Trustee Thomas R. Reardon, M.D.
2:30 p.m. – 3:00 p.m. – Break – *Visit the Exhibits* –
Exhibitor Sweepstakes Drawing
3:00 p.m. – 6:00 p.m. – Scientific Sessions
4:15 p.m. – Workshop
*"Avoiding Excess Retirement and Estate Taxes:
Strategies for the 90s"*
Med Chi Agency
6:00 p.m. – 9:30 p.m. – Harbor Cruise aboard the
Lady Baltimore
(Advance registration required – space is limited)

Friday, May 1, 1992

7:00 a.m. – Prayer Breakfast
8:00 a.m. – 5:00 p.m. – Registration

8:30 a.m. – Workshop

"Accreditation for Continuing Medical Education"

10:30 a.m. – Break – *Visit the Exhibits* –

Exhibitor Sweepstakes Drawing

12:00 noon – Auxiliary Meeting and Auction

12:30 p.m. – 1:30 p.m. – Lunch on your own

1:30 p.m. – Mini-Symposium

"Physician Office Labs: Master or Slave?"

4:00 p.m. – Workshop

"Computers in the Medical Office"

7:35 p.m. – Baltimore Orioles vs. Seattle Mariners

at the new Oriole Park at Camden Yards

(Reservations required – space is limited)

Saturday, May 2, 1992

8:00 a.m. – 12:00 noon – Registration

8:30 a.m. – Mini-Symposium

"Ethics of Dying"

8:30 a.m. – 1:00 p.m. – Scientific Sessions

Inpatient Treatment For Dissociative Disorders

Under the direction of Dr. Richard J. Loewenstein, Sheppard Pratt's treatment program is based on the view that dissociative disorders are readily diagnosed and treated. Utilizing the Armstrong-Loewenstein Dissociative Disorders Assessment Protocol as a baseline, individual treatment planning is determined and the master treatment plan can include:

- intensive therapy specifically designed for people with histories of trauma and abuse;
- psychopharmacology;
- cognitive therapy;
- adjunctive hypnotherapy;
- stress management;
- managed milieu that teaches safe coping skills for symptoms such as: switching, dissociation, amnesia, and flashbacks;
- and a full range of expressive therapies.
- The staff of the DDU also provides education and therapy for the patient's present day family with assessments available for children.

Sheppard Pratt's DDU is available to adult patients with dissociative disorders or other chronic childhood onset, post-traumatic conditions who are:

- newly diagnosed and are unstable or;
- in acute crisis or are decompensating or;
- involved in working through difficult therapy material requiring a safe, secure setting or;
- dangerous to self or others and/or self mutilatory.

For more information or to make a referral, call: Dr. Susan Wait, coordinator for the inpatient DDU at (410) 938-5070.

YOCON[®]

YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalamic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon[®] is indicated as a sympatholytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.^{1,2} Also dizziness, headache, skin flushing reported when used orally.^{1,3}

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.^{1,3,4} 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to 1/2 tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.³

How Supplied: Oral tablets of Yocon[®] 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

"Keeping You In Touch With Your Patients"

8713 Greenbelt Rd. Suite 302, Greenbelt, MD 20770

Jose M. Yosuico, M.D.

1992–1993 Med Chi President

Betsy Newman

Ms. Newman is director of public relations, Medical and Chirurgical Faculty of Maryland.

"Med Chi is a great organization," says Dr. Yosuico. "Whatever I try to do during my year as president, I'm going to give one hundred percent. I'm a team player. That's my style."

Walking through the halls of Church Hospital with Jose M. Yosuico, M.D. is like strolling down Main Street, USA with a very popular mayor. He knows everyone and everyone knows him. Amidst all the smiles, waves, and "how are you's," it's clear why Dr. Yosuico has been affiliated with Church Home and Hospital for over thirty-five years—he likes the people. As president of Med Chi for 1992–1993, Dr. Yosuico hopes to use his friendly, personal style to embark on a new campaign—a campaign to encourage more physicians to join organized medicine and become part of the team.

Membership

"Increasing membership will be one of my main priorities as Med Chi president," says Dr. Yosuico. As chairperson of the Baltimore City Medical Society's (BCMS) membership committee in 1991, Dr. Yosuico succeeded in increasing the membership by seventy-six members. His method was simple—he asked every member physician in Baltimore City to get one nonmember to join. To help with this endeavor, he contacted member physicians in every hospital in Baltimore City and asked them to serve as recruitment leaders for their hospital. Dr. Yosuico would often meet personally with nonmember physicians interested in joining the society. As a result of his outstanding efforts, Dr. Yosuico has received the BCMS "Recruiter of the Year Award" for 1988, 1989, and 1990. As the current chairperson of the BCMS membership committee, Dr. Yosuico still keeps in contact with his hospital leaders and often talks one-on-one with nonmember physicians about the benefits of organized medicine.

During his term as Med Chi president, Dr. Yosuico intends to modify the membership recruitment model he used in Baltimore. Instead of hospital leaders, however, Dr. Yosuico will rely on Med Chi's twenty-six component societies to be the leaders in increasing membership.

"Component societies are Med Chi's backbone," says Dr. Yosuico. "Med Chi can assist the component societies in increasing their membership, but it is the component societies that really attract new members."

Dr. Yosiuco confers with Med Chi Executive Director Angelo J. Troisi, F.A.C.H.E.

Dr. Yosiuco hopes component societies will adopt his "member-get-a-member" philosophy and plans to evaluate ways that Med Chi can aid its component societies in their membership efforts. For example, he was instrumental in getting a pilot project off the ground whereby component societies would keep fifty percent of a new member's first year dues in order to offset the costs of membership recruitment.

Dr. Yosiuco believes one way Med Chi can help component societies gain and keep new members is through member services. "We have to keep physicians informed of our accomplishments. We've got to remind them of what we've done for them in the past and what we're doing for them today."

Med Chi in Annapolis

"Med Chi is the spokesperson for Maryland physicians," explains Dr. Yosiuco. "We need to tell physicians about what we do for them in Annapolis." Dr. Yosiuco describes how Med Chi has helped to defeat measures that would initiate mandated Medicare assignment and triplicate prescriptions. Med Chi has also helped initiate tort reform and has supported legislation that benefits the public health, such as laws that restrict smoking in public places. During the 1992 session of the Maryland General Assembly, Med Chi represented the voice of Maryland physicians on a myriad of issues ranging from acupuncture to x-ray technologists. Legislation dealing with AIDS (acquired immunodeficiency syndrome) was especially prevalent during the 1992 session, with Med Chi representatives testifying on over twenty bills dealing with different aspects of AIDS and HIV (human immunodeficiency virus). Several bills were introduced that would have required mandatory HIV testing for health care workers. "There is no scientific evidence to support the cost of mandatory HIV testing for physicians," says Dr. Yosiuco. "[To date,] there is no known case of a physician who has passed HIV to a patient." Dr. Yosiuco adds that mandatory testing

of doctors would be prohibitive. "We should spend our money to educate and treat rather than test."

The health care system and Health Access America

Another major issue that greatly concerns Dr. Yosiuco is the changing face of our health care system. During the 1992 Maryland General Assembly, several health care reform proposals were introduced. One bill would have implemented Universal Health Insurance, a single payer health care system that would replace Maryland's current health care system with one similar to the Canadian health care system that is financed and run by the government. Dr. Yosiuco, who does not favor extensive government regulation of medicine, is opposed to attempts to create a Canadian system of health care in this country. "I hope we don't have national

health insurance," says Dr. Yosiuco, who believes health care should be a cooperative combination of public and private resources.

"The AMA's [American Medical Association] Health Access America is a much better plan than Universal Health Insurance," says Dr. Yosiuco. Health Access America, which was developed in response to calls for a national health plan, attempts to address the weaknesses of our current medical system while preserving its strengths. Some other fundamental principles of Health Access America are

- providing affordable and appropriate health care coverage for all Americans, regardless of income;
- assuring continued access to affordable health care for the elderly;
- delivering health care at appropriate costs;
- allowing patients the freedom to choose their health care provider and the manner in which their health care benefits are delivered; and
- maintaining the highest ethical standards of medical care.

Recently, Med Chi received a grant from the AMA with the principal goal of educating Maryland physicians, the public, the media, and legislators about Health Access America as an alternative to any national health insurance proposal.

Health care costs

"It is true that the cost of health care keeps going up," says Dr. Yosiuco. "But it is also going up in other countries where you have to wait for health care...and the quality of care isn't as good." He maintains that physicians are the scapegoats for the debate surrounding our nation's health system. "They say that 11 percent of the GNP (gross national product) is health care. Health care is comprised of hospitals, pharmaceutical companies, nursing homes...all of which cost huge amounts of money when compared with the cost of a physician's care."

"The cost of health care has gone out of control, but it's not because of the physician alone. The doctor is one small factor. It is society," says Dr. Yosunico. He refers to a recent study in *JAMA* (September 18, 1991) that estimates that cocaine-addicted babies cost hospitals in excess of \$500 million dollars annually. "We have to take care of babies who are born addicted to drugs," he says. "Doctors don't deny people care. The job of the doctor is to take care of the patient...to make sure patients have a high quality of life...to make every patient physically and emotionally well."

Dr. Yosunico believes one reason physicians are accused of contributing to increasing health care costs is because of new and better technologies. He explains that the price for these new technologies is often very expensive. "When a doctor orders a test it is because the patient needs that particular test. Too often, the doctor is blamed because the needed test costs a lot of money. Tests and procedures are necessary in order for a physician to make the proper diagnosis. Doctors have to prescribe the right test in order to give the right medicine at the right time."

"But we shouldn't order tests because we want to avoid a liability suit," adds Dr. Yosunico. He maintains that physicians should follow strict ethical standards. Defensive medicine practices contribute to high medical costs, believes Dr. Yosunico. "Doctors should take care of their patients needs and not worry about being sued."

Professionalism

"Professionalism should be foremost for all physicians," he says and explains that professionalism should apply to all aspects of medical practice. He also states that physicians should be required to disclose any of their financial interests in a medical facility to patients. "Doctors should give patients the option to choose where they want to have their tests and procedures done. That's the ethical part of medicine...without it, medicine would be just like any other business."

The future of medicine

Whatever changes are imposed on our current medical system in the coming years, Dr. Yosunico insists that physicians need to be an integral part of the decision-making process. "Quality of care must not be compromised when cutting costs," he says.

Dr. Yosunico hopes Marylanders will accept the major components of the Health Access America plan. "There are more than 30 million people in this country who are not covered by health insurance," says Dr. Yosunico. "We need to do something about it. I just hope this country doesn't resort to national health insurance." Dr. Yosunico hopes physicians will educate their patients about the drawbacks of a universal or government-run health care system.

The future of Med Chi

Increased communication with members is essential to keeping members informed about critical issues surrounding the future of our health care system, maintains Dr. Yosunico. In addition to his strategy for the membership, he plans to continue holding regional conferences around the state during the next year. Initiated in 1989 by Past President Michael R. Dobridge, M.D., the regional conferences were created to help update physicians living in the southern, western, and eastern regions of Maryland about important Med Chi issues. Regional meetings also enable Med Chi's president to address

"Med Chi has an excellent staff," says Dr. Yosunico, seated here with Med Chi Deputy Executive Director Carmine Valente, Ph.D. (l) and Med Chi Director of Finance Joseph J. Harrison (r).

local concerns. "Med Chi is constantly searching for new ways to help its members," says Dr. Yosunico.

"I know that more and more physicians will see the advantages of belonging to Med Chi," he adds, as he expresses his hope that he can encourage younger physicians to join Med Chi. "We need younger physicians to be involved at the leadership level," he says. "The sooner they get involved, the more active they will become and be able to participate at the leadership level."

"Med Chi also has an excellent staff," says Dr. Yosunico. "Most physicians have no idea how much staff actually do for the faculty's members. People like Angelo Troisi, Joe Harrison, Carmine Valente, Rose Matriccioni, and the rest of the staff really do a great job. As physician members, we have to do our best to retain all the good people who do so much for Med Chi."

"Med Chi is a great organization," says Dr. Yosunico.

"Whatever I try to do during my year as president, I'm going to give one hundred percent. I'm a team player. That's my style." ■

Jose M. Yosuico, M.D.

Jose M. Yosuico, M.D. still makes house calls. He has made house calls for over thirty-five years and vows that he will continue to make house calls for all his patients who are too ill or too old to make the trip to his Church Hospital office. Dr. Yosuico adds that many of the people he visits have been his patients for more than thirty years.

"I didn't always want to be a doctor," admits Dr. Yosuico. "I wanted to be a priest." Dr. Yosuico grew up attending a Catholic school in Manila, the capital of the Philippine Islands. He had a great admiration for the priesthood. His plans changed, however, during the Japanese invasion when he had an appendectomy with only local anesthesia. He was 14 years old. "I stayed in the hospital for more than a month," he says. "I saw doctors every day. I saw how the patients felt about their doctors and I said to myself, 'That's what I want to be.'"

In 1953, he graduated from the University of the Philippines College of Medicine in Manila and was accepted into a postgraduate training program at South Baltimore General Hospital. After completing a rotating internship there in 1954, Dr. Yosuico fulfilled his residency requirements in internal medicine at Church Home and Hospital from 1954 to 1957. "I chose South Baltimore General because it sounded like Philippine General," he admits. "I went to Church Hospital because I eventually wanted to go to Johns Hopkins."

But Dr. Yosuico never went to Hopkins. After finishing his year as chief resident at Church, he went into private practice in Laurel, but still sent his patients to Church. In 1957, he entered into private practice at Church and has never left. "I love this hospital," he confesses. Although Dr. Yosuico still holds privileges at Harbor Hospital Center (formerly South Baltimore General), he sees all of his patients at Church.

During his more than thirty-five-year affiliation with Church, Dr. Yosuico has been involved in almost every major committee of the hospital. He served as the hospital's chief of staff from 1981 to 1985. During that period he also served as chairperson of the Medical Execu-

Dr. Yosuico's family at the wedding of his daughter Lisa. From left to right—James Stahl, Theresa Stahl, Jennifer Sellner, John Sellner, Alexandra Sellner, Virginia Sellner, Jose M. Yosuico, M.D., Lisa Love, Andrew Love, Dorothy Yosuico, Joshua Yosuico, Michelle Yosuico, Megan Yosuico, Raymand Yosuico, and Mary Pat Yosuico.

tive Committee and was a member of the board of directors and the board of trustees. From 1985 to 1991, he served as chief of the Department of Emergency and Community Medicine. At present, he is on the board of the Church Home and Hospital Health Centers, and is chairperson of the Medical Advisory Committee and the Utilization Review Committee.

In addition to his extensive involvement with Church Hospital, Dr. Yosuico was physician-in-charge at the Maryland House of Correction from 1958 to 1976. He also served as an associate in medicine at the Maryland School of Medicine from 1962 to 1976.

Dr. Yosuico has long been an active participant in organized medicine. A member of the American Medical Association and the American Medical Association Political Action Committee since 1957, Dr.

Yosuico became active on the state level in 1978 when he served as chairperson for Med Chi's Physician/Patient

Dr. Yosuico's two youngest grandchildren, Sarah and Benjamin Stahl.

Relations Committee. In 1980, he was elected to the Med Chi House of Delegates. Four years later, he was elected as treasurer for the faculty and subsequently became chairperson of Med Chi's Finance Committee.

In 1981, Dr. Yosuiico became a member of the Board of Directors to the Baltimore City Medical Society (BCMS). Following his appointment to the Baltimore City Political Action Committee Board of Directors, Dr. Yosuiico was elected vice president of BCMS. He became president of BCMS in 1987.

Before he was chosen as president-elect of Med Chi in 1991, Dr. Yosuiico served as a member of the board of directors for the Baltimore City Medical Foundation; the Medical Service Corporation for BCMS; the Center for Health Education, Inc.; and Comprehensive Health Associates, P.A. Dr. Yosuiico will assume the office of Med Chi president during the House of Delegates meeting on May 2, 1992.

Dr. Yosuiico has received numerous awards in recognition of his many activities. He received a governor's citation for his work as commissioner for the Governor's Commission on Black and Minority Health from 1986 to 1988. He received a second governor's citation in 1990. In addition to being the recipient of the Distinguished Alumnus Award from the University of the Philippines Medical Alumni Association of America, Baltimore Chapter, he holds several resolutions and certificates of appreciation.

Outside of his medical activities, Dr. Yosuiico is a founding member of several Filipino societies including the Filipino Society of Baltimore-Katipunan, the Association of Philippine Physicians of Maryland, and the University of the Philippines Medical Alumni Association of America, Baltimore Chapter. He is a member of the Association of Philippine Physicians of America, the Maryland Classified Employees Association, the National Rifle Association, the Jessup Rod and Gun Club, and the Optimist Club of Laurel, Maryland. Dr. Yosuiico is an avid gun collector and outdoorsman.

Dr. Yosuiico currently lives in Ellicott City with his wife, Dorothy. They have five children—Virginia, Raymond, Mary Pat, Theresa, and Lisa; and six grandchildren—Jennifer, Alexandra, Megan, Joshua, Sarah, and Benjamin. ■

Lyme disease in Maryland: 1987–1990

Clifford S. Mitchell, S.M., M.D., M.P.H.; Marianne Cloeren, M.D., M.P.H.; Ebenezer Israel, M.D., M.P.H.; Christina Lazar, M.D.; and Brian S. Schwartz, M.D., M.S.

We describe the epidemiology of Lyme disease in Maryland for 1987 to 1990 when the number of cases reported grew from 23 to 448 and the number of cases meeting the CDC case definition grew from 23 to 238, as well as discuss the implications of increased reporting and diagnosis of Lyme disease.

From the Department of Environmental Health Sciences, Division of Occupational Health, Johns Hopkins University School of Hygiene and Public Health, where Drs. Mitchell, Cloeren, and Schwartz are internists and Dr. Lazar is a public health specialist, and from the Maryland Department of Health and Mental Hygiene, Epidemiology and Disease Control Program, where Dr. Israel is director.

Reprints: Brian S. Schwartz, M.D., Division of Occupational Health, Johns Hopkins University School of Hygiene and Public Health, 615 North Wolfe Street, Baltimore, MD 21205.

Lyme disease has become an increasingly important public health threat in the United States since it was first reported in this country in 1975 in Lyme, Connecticut. It is caused by a spirochete, *Borrelia burgdorferi*, and transmitted by infected ticks, most commonly of the species *Ixodes dammini*.¹ The disease usually begins with a spreading annular rash, erythema migrans (EM), that starts at the site of the bite and usually exhibits central clearing; the rash may occur from a few days to a few weeks after the bite. Flu-like symptoms including myalgia, headaches, and fever are often present at this stage. If the patient is treated with appropriate antibiotic therapy early in the disease, the patient is usually cured. If early symptoms do not occur or are unrecognized, late complications may occur from weeks to months after the bite; these complications include polyarthrititis, damage to the cardiac conduction system, and neurologic deficits. The late complications are variably responsive to antibiotic therapy and may result in permanent deficits; however, the majority of patients can be cured at all stages of the disease.²

Prior to 1989, Lyme disease was not reportable in Maryland. From 1984 to 1986, the number of cases reported in Maryland was relatively small: 10 in 1984, 20 in 1985, and 15 in 1986.³ In this report, we describe the epidemiology of Lyme disease in Maryland from 1987 to 1990.

Methods

All reports of Lyme disease reported from January 1, 1987 to December 31, 1990 by physicians, hospitals, and out-of-state laboratories to the Maryland Department of Health and Mental Hygiene (DHMH) were investigated. The number of Lyme serologic tests performed by the state

health department laboratories precluded full investigation of all of these, but attempts were made to contact, for follow-up information, the physicians who ordered the tests. All reporting physicians were requested to complete detailed Lyme disease surveillance forms; those physicians who did not return the forms were, in most cases, contacted by DHMH staff, and the surveillance forms were filled out with information provided by the physician by telephone. The surveillance forms used were those provided by the Centers for

Disease Control (CDC); although new forms were adopted by CDC and DHMH in mid-1990, most of the information requested remained the same. Information requested included age, gender, race, tick bite information when available, serologic results, and symptomatology.

For this study, CDC criteria were used to define a case: EM or at least one late manifestation with laboratory confirmation of infection.⁴ EM alone was sufficient to make the diagnosis, although the CDC amendment to include only cases where the lesion measured at least 5 centimeters was not implemented until September of 1990. Late manifestations included any one of the symptoms shown in Table 1 when there was no other disease or condition identified.

Laboratory confirmation, according to the CDC, is established when diagnostic levels of anti-*B. burgdorferi* anti-

Figure 1. Lyme disease cases reported and confirmed in Maryland, 1987-1990

bodies are detected in serum or cerebrospinal fluid (CSF) by immunofluorescence assay (IFA) or enzyme-linked immunosorbent assay (ELISA), when the spirochete itself is isolated from tissue or body fluid, or when a significant change in antibody levels is detected in paired acute and convalescent sera.

A test was considered positive if it met any of the following criteria:

1. A physician reported a positive result, without providing additional information;
2. There was an IFA result of 1:256 or higher;
3. There was an ELISA result 10 percent greater or more than the lab normal, when the normal was provided;
4. There was an ELISA result greater than 1.10, when no lab normal was provided (since in most area laboratories, including the heavily utilized DHMH lab, the normal result is <1.0, often <0.8);
5. There was a change of at least 20 percent between acute and convalescent serologic results (either an increase or a decrease was considered positive, since it has been shown that a positive titer may decrease with appropriate antibiotic therapy); or
6. There was a biopsy or culture from patient tissue or body fluid positive for the spirochete.

Laboratory findings alone were not considered sufficient criteria for case definition, but were used in conjunction with the above clinical criteria.

Differences in proportions were tested using chi-square tests.

Results

The number of cases of confirmed Lyme disease in the state was 23 in 1987, 56 in 1988, 138 in 1989, and 238 in 1990, for a total of 455 confirmed cases. Reporting of the disease also increased dramatically, from only 23 cases (all subsequently confirmed) reported to the state in 1987, to 448

Table 1. Late manifestations of Lyme disease: Criteria for inclusion⁴

Musculoskeletal system

Recurrent arthritis (mono or polyarticular)

Nervous system

Lymphocytic meningitis

Cranial neuritis (particularly facial palsy)

Radiculoneuropathy

Encephalomyelitis**

Cardiovascular system

Acute onset of transient high-grade atrioventricular conduction defects, which may be associated with myocarditis (palpitations, bradycardia, bundle branch block, or myocarditis alone are not sufficient criteria).

*To be considered a case, the patient must have had at least one of the above without any other explanation for the condition, and laboratory evidence of Lyme disease as noted in the text.

**Requires laboratory confirmation of anti-*B. burgdorferi* antibodies in the CSF, with a higher titer in the CSF than in the serum (headache, fatigue, paresthesia, or stiff neck are not sufficient criteria).

Figure 2. Age and sex distribution of Lyme disease in Maryland, 1988–1990.

reported cases in 1990 (Figure 1). Of the 448 cases reported in 1990, 40 were determined not to have Lyme disease, 138 were considered unconfirmed cases that did not meet the CDC criteria and were not included in the subsequent analysis, and 238 met the case definition. The remainder were cases with onset in previous years, or were patients visiting from another state.

Demographics. Ages of reported cases ranged from less than a year to 89 years. The median age was 31; the mean age was 33 (± 22.0). By ten-year intervals, the number of cases was 99 (0–9 years), 48 (10–19), 66 (20–29), 78 (30–39), 45 (40–49), 46 (50–59), and 72 (60 years and older). There were 225 males (49.6 percent) and 229 females (50.4 percent) among the cases (the gender of one case was not reported). Excluding the 23 cases from 1987, for which there were only limited data available, the sex ratio among different age groups was not statistically different (Figure 2).

Information on race was available in most cases for the years 1988–1990. Of 417 cases for which racial data were available, 387 (92.8 percent) were white, 22 (5.3 percent) were African-American, 6 (1.4 percent) were of Asian descent, and 2 (0.5 percent) were Native American.

Geographic distribution. Based on a 1990 population of 4.78 million, the statewide rate of Lyme disease per 100,000 was 0.48 in 1987, 1.17 in 1988, 2.89 in 1989, and 4.98 in 1990. All but one Maryland county (Garrett) reported cases of Lyme disease during at least one of the four years (Table 2). The counties with the highest average rates over the four years were Kent (30.83), Queen Anne's (20.62), Charles (10.13), and Cecil (9.11). The 1990 rates across Maryland (calculated for those counties with 5 or more cases) ranged from 1.1 to 56 per 100,000.

Tick exposure. Information on recent tick bites was recorded through most of 1990 (newer surveillance forms

requested only location of tick bites, not whether they had occurred). Definite tick bites were reported in 192 of the 436 cases (44.0 percent) where tick bite status was recorded.

For 1988–1990 cases, adults (46.6 percent) were more likely than children (31.3 percent) to have remembered or reported a tick bite ($\chi^2 = 8.89$, $p = 0.003$). Women (38.2 percent) reported bites less often than men (45.5 percent) but the difference was not statistically significant ($\chi^2 = 2.33$, $p = 0.10$). Patients with EM were more likely to have remem-

bered a tick bite (48.4 percent) than those without EM (20.6 percent; $\chi^2 = 24.9$, $p = 0.0001$).

Month of onset. Date of onset of symptoms (or first visit to a medical practitioner) was reported for 448 of the 455 cases. The peak onset occurred in June with 123 cases (27.0

*Annual rate based on 1990 Maryland population estimates, US Bureau of the Census, US Department of Commerce.

**Other includes 2 cases with no county identified.

Figure 3. Monthly distribution of Lyme disease cases in Maryland, 1987–1990.

percent); the four-month period from May through August had 355 (78.0 percent) of the cases (Figure 3). For those reports in which both a date of onset and a date of a probable tick bite were recorded (169 cases), the duration between tick bite and symptoms varied between 0 and 1,045 days (excluding a small number of cases in which onset was reported prior to a tick bite). The mean duration between tick bite and onset of symptoms was 29.1 days (29.7 ± 64.5 for females, with a median of 10.0 days; 28.7 ± 113.9 for males, with a median of 7.0 days).

Symptoms. EM was the most common symptom, occurring in 342 (75.5 percent) of the 453 cases for whom this information was recorded. From 1988 to 1990, a rash of some

type (sometimes specified as EM by the physician) was recorded as the patient's chief complaint in 259 of 413 (62.7 percent) cases with recorded chief complaints. EM was more likely in men (81.4 percent) than women (71.2 percent; $\chi^2 = 6.15$, $p = 0.01$) and in whites (78.0 percent) than in non-whites (58.3 percent; $\chi^2 = 7.10$, $p = 0.008$). There was no significant difference between the proportion of EM reported in adults (76.8 percent) and in children (75.4 percent).

Chief complaints were recorded in 413 of 432 cases in 1988–1990 (data were not available for 1987). Diffuse systemic symptoms oc-

curred frequently, but symptoms related to late sequelae of the disease were uncommon. There was considerable variability in the description and detail of presenting symptoms. For example, EM, ECM, target lesion, and rash were all common descriptors. Table 3 lists presenting symptoms in decreasing frequency. After EM, the most common symptoms reported were arthralgias or arthritis, fever, headache, and fatigue/malaise/myalgias. These combined symptoms accounted for approximately 90 percent of the symptoms recorded at presentation to a physician.

Complications. Arthritis was the most frequent complication, occurring in 126 of 455 cases (27.7 percent). For 1988–1990 cases, women were more likely to have arthritic complications (32.5 percent versus 20.0 percent for men, $\chi^2 = 8.80$, $p = 0.003$). Children developed arthritis less often (22.4 percent) than adults (27.9 percent), but the difference was not significant.

There were 61 cases with neurologic complications (13.4 percent). For 1988–90, there were 19 cases of Bell's palsy (4.3 percent), 9 cases of meningitis (2.1 percent), and 6 cases of carpal tunnel syndrome (1.4 percent). There were no differences in neurologic complications by gender. Neurologic complications in general were more likely in patients without EM (33.3 percent) than with (7.2 percent); Bell's palsy in particular was more likely in patients without EM (13.7 percent) than with EM (1.5 percent). Other symptoms rarely reported included visual disturbance, migraine headache, discrete peripheral neuropathy other than carpal tunnel syndrome, and optic nerve edema.

Cardiac symptoms were reported in 12 of 455 cases (2.6 percent). The abnormalities noted included unspecified electrocardiogram (EKG) abnormalities in 4 cases and palpita-

Table 3. Presenting symptoms among 413 Lyme disease patients as recorded by physicians, 1988–90.

Symptom	Number of cases*	Percent

Palpitations/tachycardia	2	0.4
Carpal tunnel syndrome	1	0.2
TOTAL	530	100.0

*Does not total to number of cases because of multiple chief complaints for a single patient.

tions in 7 cases. There was one case of documented tachycardia among those with palpitations. None of these patients were reported to have cardiac conduction abnormalities. Among the 1988–1990 cases with cardiac complications, there were 4 females (1.9 percent) and 8 males (3.6 percent), with 10 cases among adults (3.4 percent) and 2 among children (1.5 percent); neither difference was statistically significant.

Many of the cases had multiple organ system involvement, with a combination of cardiac, neurologic, and rheumatologic symptoms coexisting. For 1988–1990 patients, hospitalization was required in 56 of 407 cases with responses recorded.

Diagnostic confirmation. Serologic testing results are presented only for 1990 data, because follow-up on these results was more complete. Serologic testing was performed in 198 of 237 patients for whom this response was recorded; of these, 13 had no results reported. Since only patients with EM could be considered cases without serologic confirmation for the purposes of surveillance, all those without tests were patients with EM.

Of 185 cases for whom acute serologic test results were available, 117 (63.2 percent) were positive. Relatively few patients had convalescent testing, but of the 66 with convalescent results, 46 (69.6 percent) were positive. Of the 117 acute tests which were positive, there are convalescent results for 38; 6 of these (15 percent) were negative. Of the 68 cases with negative acute serologic results, only 28 had serology repeated; half of these turned positive.

Cultures were done and reported infrequently. There were no cultures reported in 1988, two in 1989 (neither positive), and 7 in 1990 (of which 3 were positive).

Discussion

The epidemiology of Lyme disease in Maryland during the years 1987–1990 has altered since an earlier report described cases occurring from 1984 to 1986.³ The number of cases per year has increased each year, from 10, 20, and 15 cases in 1984, 1985, and 1986, respectively, to 23, 56, 138, and 238 cases per year in 1987, 1988, 1989, and 1990, respectively (a thirteen-fold increase). This pattern is consistent with the sixteen-fold increase in Lyme disease seen nationally, from 497 cases in 1982 to 7,997 cases in 1990.⁵ Since Lyme disease became reportable in 1989, the total number of cases reported has increased, while the percentage of cases that are confirmed has decreased.

The demographics of the disease are similar to that reported previously, although with some important differences. From 1984 to 1986, the male to female ratio of cases was 3:1; from 1987 to 1990, the sex ratio was approximately equal, although there were gender differences in some symptoms (EM) and complications (arthritis/arthralgias). The proportion of adults has increased since the previous study, with a median age of 31 years, compared with 15.5 years previously. The difference may be due to increasing recognition or reporting of Lyme disease among physicians treating adults. Most

patients (92.8 percent) were white, although whites make up only 69.9 percent of Maryland residents (1990 estimate, US Bureau of the Census, US Department of Commerce). Only 5.3 percent of cases were African-American, although African-Americans make up 24.8 percent of Maryland's population. Some of this difference is probably due, in part, to the different geographic distribution of African-American and white Maryland residents; African-Americans are more likely to live in and around Baltimore and in Prince George's County, areas which had low rates of Lyme disease. Rates of Lyme disease were highest in Kent, Queen Anne's, Charles, Cecil, and Calvert counties. This is similar to previous years. The highest rates were found in rural areas, as expected. Three of the five counties with the highest rates are on the Eastern Shore of Maryland. It is difficult to explain the disproportionately high rates in some of these counties in comparison to adjacent counties (especially the Kent County rate), but differences in reporting or diagnosis, or in statistical artifact may account for these observations. Western Maryland (Garrett, Allegany, and Washington counties) had few cases. Charles and Calvert counties had higher rates than neighboring St. Mary's and Prince George's counties, although in the case of Prince George's County the lower rate may be due to the county's heavy urbanization near Washington, DC. Along the northern border of the state, the rate of Lyme disease decreased with increasing distance from the Eastern Shore (Cecil County, 9.11; Harford, 4.26; Baltimore, 1.95; and Carroll, 1.62). Frederick County, in north central Maryland, also had a low rate of Lyme disease over the four years (1.17), but is currently experiencing an increase in its deer population.

Onset of the disease followed the same pattern as in previous years, with the majority of cases occurring in the summer months, peaking in June and July. Few cases had onset before May or after August. This is expected, since the tick is most active in the summer, when people are more likely to be outdoors with exposed skin.

Fewer than half of all patients recalled a specific tick bite. The spread of Lyme disease has been correlated in other states with increases in tick populations,⁶ but recollection of a tick bite in this study is probably a poor marker of actual tick exposure because of the low number of tick bites reported. Recall of tick bite was more common in patients presenting with EM than in those without EM. EM was present in 75.5 percent of patients, which is similar to previous years. The most common late complication noted was arthritis, which is consistent with other studies.²

Serologic results were similar to those in the previous study, with 63.2 percent positive during the acute phase. This result is consistent with the observation that antibody response often follows the initial EM phase. It would have been useful to compare initial negative results with convalescent results, but these were available in few cases. Of the 38 cases in which an initial positive result was followed by a convalescent test, 6 (15.8 percent) turned negative. Although the

serologic results must be interpreted with caution, given the differences among labs and reporting styles, as well as the known poor reliability of these tests, both within and between laboratories,⁷ this disparity between acute and convalescent results is not unexpected, since it has been shown that positive Lyme titers may decline with appropriate antibiotic treatment.

Laboratory confirmation was complicated by the variety of diagnostic methods and laboratories involved, by incomplete reporting of results (normal values for the laboratory and test were omitted more often than not), and by a change in the way the information was requested on the surveillance forms part way through 1990 (the later CDC forms requested a report of positive or negative from the reporting physician, while the forms used earlier requested the test values).

The factors responsible for the increased number of cases of Lyme disease include increased recognition of the disease by the public and physicians, increased reporting by health professionals, and an increased incidence rate. The latter may be due, in part, to an increasing deer population in the north-eastern US, including Maryland. Until residents in endemic areas learn to protect themselves with appropriate outdoor preventive habits, the next line of defense against Lyme disease is early recognition and treatment. As physicians become more familiar with the disease and with the Maryland reporting requirement, reporting should also increase. It is hoped that analysis of surveillance data provided by

physicians in the coming years will provide information useful for the prevention and treatment of Lyme disease, as well as improvement in the precision of diagnosis.

PHYSICIAN'S RECOGNITION AWARD

During February 1992, the physicians listed below received the American Medical Association's (AMA's) Physician's Recognition Award. Established in 1968, the Award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

The clinical use of histamine-2 receptor antagonists

Robert J. Michocki, Pharm.D. and James P. Richardson, M.D.

From the University of Maryland Medical System where Dr. Michocki is associate professor, School of Pharmacy, and clinical associate professor, School of Medicine; and Dr. Richardson is assistant professor, Division of Geriatrics, Department of Family Medicine.

Histamine-2 receptor antagonists have been available for fifteen years for the treatment of peptic ulcer disease and related disorders. While very safe, clinicians need to know correct dosing guidelines, drug interactions, and side effect profiles. Long-term therapy should be reserved for patients at high risk of recurrence.

The introduction of cimetidine in 1977 revolutionized the therapeutic management of peptic ulcer disease. Prior to the availability of histamine-2 (H_2) blocking drugs, traditional methods of managing peptic ulcer disease included antacids every two hours alternating with milk; bland diets; bed rest; anticholinergics; and avoidance of coffee and tobacco products. Patients eventually improved but at the expense of constipation or diarrhea, depending on the antacid chosen. During that time, a significant loss of economic productivity also occurred as a result of prolonged hospitalizations. Today, a variety of new therapeutic modalities are available for the management of peptic ulcer disease. These include several H_2 receptor antagonists, sucralfate (Carafate), omeprazole (Prilosec), anticholinergics, and antibiotics, as well as traditional antacids, which now have greater acid neutralizing capacities and enhanced palatability.

Following the introduction of H_2 blocking drugs, hospitalizations for peptic ulcer disease (PUD) and deaths from PUD have declined.¹⁻⁴ Of all the available therapeutic modalities, H_2 receptor antagonists are by far the most frequently prescribed drugs for the treatment of acid peptic disorders. Ranitidine was the third most frequently dispensed medication (new and refills) in 1990, exceeded only by amoxicillin and digoxin.⁵ Antisecretory drug prescriptions represented a wholesale market of over \$2 billion in 1989.⁶

Indications and dosage

Since cimetidine was released in 1977, three other histamine-2 antagonists have been released: ranitidine (Zantac), famotidine (Pepcid), and nizatidine (Axid). These drugs have equally high healing rates for patients with peptic ulcer disease. Indications, dosing regimens, and product summaries are listed in Table 1. All available H_2 receptor antagonists are approved for acute and maintenance therapy of duodenal

Table 1. Histamine-2 receptor antagonists product information

Generic name—*Cimetidine*

Brand name—*Tagamet*

Oral dosage forms	Indications	Maximum daily dosage	Duration of therapy	Dosage adjustments	Drug-drug interactions	Drug-disease interactions	Adverse drug reactions
Tab	Duodenal ulcer:			600 mg/d in severe renal impairment	Warfarin-like anticoagulants	Caution in pregnancy and lactation	GI: Diarrhea
200 mg	Short-term active	1,200 mg	4–8 weeks		Phenytoin		CNS: Dizziness
300 mg	Maintenance	400 mg	6 months		Ketoconazole		Headache
400 mg	Active benign gastric ulcer	1,200 mg	6 weeks		Propranolol		Reversible confusional states
800 mg					Chlordiazepoxide		Endocrine: Gynecomastia reversible impotence
Liquid	GERD (gastro-esophageal reflux disease)	1,600 mg	Up to 12 weeks		Diazepam		
300 mg/5 mL	Hypersecretory conditions	1,200 mg	Clinically indicated		Certain tricyclic antidepressants		
					Theophylline		
					Metronidazole		

Generic name—*Famotidine*

Brand name—*Pepcid*

Oral dosage forms	Indications	Maximum daily dosage	Duration of therapy	Dosage adjustments	Drug-drug interactions	Drug-disease interactions	Adverse drug reactions
Tab	Duodenal ulcer:			Creatinine clearance	Ketoconazole	Caution in pregnancy and lactation	Fever
20 mg	Short-term active	40 mg	6–8 weeks	<10 mL/min			Fatigue
40 mg	Maintenance	20 mg		max 20 mg/d			GI: Diarrhea
Oral suspension	Active benign gastric ulcer	40 mg	8 weeks				Cholestatic Jaundice
40 mg/5 mL	Hypersecretory conditions	80 mg, up to 640 mg/d	Clinically indicated				Vomiting
							Nausea
							CNS: Headache
							Dizziness
							Depression
							Anxiety

Generic name—*Nizatidine*

Brand name—*Axid*

Oral dosage forms	Indications	Maximum daily dosage	Duration of therapy	Dosage adjustments	Drug-drug interactions	Drug-disease interactions	Adverse drug reactions
Cap	Duodenal ulcer:			Creatinine clearance	Ketoconazole	Caution in pregnancy and lactation	Sweating
150 mg	Short-term active	300 mg	4–8 weeks	Short-term active:			Somnolence
300 mg	Maintenance	150 mg	1 year	20–50 mL/min,			Urticaria
	GERD (gastro-esophageal reflux disease)	300 mg	Up to 12 weeks	150 mg/qd			Reversible confusional states
				<20 mL/min,			
				150 mg/q2d			
				Maintenance:			
				20–50 mL/min,			
				150 mg/q2d			
				<20 mL/min,			
				150 mg/q3d			

Generic name—*Ranitidine*

Brand name—*Zantac*

Oral dosage forms	Indications	Maximum daily dosage	Duration of therapy	Dosage adjustments	Drug-drug interactions	Drug-disease interactions	Adverse drug reactions
Tab	Duodenal ulcer:			Creatinine clearance	Ketoconazole	Caution in pregnancy and lactation	Headache
150 mg	Short-term active	300 mg	4–8 weeks	<50 mL/min,			CNS: Dizziness
300 mg	Maintenance	150 mg	1 year	150 mg/qd			Insomnia
Liquid	Active benign gastric ulcer	300 mg	6 weeks				GI: Diarrhea
75 mg/5 mL	GERD (gastro-esophageal reflux disease)	300 mg	6 weeks				Nausea/Vomiting
	Hypersecretory conditions	300 mg, up to 6 g/d	Clinically indicated				

ulcers. All are effective in healing gastric ulcers, although nizatidine is not currently approved for this indication. Although relapses of gastric ulcers may be prevented with H₂ receptor antagonists, none of the currently available products are approved for maintenance therapy of gastric ulcer. Cimetidine, ranitidine, and, most recently, nizatidine, are also approved for the treatment of gastroesophageal reflux disease. Cimetidine, famotidine, and ranitidine also are approved for the treatment of hypersecretory conditions, such as Zollinger-Ellison syndrome, although large doses frequently are necessary.⁷

Full-dose H₂ blocker therapy for acute peptic ulcer disease and gastroesophageal reflux should not be prescribed for longer than eight weeks, as most studies indicate complete healing within that time.^{7,8} Some patients who are at high risk for relapse will require a longer course of treatment at a reduced dose. Although reduced dose maintenance therapy with H₂ receptor antagonists is effective in preventing symptomatic relapses in patients with duodenal and gastric ulcers, there are a number of reasons that physicians may not want to use these drugs for prophylactic therapy. First, about one-fourth of new patients with peptic ulcer disease will not experience relapse; as Feldman and Burton state,⁷ symptomatic relapses can be treated with short courses of H₂ blockers. Second, maintenance therapy is expensive, with an average cost of \$400 per patient per year. Lastly, the long-term safety of these drugs has not been established with certainty, since cimetidine has been on the market for only fifteen years and the other H₂ blockers for considerably shorter periods.⁷ For these reasons, many practitioners restrict maintenance to high risk patients (Table 2).

Duodenal ulcers are less likely to heal in patients who smoke cigarettes. Long-term maintenance therapy may be beneficial for smokers with duodenal ulcers, given the difficulties in getting patients to quit smoking.⁹ Nonetheless, physicians should encourage smokers with ulcers to quit, as

smokers are more likely to quit when physicians explicitly link tobacco use to a health problem.¹⁰

H₂ receptor antagonists can also prevent NSAID (non-steroidal anti-inflammatory drug) induced duodenal (but not gastric) ulcers in patients with arthritis, but whether this approach will be cost-effective in patients without a history of duodenal ulcer is uncertain.⁷

Pharmacokinetics

The absorption of the four H₂ receptor antagonists is rapid, with an average time to peak serum level of 1 to 3 hours. Serum half-lives of the H₂ receptor antagonists range from 1.5 to 4 hours in normal subjects. The elimination of all H₂ antagonists occurs by a combination of hepatic metabolism, glomerular filtration, and renal tubular secretion. Cimetidine, ranitidine, and famotidine are metabolized principally by the liver, while renal excretion is the main route of elimination for nizatidine.⁷ All four of these drugs require dosage reduction in the presence of renal disease, and cimetidine dosage should be reduced in patients with severe liver disease (Table 3). Dosage reduction may also be necessary in the elderly.⁷

Adverse effects

As a group, these drugs are safe with relatively few adverse effects (Table 4). All available H₂ blockers penetrate the cerebrospinal fluid, and cimetidine, ranitidine, and famotidine

Table 2. Persons at increased risk for duodenal ulcer recurrence⁹

Persons who smoke heavily
Persons with a long duration of symptoms (several years)
Patients with a previous history of an ulcer complication
Gastrointestinal bleeding
Perforation
Obstruction
Geriatric patients who are poor surgical candidates
Patients requiring indefinite long-term therapy with NSAIDs, aspirin, or steroids
Diseases associated with an increased incidence of peptic ulcer.
Chronic obstructive lung disease
Alcoholism with cirrhosis
Rheumatoid arthritis
Jejunum-ileal bypass for morbid obesity
Systemic mastocytosis
Basophilic leukemia
Chronic renal failure (adjust dosage)

Table 4. Adverse reactions associated with H₂ receptor antagonists⁷

Reactions	Percent
Diarrhea	1-3
Headache	2-3
Muscular pain	2
Constipation	1

Other side effects occurring with a prevalence of less than 1 percent include mental confusion, somnolence, gynecomastia, galactorrhea, impotence, loss of libido, blood dyscrasias, myalgias cardiovascular effects, skin reactions, hepatitis, and allergic reactions.

Reprinted with permission from the *New England Journal of Medicine* 1990; 323: 167-180.

have been reported to produce mental confusion in some patients, usually with high dose parenteral therapy. In ambulatory patients receiving oral therapy, central nervous system side effects, including mental confusion, have been reported to occur infrequently. While all four H₂ receptor antagonists have an excellent safety profile, more is known about ranitidine and cimetidine because they have been used in more patients for a longer period of time. Famotidine, nizatidine, and ranitidine differ from cimetidine in that long-term treatment at high doses, such as those used to treat hypersecretory states, is not associated with antiandrogenic adverse effects, such as gynecomastia and reduced libido. Therefore, these drugs may be preferred over cimetidine when high dose therapy is required.

Drug interactions

Drug-drug interactions should also be considered when choosing an H₂ receptor antagonist. Therapeutic doses of ranitidine, famotidine, and nizatidine do not significantly affect the elimination of drugs that are metabolized by the cytochrome P-450 mixed-function oxidase system. In contrast, cimetidine has been reported to decrease the hepatic clearance and increase the effect of theophylline, warfarin, phenytoin, lidocaine, and other drugs that are metabolized by hepatic microsomal enzymes. In addition, cimetidine, and to a lesser extent ranitidine, can decrease the renal tubular secretion of procainamide and N-acetyl procainamide and may potentially cause toxicity. There are also anecdotal case reports implicating ranitidine with rising serum theophylline concentrations. Therefore, it would seem prudent to closely monitor patients for signs of theophylline toxicity if ranitidine is added to a regimen containing theophylline.¹¹ Even though clinically significant drug interactions may occur with cimetidine and to a lesser extent with ranitidine, concurrent use of interacting drugs is not always an absolute contraindication. Concurrent use may be appropriate if proper monitoring and/or dosage adjustments are made. Practically, however, it is easiest to use a noninteracting H₂ blocker in patients receiving an interacting drug with a narrow therapeutic index. Alternatively, a lower daily dose and once-a-day dosing may reduce the magnitude of these potential drug interactions, as hepatic enzyme interactions with cimetidine appear to be dose related. However, smaller doses of cimetidine may be associated with slower rates of ulcer healing. Sucralfate is another option in patients taking multiple drugs, and its lack of systemic effects makes its use particularly appealing for elderly patients.

A drug interaction common to all commercially available H₂ receptor antagonists occurs when ketoconazole (Nizoral) is administered concurrently with an H₂ blocker. The increase in gastric pH impairs the dissolution and absorption of the ketoconazole. This does not occur with fluconazole (Diflucan).

Duplicative therapy

No more than one H₂ receptor antagonist should be pre-

scribed at a time. No data suggest that combinations of H₂ receptor antagonists improve outcome. In addition, even though the mechanism of action is different, the addition of misoprostol (Cytotec), omeprazole, or sucralfate with any H₂ receptor antagonist is no more effective than either drug used alone. Anecdotal clinical experience may suggest that a minority of patients with severe disease may respond to a combination of an H₂ receptor antagonist with sucralfate, but there is little justification to use this combination on an empiric basis.

Summary

All four H₂ receptor antagonists are equally effective when given in equipotent doses. Full dose therapy with these medications should be limited to eight weeks; maintenance therapy can be continued at a reduced dosage in patients with a high risk of relapse. Dosage may need to be modified in the elderly and in patients with renal disease. Drug interactions are more likely to be encountered with cimetidine and, to a lesser extent, ranitidine. Famotidine and nizatidine, although newer, appear to have less potential for interactions. There is little justification for combining other gastric antisecretory drugs with H₂ receptor antagonists. The indication, H₂ blocker dose, and duration of therapy should be clearly defined when initiating treatment with these efficacious but expensive drugs.

Normal sexual development of children: Physician roles in bridging gaps in parent-child communication

Steven H. Lipsius, M.D., M.P.H., F.A.P.A.

Dr. Lipsius is associate clinical professor of psychiatry and behavioral sciences and of obstetrics and gynecology, George Washington University School of Medicine; is a psychiatrist in private practice in Maryland and DC; and is certified as a sexual dysfunction therapist and supervisor by the American Association of Sex Educators, Counselors, and Therapists and the American Board of Sexology. Reprints: Steven H. Lipsius, M.D., 2141 K St., NW, Suite 404, Washington, DC 20037.

Physicians have opportunities to help a child have pride about his or her body, support the child's sexual self, and encourage shame-free limit setting. By supporting a parental coalition that is resilient and indivisible, physicians help children value their gender role, and may influence the outcome of sexual orientation.

Credit for the scientific approach to studying sexual behavior belongs primarily to physicians and not just to those who are psychiatrists. Contemporary with Freud,¹ Havelock Ellis,² an English physician around the turn of the century, turned the field from Victorian misimpressionism to scientific methodology. Van de Velde,³ Dickinson,⁴ and Masters^{5,6} are among other physicians credited with major advances in the field.

All physicians, even those not specifically treating children, have opportunities to influence the development of children. Progress in understanding family systems and, particularly, the impact of parents' attitudes and behavior on children, allow for more informed and precise therapeutic intervention.⁷⁻¹⁰

Repressing and projecting unacceptable thoughts and feelings occur frequently with sexual impulses and conflicts. The traditional view attributes this to our society still being partly in the wake of repression from the Victorian era, which makes it difficult for people to fully accept their own sexuality. This, in turn, makes it difficult for parents to fully accept their children's sexuality. Physicians have the opportunity to facilitate parent-child understanding and communication concerning normal childhood sexuality.

Recognizing parenthood as a developmental phase

The first separation and individuation phase of early childhood described by Mahler et al,¹¹ and the second individuation phase of adolescence described by Blos,¹² have been joined by the third individuation phase, that of parenthood, described by Colarusso.¹³ Complementary to these stages of psychological development are the equivalent components

of parenting processes, performed at times by teachers and mentors, as well as by physicians who work closely with children or their parents. The concept of parenthood as a developmental phase was actually originated by Benedek.¹⁴ This concept is relevant to the development of children because parents and equivalent others, relive and rework stages of their own development through their children, and may unwittingly draw their children unduly into this process.

Therefore, when a physician is listening to a parent describe a child's behavior, including sexual behavior, it is often helpful to ask parents what they recall about themselves, including their own sexual awareness when they were their child's age. It is often worthwhile to ask parents about their perception of their own parents' attitudes concerning sexual matters, keeping in mind that such perceptions may unconsciously be defensively distorted. Activating such thought processes may help parents discover that they may be automatically reacting to their child under the influence of what they themselves experienced, or believe they experienced, around that age. They may then recognize that they are projecting aspects of themselves onto the child, including expectations that may not apply to their child.

The physician's use of self in evaluating children

When evaluating a child who is reported to have a sexual problem, physicians can try to recall their own perceptions of sexuality when they were the child's age. This is more easily said than done because of the frequent presence of amnesia for such experiences. Though not providing a standard by which to rigidly evaluate the child's behavior, these recollections may provide clues to help understand what the child might be experiencing. The physician also needs to sort out those feelings that are primarily the physician's own from those induced in the physician by the child. For example, the physician may be aware of feeling judgmental about a child. These feelings may not represent how the physician truly feels but instead may be a reflection of how the child's parent or parents feel. This is because children sometimes unwittingly project their perception of their parents' disapproval of them onto the physician, inducing the feelings of disapproval in the physician. The physician needs to recognize these as transferred feelings and resist the tendency to counter-transfer feelings back onto the child by reacting critically (or seductively if such are the feelings originally transferred). Instead, the physician can reflect on the induced feelings as a valuable source of information concerning family processes.

Gender identity

The most important psychological determinant of the child's gender identity is the labeling of the child as a boy or a girl. Once this occurs, parents and others automatically bring to bear their full repertoire of expectations and interactions appropriate to that gender. Boy infants receive such comments as "Oh, he's a fighter!" Girl infants receive such comments as "Only a lady would keep us waiting so long!" Researchers using a Baby X technique in which the same

infant is variously identified as male or female to different adults, found the adults' responses to conform to the designated gender rather than to be congruent with the baby's actual gender.¹⁵ These preset responses highlight the importance of delaying assignment, with explanation to the parents, where the genital anatomy is ambiguous, as well as conducting the clarifying testing and decision making as quickly as possible.

Concerning the normal situation, Freis,¹⁵ a pediatrician, explains to the parents at one of the early well-baby visits that parents are communicating with their infants whenever they handle them. He explains that as parents, we express, nonverbally, a statement of gender to the baby; that is, we teach our children their gender identity and role by the way we speak to and handle them. Through a long series of such interactions, parents reinforce behavior perceived to belong to their child's gender and discourage behavior perceived to be associated with the other gender. By the time an infant is approximately 18 to 24 months of age, he or she has got the message and can usually identify both self and others by gender.¹⁵ This differentiation is consolidated in practically all children by 4 years of age.

The physician may detect parental ambivalence or outright parental disappointment about the child's being a boy or a girl before actual problems with gender identity emerge. Isolated imitation of opposite-sex mannerisms or occasional cross-dressing in the young child is not usually cause for concern. In contrast, consistent opposite sex behavior in the young child is cause for concern and intervention should begin as early as possible. Both parents should be included in the treatment with the child.¹⁶

Intervention is necessary not only to try to prevent transsexualism,¹⁶ but also to maximize chances of a later heterosexual outcome.¹⁷ (For some individuals a homosexual orientation will be the natural outcome, because of heredity¹⁸ or as a result of prenatal exposure to hormones.^{19,20} These individuals may at some point need their physician's help in accepting their sexuality, especially since society is heavily biased against nonheterosexual orientation.) A long-term prospective study with a comparison group revealed that approximately two-thirds of boys, ages 3 1/2 to 12 years, who were diagnosed as having a gender identity disorder of childhood, were found to be either bisexual or homosexual when reevaluated in later adolescence or young adulthood. The great majority had had no intensive psychotherapy during the interval; those receiving psychotherapy constituted too small a group for meaningful evaluation of treatment measures.²¹

Physician/parent comfort and sex education of children

Most important in sex education of children is the comfort level of the parents concerning sexual matters, at least as perceived by the children.

A retrospective questionnaire study of college students revealed that males' comfort regarding physical contact and affection correlated positively with their perception of their father's comfort ($p < 0.001$) and their mother's comfort ($p < 0.01$)

in speaking about sex, as remembered from childhood. For females, their comfort regarding physical contact and affection correlated positively with their remembered comfort in talking about sex with their mother ($p < 0.001$) and with their father ($p < 0.01$) when the women were children.²²

As physicians become more comfortable responding to parents' concerns regarding their children's sexuality, they increasingly provide good role models for parents who will then be more comfortable responding to their children's sexual concerns.

When children ask questions about sexual matters, it is best for parents to try to reach an awareness of the child's current understanding of the topic and to identify the child's current concern. This helps avoid the common mistake of telling the child too much at once. A well-known example is that of the parent who related a comprehensive story of the birds and the bees to her child in response to the question, "Where do I come from?" only to discover that the question was merely an inquiry regarding the geographical state in which the child was born.

Similarly, when parents ask physicians whether their child's sexual behavior is normal or not, physicians would do well to inquire about the parents' specific concerns, including what makes the parents think their child's behavior may not be normal. Such exploration may uncover incorrect information, erroneous beliefs, judgmental attitudes, or conflict within the parents themselves that requires further consideration. Even when the result confirms that the child indeed has a significant problem requiring professional intervention, such evaluation may help reveal to the parents the ways in which the parents contribute to the problem.

Another common mistake parents often make in response to questions by children is to fabricate an explanation with the intention of correcting it gradually as the child matures. The rationale usually involves protecting the child from factors that he or she is not ready to hear. The result may be, however, to establish a basis of distrust and/or confusion in the parent-child communication over sexual matters.²³ It is better to simply refrain from telling children what one has determined they are not yet ready to understand. If the parents do not know the right way to respond or are too anxious themselves to respond, then it is best to put off the answer until they are more composed and clearer as to how they wish to respond to their child. A delayed response is better than a hasty, anxious, and erroneous response.

Similarly, the physician who feels put on the spot by a parent's question concerning a child's sexual activity, can tell the parent he or she would like to research the question further, as one might do for other matters. This provides time for further consideration, including exploring one's own anxieties and sorting out one's own feelings, before resuming discussion of the matter at the next visit. There is certainly enough difference in opinion among the experts that no physician need feel inadequate in not coming up with the one best answer to all questions. As noted in the *Nelson Textbook of Pediatrics*, "All adults, and physicians above all, should be

extremely cautious in inferring meaning for the current or future sexual development of children from any isolated act or even a series of sexual acts."²⁴ It is helpful, however, to have some frame of reference and the following, while it can not be all-inclusive, will attempt to provide some structural framework.

The child's sexual self

It has been said that there are two theories of personality—the onion theory and the artichoke theory.²⁵ Peeling away layers of the onion results in nothing being left, whereas peeling away layers of the artichoke leaves a core at the heart. There are data suggesting that there is an irreducible sexual component within the core of the individual. This does not mean that it cannot be kept from developing and maturing.

To some degree, the infant is a sexual being from birth. Male infants, from birth or a few days after birth, have penile erections, and female infants are physiologically equipped for vaginal lubrication. Though initially such responses seem to be a physiologic reflex associated with urination and defecation, by the second half of the first year, accidental contact of hand to genitals leads to the discovery of pleasurable sensations and then to elaborate exploration in the form of pokes, pulls, and strokes.²⁶ In the process of self-exploration, infants come to recognize their genitals as especially sensitive body parts which, when stimulated, give them a sense of enjoyment.

Careful observers of young children believe sexual arousal occurs during focused genital self-stimulation beginning around 15 to 18 months of age.^{27,28} Some researchers believe this to be a central focus for the organizing of experience.²⁹

According to Chess and Habbibi,¹⁶ although there is no rule by which the normal frequency of masturbation can be judged, a child who is engaged in repeated daily autostimulation or prefers sexual games to all other activities, is in need of a psychiatric evaluation.

If parents' concerns appear to result from a lack of knowledge about childhood sexuality, the parents need reassurance that their child's behavior is not abnormal and is simply one part of his or her development of body awareness. Parents' objections to masturbation might have more to do with the time and circumstances under which their child's masturbation occurs. The parents need to be reminded that the child has not yet learned the social norms about the appropriate time and place for sexual behavior. The parents can be counseled to share these norms matter-of-factly with their children. It is important not to chide or shame children which could lead to feelings of anxiety, guilt, and fear concerning sexual activity. Children are susceptible to such guilt induction because they may already be struggling with guilt arising from their sexual fantasies. Harsh external interference may result in fixation on an internal process that otherwise would be satisfactorily resolved.

Excessive masturbation, where it is determined to not result from local irritation or inflammation, may be a symptom of general psychological disturbance for which the child uses sexual self-stimulation for comfort and consolation. At

times, it may serve less as a source of pleasure and more as a way of relieving tension and stress.

Where limit setting is necessary, the best guideline appears to be using the least intrusive method necessary to get the child to cease the behavior. It is generally best to interest the child in substitute activity or to distract the child in a way that allows face-saving rather than to put the child directly on the spot.

Sometimes, rather than indicating an abnormality in their child's behavior, the difficulty may stem from the parents' own sexual anxieties and doubts or from their inability to accept their child's having sexual feelings. At times, the child may be unwittingly used as a distraction from discord in the parents' marriage, sometimes a sexual problem or dysfunction. Having judged that the masturbation is not excessive, the physician does well to explore with the parents the possible reasons for their concerns, offering advice or making referral as needed.

It is natural for children to be curious about other children's and their parent's genitals, as well as their own. How else can the young scientist understand why all the fuss is made about the distinction between the sexes and how his or her genitalia differs from others.

In some cultures, the expression of sexual activity is more acceptable and is viewed as a childhood rehearsal for later mature sexual behavior. Nevertheless, limits may need to be set if not contained within acceptable boundaries. Abrupt sudden onset of intense sexual play may be an indication of sexual abuse, the possibility of which should be explored particularly if other factors raise this suspicion. The importance of detecting and stopping sexual abuse of children as quickly as possible is heightened by our increased understanding of the profound effects on the victims. In addition to the extreme disruption of the children's general psychological development, their sexual development is usually thrown completely off track, with a multitude of later consequences.³⁰⁻³²

Parents can help children put their curiosity into words.³³ For example, the child may not find the vagina by searching and is greatly helped by the parents' explanation as to its existence. Children who constantly intrude on adults' privacy can be told that it is natural for children to want to know how grownups are made and that they can ask what they want to know.

The child's persistent efforts to observe parents in the nude in a household where everyone covers up is often an indication that parents need to stop anxiously covering themselves when the child unexpectedly enters the room. Although some sex educators, such as Goghros,²³ believe parents need to occasionally allow the children to casually see them in the nude with follow-up explanations if the child appears interested, this has significant risk because it is difficult to gauge what might be overstimulating to the child. A safer way to practice what some³⁴ call sexual learning, in which parents create opportunities to explain sexual matters rather than waiting passively for the child to ask, is simply to invite questions when the child appears ready and needing to have information.

When children do ask about sexual matters, this is an opportunity not to be missed. Particularly for older children and adolescents, the inclusion of love and caring in discussions of sexual matters helps place sexuality in this broader context, shapes healthy sexual values, and may help prevent sexual activity for which the child is not sufficiently mature.

Physicians have the opportunity to provide a role model for parents in regard to openness and initiative about sexual issues by including in the review of symptoms, usually in the urogenital portion, a question regarding sexual functioning.

Gender role development

Helping the child have positive feelings about his or her body, either directly or through the parents, is one way of fostering a healthy sense of the child's masculinity and femininity. Other important determinants include the value placed by each parent on the child's masculinity or femininity, as well as each parents' demonstrated respect for their partner's gender role.³⁵

A girl needs to discover that being a girl has special satisfactions for her. A mother who has found satisfaction herself in being a woman will likely communicate this without words. A father who is pleased at having a daughter and who values femininity for itself, will give great impetus to the process of feminine identification in his little girl.³³

If the girl is a tomboy, the father might have to temper his romping with her to some degree. However, most important is to strengthen and promote the feminine side of the child. The satisfactions gained through playing boy will eventually diminish, without conflict over jeans, hairdo's, and manners. The boy pose may then be given up because being a girl has greater satisfactions. This does not necessarily require special mother-daughter jaunts, though this may help. Identification is achieved primarily through love and the wish to emulate a beloved person.³³

Children will often test the parents' relationship with one another and may stress the parental coalition. Whether or not parents know about or believe in an Oedipus complex, intense love attachments are a normal part of child development, particularly during the years 3 to 7. Children explore the limits of their masculinity or femininity by challenging the parent of their own gender, which may expose that parent's vulnerabilities.

Whether or not Jimmy's father knows why Jimmy is challenging his authority with a bedtime tirade, the father is obliged to deal with the behavior. In sending Jimmy off to his room, he is saying in effect, "I am your father and you are only a little boy."³³ The father needs to remain emotionally present in a firm but loving manner, and not allow himself to be emotionally gotten rid of. If the father overreacts, he may need a reaffirmation of his own masculinity so he will not treat the little boy as if he were a real rival. The mother generally does best to support the father in these situations, or at least not interfere. She needs to become aware of and temper any seductiveness on her part. If she disagrees with her husband's

approach, it is best they resolve the differences out of earshot of the child.

The physician's support of the resilient parental coalition can help avoid its being split through irreconcilable disagreements over the child or through competition to be the favored parent in the eyes of the child. Preservation of the parental coalition makes it easier for the boy to relinquish aspects of his love attachment to his mother and to identify with a firm and loving father figure. The strengthening and gradual internalization of identification with the same gender parent is believed by many to increase the chances of the individual's eventual sexual preference being of a heterosexual nature.¹⁷

Single parents, in particular, often need someone, such as a caring doctor, to help them relinquish the child's excessive love attachment to them. Physicians have the opportunity, themselves or through referral, to help parents improve their functioning, which can contribute to a healthier marriage in addition to helping their children.

Summary

The physician who has contact with the family, working with the child and/or with the parents, has the opportunity to influence the family system so as to facilitate the child's development of a normal gender identity, gender role, and sexual self.

WHY SHOULD YOU REFER CHILDREN AND ADOLESCENTS WITH SPINA BIFIDA TO CUMBERLAND HOSPITAL?

Cumberland Specializes in Child and Adolescent Care

Each year, some 200 pediatric patients ages 2-22 needing rehabilitation and behavior management are admitted to Cumberland Hospital for Children and Adolescents. While many hospitals provide excellent medical treatment, Cumberland adapts its programs to meet the social and psychological needs of young people.

Treatment is often incorporated into traditional adolescent activities. For example, treatment may include a basketball or volleyball game played in the gymnasium or the swimming pool. Individual mobility goals may be tested and explored during an outing to one of the local parks such as Busch Gardens (amusement park), Jamestown, Yorktown or Williamsburg.

For the young person with spina bifida, there is always a new challenge and a new opportunity to stretch his or her abilities and confidence.

Functional Mobility and Independence

The most visible and often most emotionally charged issue for the young person with spina bifida is mobility. Almost all children with spina bifida wear orthoses, and many use wheelchairs. Ambulatory skills are often achieved late and tend to reach a maximum in the 5- to 8-year-old age group.

With the approach of adolescence, there are increases in weight and height that make ambulation more difficult and less cosmetic.

Difficult decisions must be made regarding the young person's future. Cumberland assists patients and their parents in determining the form of mobility that is most acceptable to them, and help them structure their lives accordingly.

Adolescence is also a time when all young people begin to become independent, and independence for the young person with spina bifida means they take responsibility for their bowel and bladder program and for donning and doffing their braces.

Cumberland evaluates the gross and fine motor skills of the patients as well as their level of intellectual functioning. This information is needed to assist patients and their parents in setting reasonable expectations. Behavior and therapy programs are structured around these expectations.

Cumberland Is A Hospital

Cumberland is licensed by the Commonwealth of Virginia and accredited by the Joint Commission on Accreditation of Healthcare Organizations. It is one of only a few hospitals in the United States where all the physicians on the admitting staff are Board Certified in their specialty.

Cumberland Doesn't Look Like a Hospital

The hospital looks more like a small college with buildings connected by sidewalks, and picnic tables and recreation facilities are disbursed among the facilities. It is common to see young people in small groups talking, studying or

listening to music. Throughout the day, they go between the dormitory, cafeteria, rehabilitation, school and other buildings.

Depending on their level of physical abilities and behavior program, the young people are given levels of independence on the campus ranging from strict one-on-one staff supervision to free movement within the immediate environment.

Young People At Cumberland Go To School

One of the most important elements in the life of a young person is school, and at Cumberland patients go to school. Integrated into the hospital campus is Cumberland Academy—a licensed private school. The building includes classrooms, a library, prevocational department and gymnasium.

Course work is obtained from each patient's home school and classes are conducted around treatment and rehabilitation programs.

Cumberland Serves Many Different Young People

Cumberland provides treatment for young people with many types of medical and behavioral problems, and this has proved to be very beneficial for the patients with spina bifida. While there are usually a number of young people in the hospital with spina bifida, there are also patients with brain injury, diabetes, seizure disorders, spinal cord injuries, asthma and other conditions.

The young people quickly develop friendships and learn about the "disabilities and abilities" of the other young people. They leave the hospital with their medical needs treated and better able to cope with problems and challenges they encounter.

Cumberland's Setting

Cumberland is located on the Pamunkey River and is part of 1,200 acres owned by the hospital. There are three large lakes on the property for fishing and boating, and miles of trails.

For more information on Cumberland Hospital or to refer a patient for treatment, please call the information office at 1-800-368-3472.

Journey of the Maryland International Health Task Force to post-war Kuwait: May 19–27, 1991

The Kuwait 38

Thirty-eight physicians, nurses, hospital administrators, and support personnel—members of the Maryland Medical Task Force—journeyed to Kuwait in May 1991. The experience sensitized members of the Maryland delegation to the specific needs of post-war Kuwait in rebuilding its health care system.

Kuwait is a tiny country, slightly smaller than the state of New Jersey (Figure 1), located in the northeast Arabian peninsula on a gradually sloping plain rising westward from the Persian Gulf. It is a country of riverless desert with few oases and almost no arable land. Settled by the Anaiza tribe in the eighteenth century, the country has been ruled by an emir of the Al-Sabah family since 1751. Kuwait was a province within the Ottoman Empire from the sixteenth century until 1899, when the Emir signed a treaty making it a British protectorate; in 1961, Kuwait achieved independence. Prior to the Iraqi invasion of August 2, 1990, Kuwait had a population of approximately 2.1 million, of which only a quarter were Kuwaiti citizens. Approximately 85 percent of Kuwait's pre-war population lived in Kuwait City.

Origin of the Maryland Task Force

In a meeting with the Kuwaiti ambassador on February 13, 1991, Governor William Donald Schaefer offered Maryland business and humanitarian resources to the government of Kuwait for the rebuilding of the war-torn country. On March 5, 1991, Governor Schaefer and the Kuwait/Maryland Partnership announced specific plans for initiating such assistance. The governor's intention was for the business community, through its Kuwait/Maryland Partnership, to work with an International Health Task Force to deliver humanitarian aid. This was to be followed by efforts to develop long-term business contracts. The Maryland International

Figure 1. Kuwait.

Health Task Force evolved as an integral element of this general plan. "The Kuwait 38," as this task force came to be known, consisting of doctors, nurses, hospital administrators, and various support personnel (**Figure 2**), was to be the vanguard of the governor's humanitarian initiatives. It came to life as a result of the work of the secretary of the Maryland International Division; Maryland's Secretary of Health Nelson Sabatini; James A. D'Orta, M.D., an emergency physician and disaster planning specialist; and other members of the Kuwait/Maryland Partnership.

Journey to Kuwait City

The Kuwait 38 assembled at Franklin Square Hospital on May 19, 1991. (The funds to cover travel expenses came from

a variety of sources including the government of Kuwait, the US pharmaceutical industry, and Northwest Orient Airlines.) After a formal farewell from the governor and other dignitaries, the group traveled by bus to Kennedy airport and then to Dharan, Saudi Arabia, via a chartered 747 aircraft being sent to Saudi Arabia to transport US troops returning from Operation Desert Storm. We arrived in darkness at the air force base in Dharan on May 20 and were promptly met by US officials concerned with expediting our travel into Kuwait. Following a day's layover in Dharan because Kuwait was not ready to receive our delegation at the time of our arrival, arrangements were made to bus us overland through the Saudi Arabian desert to Kuwait City. The six-hour journey, which carried us due north over a narrow two-lane highway, was negotiated in one of only a few small caravans proceeding in that direction.

As we approached Saudi Arabia's northern frontier, we encountered Khafji, the site of Iraq's only offensive action during Operation Desert Storm. Images of the struggle for control of the town by Iraqi and coalition troops lingered among the rubble of the battle fought there. At the time of our arrival, widespread damage to many buildings left little doubt that fierce house-to-house fighting had occurred during liberation of the town by coalition forces.

We continued north for another hour, finally reaching the Kuwaiti border. On the way, we passed a continuous succession of convoys of military matériel proceeding south to Dharan and demobilization. Inverted Vs hastily painted on the sides of the vehicles identified them as coalition vehicles and conjured up memories of editorials on the role of friendly fire as a source of casualties in modern warfare.

Although our group arrived at the Kuwaiti border in the early afternoon, the day had aged prematurely owing to an effluvium of oil and dust (**Figure 3**), originating from the burning Al Ahmadi oil fields to the north and west of Kuwait City and a seasonal sand-

Figure 2. The Kuwait 38.

Figure 3. Haze over Kuwait resulting from the combined effects of Kuwait's burning oil fields and a seasonal sandstorm.

storm indigenous to the area. Two hours at the border for processing visas, and we proceeded north again to Kuwait City. Our first impression on entering the capital city of Kuwait was the juxtaposition of emptiness and grandeur. Boulevard upon boulevard of battered and deserted high-rise buildings faded sullenly from view as we slowly made our way to our final destination at the Al-Sabah Hospital complex. There we were to spend the next five days observing firsthand the results of Iraq's ten-month reign of terror.

Observations

Prior to the invasion, Kuwait boasted a medical care system as sophisticated as any in the world. Anyone requiring medical care received it, free of charge, at any of Kuwait's five specialty hospitals or associated clinics. In the rare instances where these modern and well-equipped facilities could not provide particular medical services, patients were transported to appropriate facilities outside the country. For Kuwaiti citizens, all expenses related to such care were defrayed by the government.

The Kuwaiti health care and medical education systems were patterned after the British model, with various specialty and general hospitals supported by a network of area referral centers located throughout the country. Because medicine has not traditionally been a particularly prestigious profession, compared with commerce, relatively few native Kuwaitis have chosen to become physicians. Like nurses and other support personnel who staffed the medical facilities prior to the invasion, physicians working in Kuwait were largely foreign nationals.

The hospitals of pre-invasion Kuwait were spacious, well-equipped, and efficient. There was a general hospital (Al-Sabah); a hospital devoted to pediatrics, neurosurgery, and ophthalmology (Ibn Sina); a burn, plastic surgery, and orthopaedic hospital (Al Razi); as well as a chest hospital, organ transplant center, cancer center, and maternity hospital. All of these facilities served a total population of little more than two million people.

As noted previously, physicians working in Kuwait were largely recruited outside the country. Most came from neighboring countries such as Egypt, Iraq, Jordan, and Syria. Others came from Pakistan and India. Physicians from communist block countries also came in large numbers to work in Kuwaiti hospitals.

There was a single medical school, which graduated approximately forty Kuwaiti nationals per year. Women accounted for over half of the Kuwaiti graduates. Since women in Kuwait have a lower social status than men, although a higher status than women in most other Persian Gulf countries, the high percentage of female medical graduates again reflects the relatively low level of esteem accorded the medical profession in traditional Kuwaiti society.

As a result of the invasion, Kuwait and its medical community suffered massive devastation. The following

vignettes illustrate the enormity of such devastation. Although they focus mainly on destruction of Kuwaiti property by Iraqi soldiers, in all probability, the social and psychological trauma related to the invasion will be the most crushing legacy of Iraq's aggression to the south.

As a direct consequence of the invasion, medical personnel in Kuwait shrank to one-third the normal complement of doctors and 10 percent of the normal nursing force. Much medical equipment was stolen or vandalized. Fortunately, the Kuwaitis managed to save many items by duping the Iraqis into taking or destroying old rather than new equipment—the new equipment having been hidden in false ceilings and other secret storage places. As a result, at the time of our visit, the three operating hospitals contained equipment comparable to that available in most US hospitals.

Saving such equipment from Iraqi hands involved no small measure of courage on the part of the Kuwaitis. The story of the head clerk of the storeroom at the Al-Razi Hospital typifies such bravery. Shortly after arriving in Kuwait City, the Iraqis deployed large numbers of soldiers in each of the city's hospitals. At the Al-Razi Hospital, a contingent of such soldiers were billeted in the hospital's store room. The clerk, anticipating the worst, hid much of the hospital's most expensive equipment in the store room's false ceiling just prior to the arrival of Iraqi soldiers. The penalty for his actions, if discovered, would have been death.

Kuwait's Transplant Center, the jewel in the crown of the country's hospital complex, became the headquarters for Iraqi troops stationed at the Al-Sabah Hospital Complex. Kidney, heart, liver, and pancreas transplants were performed at this new facility prior to the invasion. Kidney transplants were

one of its most important functions, because of the estimated 12 percent rate of chronic renal failure among the adult male population of Kuwait.

Because of the symbolic and material importance of the Transplant Center to the people of Kuwait, the Iraqis were particularly harsh in acts of vandalism directed at the facility. Operating rooms, as modern and beautifully equipped as any in Maryland, were systematically dismantled. The destruction was efficient, comprehensive, and senseless.

The Iraqis met almost no organized military resistance in taking Kuwait City. Furthermore, little, if any, fighting took place in the city during their withdrawal. Yet large areas of the city looked as if they had been under heavy bombardment for months (**Figure 4**). Such devastation was due to the work of Iraqi sappers or the result of gratuitous Iraqi artillery fire directed at civilian targets during the final days of occupation.

One of the more bizarre acts of vandalism by Iraqi forces was the pilfering of automotive tires and parts. We were told by several contacts that each tire had the equivalent worth of a month's salary for the average Iraqi soldier. During the occupation, the Iraqis established a complicated hierarchy concerned with confiscating rights to Kuwaiti tires. The tires from Mercedes Benz vehicles went to the highest ranking officers; lower ranking officers had rights to tires from Saabs and Volvos; the very lowest ranking soldiers had access only to bicycle tires.

During the occupation, the Kuwait Medical School suffered a fate similar to the country's hospitals. Faculty from the University of Baghdad came to Kuwait City on the heels of the invasion to supervise the systematic dismantling and plundering of Kuwait's university and medical school. As

one Kuwaiti professor described it, you could walk down the hall and find chemistry equipment with a Baghdad University label and another piece of equipment labeled for transport to some other Iraqi university. Inexplicably, the microbiology laboratory equipment was slated for transport to the presidential palace in Baghdad. The wholesale plundering of Kuwait's assets included the entire medical school library, as well as personal literary collections of the Kuwaiti medical faculty. Iraq also attempted to coerce many Kuwaiti faculty into moving north to teach in Iraqi universities but were rarely successful.

Figure 4. Destruction of Kuwait's telecommunications building by retreating Iraqi forces.

Accomplishments

One of Governor Schaefer's original mandates for the Maryland Medical Task Force was to provide hands-on clinical assistance in post-war Kuwait. Our accomplishments in this regard were, at best, modest. Members of the task force participated in clinical rounds with local physicians immediately upon arrival and continued these rounds throughout the five-day stay. Although there were few opportunities for our party to function as primary caregivers, there were several gratifying exceptions to our role as consultants and interested observers.

Soon after our arrival, our emergency medicine physicians and plastic surgeons attempted, unsuccessfully, to resuscitate a young boy with massive explosion injuries. Shortly thereafter, we observed and participated in the care of a child recovering from a shrapnel-induced spinal injury, another with massive facial and ophthalmologic injuries, as well as children and adults with major burns and amputations. We participated in the care of a septic 2-year-old child requiring an emergency laparotomy and colostomy revision. One of our surgeons successfully performed a pulmonary lobectomy on an elderly man with recurrent pneumothorax. Two of our plastic surgeons evaluated and treated an American fire fighter severely burned while attempting to extinguish one of the 400 oil fires still raging in Kuwait (Figure 5). The surgeons eventually coordinated the fire fighter's transfer back to the United States. Both our plastic and orthopaedic surgeons were consulted repeatedly by their Kuwaiti counterparts during the visit.

Transportation of several complicated cases to Maryland medical institutions was arranged by our team. These patients included an infant with bladder exstrophy, a young child with a congenital mid-facial cleft, a pregnant woman with disfiguring chest and abdominal burn scars, and a middle-aged man with severe cardiac valvular disease. Despite the sophisticated level of medical care in pre-war Kuwait, resources required to treat such patients were unavailable in the country at the time of our visit.

Humanitarian and educational aid to Kuwait resulting from our visit continues in various forms. Dr. Najeeb Al-Othman, the director of the pediatric intensive care unit (ICU) at Ibn Sina Hospital, will visit the Johns Hopkins Hospital as an observer in the pediatric ICU and in the Regional Pediatric

Figure 5. Burning wells in Kuwait's Al Ahmadi oil field.

Trauma Center. The Maryland Institute for Emergency Medical Services Systems (MIEMSS) has extended invitations to Kuwaiti colleagues to visit Maryland as fellows or observers in adult trauma care. The institute is also working to establish long-range cooperative initiatives concerned with constructing an appropriate national trauma program in Kuwait.

Aftermath

The question lingering in the minds of participants as well as those who watched the mission to Kuwait unfold is whether the visit by members of the Kuwait 38 in May of 1991 was a success. It would be difficult, even if we had had focused goals and objectives, which we did not, to ascertain the impact of any such health care initiative. The final effects of the mission on the relationship between Maryland and Kuwait will take years to realize.

Nevertheless, several cooperative ventures have already developed between Maryland organizations and Kuwait that augur well for future productive liaisons. In August, on the first anniversary of the invasion, Dr. Abdullah Al Hamadi, the assistant director of the Ibn Sina Hospital in Kuwait, presented testimony to a subcommittee of Congress pertaining to atrocities committed by Iraq during the occupation. During his visit to the United States, Dr. Al Hamadi toured the University of Maryland and the Johns Hopkins Medical Centers, exploring opportunities first raised by the Maryland delegation in Kuwait for postgraduate education in Baltimore. Through such efforts, it is hoped that Maryland will have a pivotal role in training the future leaders of Kuwait medicine.

In May 1991, Kuwait's Ministry of Education invited several members of the Kuwait 38 to return to his country in

August 1991 to present an in-depth program of stress debriefing. This follow-up mission involved twelve days of intense didactic and group education initiatives presented to Kuwait's leaders in education. The success of this endeavor was reflected by the fact that the Ministry of Education exerted considerable pressure on the team to remain in Kuwait for ten days longer than originally planned. In addition, representatives from Kuwait's Ministry of Education and various school districts in Kuwait visited Baltimore in November 1991 for two weeks of intensive training in stress-debriefing techniques.

During the original mission, several prominent Kuwaiti health officials expressed keen interest in the system of trauma management operating at the MIEMSS Shock Trauma Center. The current director of Kuwait's emergency medicine system, who received his masters in public health from the Johns Hopkins School of Hygiene and Public Health, will visit the Shock Trauma Center, the Department of Emergency Medicine at the University of Maryland Medical Center, and the Franklin Square Hospital Center in the near future. One purpose of his visit is to explore the possibility of developing similar programs in Kuwait.

Preliminary meetings have taken place between various members of the Kuwait 38 and representatives from the Kuwait Institute for Medical Specialization (KIMS) and the Ministry of Higher Education, whose responsibility will be to select new leadership concerned with reopening Kuwait's devastated medical school. Such meetings have explored ways in which Maryland's two medical schools might participate in the reconstruction of Kuwait's medical school.

The future

The journey of the Maryland Medical Task Force to Kuwait in May 1991 brought together representatives from health care systems in Kuwait and Maryland. It sensitized members of the Maryland delegation to the specific needs of post-war Kuwait in rebuilding its health care system. At the same time, Kuwaiti officials involved in that process learned of the commitment and capabilities of several Maryland institutions to assist with the task. Time will determine whether initiatives first conceived as a result of our trip will enable Maryland to participate in a meaningful way in the resurrection of Kuwaiti medicine and the development of the future leaders of that country's health care system. ■

Update on health status in Kuwait

James P.G. Flynn, M.D., M.P.H.

Dr. Flynn is director of Corporate Rehabilitation Services, University of Maryland Medical System, and former director, Maryland Institute for Emergency Medical Services Systems.

I was invited by representatives of the Ministry of Education and the Ministry of Public Health to return to Kuwait with a team of social workers, psychologists, and counselors in August 1991. A number of positive changes had occurred during the intervening three months. The return or recruitment of physicians and other members of the health care delivery team was evident, particularly in hospital clinical programs. Also, the leaders of the emergency medical services programs were replacing equipment stolen or vandalized during the occupation. A public awareness effort using visual, radio, and print media was underway to alert adults and children to the hazards of handling nondetonated ordnance. This campaign was most successful, since serious injuries among children, caused by explosion of these devices had been virtually eliminated.

Electricity and water had become increasingly available, and sewage disposal had improved. Pollution had diminished secondary to the capping of burning oil wells.

The emphasis on somatic conditions, apparent during our mission in May, had shifted to greater interest in the psychosocial condition and mental health status of the community. This was reflected in the Kuwaiti's enthusiastic acceptance of training initiatives conducted by other members of the Maryland team in the recognition, management, and prevention of these stress reactions. The country's healing was interrupted by a resurgence of anxiety caused by the Iraqi government's aggressive support of the abortive coup in the Soviet Union.

Physicians, social workers, psychologists, and educators from Kuwait came to the University of Maryland Medical Center on three occasions to interact with leadership staff and reinforce relationships established earlier in the year. It is anticipated that these interactions will continue to be mutually productive. ■

The ACCUPRIL Single-Agent CommitmentTM

Parke-Davis is confident that for many of your hypertensive patients ACCUPRIL will achieve the decrease in blood pressure you expect.

If, in your medical judgment, your patient requires a diuretic in addition to ACCUPRIL at any time during ACCUPRIL therapy, Parke-Davis will refund your patient's cost of the diuretic.*†

New!

ONCE-A-DAY ‡

ACCUPRIL[®]  TM
quinapril HCl tablets 10, 20, 40 mg

* See DOSAGE AND ADMINISTRATION section of prescribing information.

† If, after an adequate trial of ACCUPRIL alone, based on your medical judgment as the prescribing physician, you determine that your patient requires the addition of a diuretic, Parke-Davis will refund to the patient his/her cost for the diuretic prescription less any amount reimbursed or paid for by an HMO, insurance company, or any other plan or program. For more details, ask your Parke-Davis Representative or call 1-800-955-3077.

‡ In some patients, the antihypertensive effect may diminish toward the end of the once-daily dosing interval. In such patients, an increase in dosage or twice-daily administration may be warranted.

ACCUPRIL is available in 10, 20, and 40 mg tablets. Usual initial starting dosage is 10 mg once daily.

ACCUPRIL is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Please see brief summary of prescribing information on following page.

Accupril® (Quinapril Hydrochloride Tablets)

Before prescribing, please see full prescribing information. A brief summary follows.

INDICATIONS AND USAGE

ACCUPRIL is indicated for the treatment of hypertension. It may be used alone or in combination with thiazide diuretics.

In using ACCUPRIL, consideration should be given to the fact that another angiotensin-converting enzyme (ACE) inhibitor, captopril, has caused agranulocytosis, particularly in patients with renal impairment or collagen vascular disease. Available data are insufficient to show that ACCUPRIL does not have a similar risk (see WARNINGS).

CONTRAINDICATIONS

ACCUPRIL is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

WARNINGS

Angioedema: Angioedema of the face, extremities, lips, tongue, glottis, and larynx has been reported in patients treated with ACE inhibitors and has been seen in 0.1% of patients receiving ACCUPRIL. Angioedema associated with laryngeal edema can be fatal. If laryngeal stridor or angioedema of the face, tongue, or glottis occurs, treatment with ACCUPRIL should be discontinued immediately, the patient treated in accordance with accepted medical care, and carefully observed until the swelling disappears. In instances where swelling is confined to the face and lips, the condition generally resolves without treatment; antihistamines may be useful in relieving symptoms.

Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, emergency therapy including, but not limited to, subcutaneous epinephrine solution 1:1000 (0.3 to 0.5 mL) should be promptly administered (see ADVERSE REACTIONS).

Hypotension: Symptomatic hypotension was rarely seen in uncomplicated hypertensive patients treated with ACCUPRIL but, as with other ACE inhibitors, it is a possible consequence of therapy in salt/volume depleted patients, such as those previously treated with diuretics or dietary salt restriction or who are on dialysis (see PRECAUTIONS, DRUG INTERACTIONS, and ADVERSE REACTIONS). In controlled studies, syncope was observed in 0.4% of patients (N = 3203); this incidence was similar to that observed for captopril (1%) and enalapril (0.8%).

In patients with concomitant congestive heart failure, with or without associated renal insufficiency, ACE inhibitor therapy may cause excessive hypotension, which may be associated with oliguria or azotemia and, rarely, with acute renal failure and death. In such patients, ACCUPRIL therapy should be started at the recommended dose under close medical supervision. These patients should be followed closely for the first 2 weeks of treatment and whenever the dosage of antihypertensive medication is increased (see DOSAGE AND ADMINISTRATION).

If symptomatic hypotension occurs, the patient should be placed in the supine position and, if necessary, normal saline may be administered intravenously. A transient hypotensive response is not a contraindication to further doses; however, lower doses of ACCUPRIL or reduced concomitant diuretic therapy should be considered.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression rarely in patients with uncomplicated hypertension, but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease such as systemic lupus erythematosus or scleroderma. Agranulocytosis did occur during ACCUPRIL treatment in one patient with a history of neutropenia during previous captopril therapy. Available data from clinical trials of ACCUPRIL are insufficient to show that, in patients without prior reactions to other ACE inhibitors, ACCUPRIL does not cause agranulocytosis at similar rates. As with other ACE inhibitors, periodic monitoring of white blood cell counts in patients with collagen vascular disease and/or renal disease should be considered.

Fetal/Neonatal morbidity and mortality: ACE inhibitors, including ACCUPRIL, can cause fetal and neonatal morbidity and mortality when administered to pregnant women.

When ACE inhibitors have been used during the second and third trimesters of pregnancy, there have been reports of hypotension, renal failure, skull hypoplasia, and death. Oligohydramnios has also been reported, presumably resulting from decreased fetal renal function; oligohydramnios has been associated with fetal limb contractures, craniofacial deformities, hypoplastic lung development, and intrauterine growth retardation.

Prematurity and patent ductus arteriosus have been reported, although it is not clear whether these occurrences were due to the ACE-inhibitor exposure or to the mother's underlying disease. It is not known whether exposure limited to the first trimester can adversely affect fetal outcome.

A patient who becomes pregnant while taking ACE inhibitors, or who takes ACE inhibitors when already pregnant, should be apprised of the potential hazard to her fetus. If she continues to receive ACE inhibitors during the second or third trimester of pregnancy, frequent ultrasound examinations should be performed to look for oligohydramnios. When oligohydramnios is found, ACE inhibitors should generally be discontinued.

Infants with histories of in utero exposure to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion. Hemodialysis and peritoneal dialysis have little effect on the elimination of quinapril and quinaprilat.

No fetotoxic or teratogenic effects were observed in rats at quinapril doses as high as 300 mg/kg/day (180 and 30 times the maximum daily human dose when based on mg/kg and mg/m², respectively), despite maternal toxicity at 150 mg/kg/day. Tested later in gestation and during lactation, reduced offspring body weight was seen at ~25 mg/kg/day, and changes in renal histology (juxtaglomerular cell hypertrophy, tubular/pelvic dilation, glomerulosclerosis) were observed both in dams and offspring treated with 150 mg/kg/day. Quinapril was not teratogenic in the rabbit; however, as noted with other ACE inhibitors, maternal toxicity and embryotoxicity were seen in some rabbits at quinapril doses as low as 0.5 mg/kg/day (one time the recommended human dose) and 1.0 mg/kg/day, respectively.

PRECAUTIONS

General

Impaired renal function: As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including ACCUPRIL, may be associated with oliguria and/or progressive azotemia and rarely acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine have been observed in some patients following ACE inhibitor therapy. These increases were almost always reversible upon discontinuation of the ACE inhibitor and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some hypertensive patients with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when ACCUPRIL has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of any diuretic and/or ACCUPRIL may be required.

Evaluation of hypertensive patients should always include assessment of renal function (see DOSAGE AND ADMINISTRATION).

Hyperkalemia and potassium-sparing diuretics: In clinical trials, hyperkalemia (serum potassium >5.5 mmol/L) occurred in approximately 2% of patients receiving ACCUPRIL. In most cases, elevated serum potassium levels were isolated values which resolved despite continued therapy. Less than 0.1% of patients discontinued therapy due to hyperkalemia. Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with ACCUPRIL (see PRECAUTIONS, Drug Interactions).

Surgery/anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, ACCUPRIL will block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients

Angioedema: Angioedema, including laryngeal edema, can occur with treatment with ACE inhibitors, especially following the first dose. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to stop taking the drug until they have consulted with their physician (see WARNINGS).

Symptomatic hypotension: Patients should be cautioned that lightheadedness can occur, especially during the first few days of ACCUPRIL therapy, and that it should be reported to a physician. If actual syncope occurs, patients should be told to not take the drug until they have consulted with their physician (see WARNINGS).

All patients should be cautioned that inadequate fluid intake or excessive perspiration, diarrhea, or vomiting can lead to an excessive fall in blood pressure because of reduction in fluid volume, with the same consequences of lightheadedness and possible syncope.

Patients planning to undergo any surgery and/or anesthesia should be told to inform their physician that they are taking an ACE inhibitor.

Hyperkalemia: Patients should be told not to use potassium supplements or salt substitutes containing potassium without consulting their physician (see PRECAUTIONS).

Accupril® (Quinapril Hydrochloride Tablets)

Neutropenia: Patients should be told to report promptly any indication of infection (eg, sore throat, fever) which could be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with ACCUPRIL is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions

Concomitant diuretic therapy: As with other ACE inhibitors, patients on diuretics, especially those on recently instituted diuretic therapy, may occasionally experience an excessive reduction of blood pressure after initiation of therapy with ACCUPRIL. The possibility of hypotensive effects with ACCUPRIL may be minimized by either discontinuing the diuretic or cautiously increasing salt intake prior to initiation of treatment with ACCUPRIL. If it is not possible to discontinue the diuretic, the starting dose of quinapril should be reduced (see DOSAGE AND ADMINISTRATION).

Agents increasing serum potassium: Quinapril can attenuate potassium loss caused by thiazide diuretics and increase serum potassium when used alone. If concomitant therapy of ACCUPRIL with potassium-sparing diuretics (eg, spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes is indicated, they should be used with caution along with appropriate monitoring of serum potassium (see PRECAUTIONS).

Tetracycline and other drugs that interact with magnesium: Simultaneous administration of tetracycline with ACCUPRIL reduced the absorption of tetracycline by approximately 28% to 37%, possibly due to the high magnesium content in ACCUPRIL tablets. This interaction should be considered if coprescribing ACCUPRIL and tetracycline or other drugs that interact with magnesium.

Lithium: Increased serum lithium levels and symptoms of lithium toxicity have been reported in patients receiving concomitant lithium and ACE inhibitor therapy. These drugs should be co-administered with caution, and frequent monitoring of serum lithium levels is recommended. If a diuretic is also used, it may increase the risk of lithium toxicity.

Other agents: Drug interaction studies of ACCUPRIL with other agents showed:

- Multiple dose therapy with propranolol or cimetidine has no effect on the pharmacokinetics of single doses of ACCUPRIL.
- The anticoagulant effect of a single dose of warfarin (measured by prothrombin time) was not significantly changed by quinapril coadministration twice-daily.
- ACCUPRIL treatment did not affect the pharmacokinetics of digoxin.
- No pharmacokinetic interaction was observed when single doses of ACCUPRIL and hydrochlorothiazide were administered concomitantly.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Quinapril hydrochloride was not carcinogenic in mice or rats when given in doses up to 75 or 100 mg/kg/day (50 to 60 times the maximum human daily dose, respectively, on a mg/kg basis and 3.8 to 10 times the maximum human daily dose when based on a mg/m² basis) for 104 weeks. Female rats given the highest dose level had an increased incidence of mesenteric lymph node hemangiomas and skin/subcutaneous lipomas. Neither quinapril nor quinaprilat were mutagenic in the Ames bacterial assay with or without metabolic activation. Quinapril was also negative in the following genetic toxicology studies: *in vitro* mammalian cell point mutation, sister chromatid exchange in cultured mammalian cells, micronucleus test with mice, *in vitro* chromosome aberration with V79 chromated lung cells, and in an *in vivo* cytogenetic study with rat bone marrow. There were no adverse effects on fertility or reproduction in rats at doses up to 100 mg/kg/day (60 and 10 times the maximum daily human dose when based on mg/kg and mg/m², respectively).

Pregnancy

Pregnancy Category D: See WARNINGS, Fetal/Neonatal morbidity and mortality.

Nursing Mothers

It is not known if quinapril or its metabolites are secreted in human milk. Quinapril is secreted to a limited extent, however, in milk of lactating rats (5% or less of the plasma drug concentration was found in rat milk). Because many drugs are secreted in human milk, caution should be exercised when ACCUPRIL is given to a nursing mother.

Geriatric Use

Elderly patients exhibited increased area under the plasma concentration time curve (AUC) and peak levels for quinapril compared to values observed in younger patients; this appeared to relate to decreased renal function rather than to age itself. In controlled and uncontrolled studies of ACCUPRIL where 918 (21%) patients were 65 years and older, no overall differences in effectiveness or safety were observed between older and younger patients. However, greater sensitivity of some older individual patients cannot be ruled out.

Pediatric Use
The safety and effectiveness of ACCUPRIL in children have not been established.

ADVERSE REACTIONS

ACCUPRIL has been evaluated for safety in 4960 subjects and patients. Of these, 3203 patients, including 655 elderly patients, participated in controlled clinical trials. ACCUPRIL has been evaluated for long-term safety in over 1400 patients treated for 1 year or more.

Adverse experiences were usually mild and transient.

Discontinuation of therapy because of adverse events was required in 4.7% of patients treated with ACCUPRIL in placebo-controlled hypertension trials.

Adverse experiences probably or possibly related to therapy or of unknown relationship to therapy occurring in 1% or more of the 1563 patients in placebo-controlled hypertension trials who were treated with ACCUPRIL are shown below.

Adverse Events in Placebo-Controlled Trials

	ACCUPRIL (N = 1563) Incidence (Discontinuation)	Placebo (N = 579) Incidence (Discontinuation)
Headache	5.6 (0.7)	10.9 (0.7)
Dizziness	3.9 (0.8)	2.6 (0.2)
Fatigue	2.6 (0.3)	1.0
Coughing	2.0 (0.5)	0.0
Nausea/Vomiting	1.4 (0.3)	1.9 (0.2)
Abdominal Pain	1.0 (0.2)	0.7

Clinical adverse experiences probably or possibly related, or of uncertain relationship to therapy, occurring in 0.5% to 1.0% (except as noted) of the patients treated with ACCUPRIL (with or without concomitant diuretic) in controlled or uncontrolled trials (N = 4397) and less frequent, clinically significant events seen in clinical trials or post-marketing experience (the rarer events are in italics) include (listed by body system):

General: back pain, malaise

Cardiovascular: palpitation, vasodilation, tachycardia, heart failure, hyperkalemia, myocardial infarction, cerebrovascular accident, hypertensive crisis, angina pectoris, orthostatic hypotension, cardiac rhythm disturbances

Gastrointestinal: dry mouth or throat, constipation, gastrointestinal hemorrhage, pancreatitis, abnormal liver function tests

Nervous/Psychiatric: somnolence, vertigo, syncope, nervousness, depression

Integumentary: increased sweating, pruritus, exfoliative dermatitis, photosensitivity reaction

Urogenital: acute renal failure

Other: amblyopia, pharyngitis, sinusitis, bronchitis, agranulocytosis, thrombocytopenia

Angioedema: angioedema has been reported in patients receiving ACCUPRIL (0.1%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with ACCUPRIL should be discontinued and appropriate therapy instituted immediately. (see WARNINGS.)

Clinical Laboratory Test Findings

Hematology: (See WARNINGS)

Hyperkalemia: (See PRECAUTIONS)

Creatinine and blood urea nitrogen: Increases (>1.25 times the upper limit of normal) in serum creatinine and blood urea nitrogen were observed in 2% and 2%, respectively, of patients treated with ACCUPRIL alone. Increases are more likely to occur in patients receiving concomitant diuretic therapy than in those on ACCUPRIL alone. These increases often remit on continued therapy.

* In some patients, the antihypertensive effect may diminish toward the end of the once-daily dosing interval. In such patients, an increase in dosage or twice-daily administration may be warranted.

Morris Plains, New Jersey 07950

James McHenry, M.D. of Fort McHenry in Baltimore Towne

Joseph M. Miller, M.D.

Dr. Miller is a retired surgeon from Timonium.

James McHenry, M.D., whose name is best known for the fort immortalized in the Star Spangled Banner, was one of the early members of Med Chi. In addition, he was secretary to George Washington; aide to Lafayette; member of the Maryland Senate, the General Assembly of Maryland, and the US Congress; and signer of the Constitution.

The recent observation of the bicentennial of the Constitution also commemorated the men who were involved in the creation of a strong central government. For twenty-two of the thirty-nine signers, their experiences as veterans of the Revolutionary War made them more than conscious of the necessity of safeguarding the individual liberties for which they had fought. The group were patriots and leaders by any definition; they fought the war, created and signed the Constitution, and forged a different kind of government. One of these men lived in Maryland and is truly representative of the entire group.

Fort McHenry was immortalized by Francis Scott Key when he wrote the words to the *Star Spangled Banner* during the night and early morning of September 13–14, 1814. Although the people of Maryland recognize the name of the fort, few know about the intriguing individual who gave his name to the site.

James McHenry, born in Ireland in 1753, was sent to Dublin by his parents and received a classical education.¹⁻⁵ He sailed for the colonies in 1771.

Early on, he was in the care of Captain William Allison in Philadelphia whose stepdaughter, Margaret Caldwell, he subsequently married. McHenry was so enamored with life in the colonies that he persuaded his parents, who brought along a younger brother, to emigrate to America in 1772. In the following year, the father, in company with his son John, established a business in Baltimore.

McHenry went to the Academy in Newark, Delaware in 1772, and then to Philadelphia to study medicine with Dr. Benjamin Rush. The budding medical student was enrolled with Rush when the momentous political events preceding the Revolution occurred. Two sessions of the General Congress made Philadelphia a remarkable place for studies beside medicine. Inasmuch as Rush knew George Washington very well, reason suggests that he may have introduced McHenry to the future president with whom McHenry later formed a firm friendship.

The patriotic Dr. McHenry settled his affairs in Philadelphia after the

war started and in January 1776, volunteered for the army as an assistant surgeon at the American Hospital in Cambridge. He was not yet an officer but his work had to be more than acceptable, for on August 26, 1776, Congress passed the following resolution: "Resolved that Congress have a proper sense of the merit and services of Doctor McHenry, and recommended it to the Directors of the different hospitals belonging to the United States to appoint Doctor McHenry to the first vacancy that shall happen of surgeon's birth (sic) in any of the said hospitals." On August 10, McHenry became surgeon to the Fifth Pennsylvania Battalion stationed at Fort Washington.

When that site was attacked and taken by the British on November 16, McHenry, four other surgeons, and 2,000 men were captured. He was granted a parole on January 27, 1777, and, in that status, reported to Washington on January 31. More than a year elapsed before an exchange was effected because it was not until March 5, 1778 that Alexander Hamilton, then aide-de-camp to the commander-in-chief, wrote McHenry about the announcement.

On May 15, McHenry was made secretary to Washington. He established cordial relations with his chief who later looked upon McHenry as a trusted friend and adviser. He stayed with the Washington family until August 1780, when he became aide-de-camp to Marquis Lafayette. There McHenry remained until he resigned from the army on December 3, 1781 after the surrender of Cornwallis at Yorktown. He was present at the ceremony that marked the last incident in his military life.

Washington might have feared the ardor of the marquis who was given an important command at the age of 23. The commander-in-chief probably took the precaution of giving Lafayette a prudent adviser in the person of McHenry.

McHenry was promoted to major on May 30, 1781, with the date of rank being October 30 of the previous year. The promotion was accomplished through the efforts of General Greene to the commander-in-chief, after Hamilton had failed in an appeal made by General Schuyler.

While still in the army at Yorktown, McHenry was elected to the Maryland Senate. At that time, the legislative body consisted of fifteen members—nine from the western shore and six from the eastern. They were elected for a term of five years by thirty-eight electors chosen by the people in the counties. McHenry held this post until he resigned early in 1786. In 1783, McHenry was also appointed to the US Congress when the incumbent died, and he was then elected to the position later that year. McHenry was returned to office the following year and held the post until 1786. Double duty with the state and the nation was not an uncommon occurrence at that time.

He was a delegate to the Constitutional Convention in Philadelphia in 1787 and also a signer of the Constitution. He participated in the state convention that adopted the Constitution in April 1788. In the autumn of the same year, he was elected to the General Assembly of Maryland and returned there the following year. In 1791, he was sent to the Maryland

Senate and he remained seated there until he became Secretary of War for Washington, a period of almost five years.

Washington had great esteem for McHenry, as evidenced by an extract from a note of January 20, 1796: "that it would now give me sincere pleasure if you will fill the office of Secretary of War." With frank candor, the president told of three previous tenders of office made and refused. Washington added, "nothing would add more to the satisfaction this would give me than your acceptance of the offer." On January 24, McHenry accepted; the nomination was promptly sent to the Senate and unanimously confirmed.

John Adams, the new president in 1797, kept the four incumbent members of the cabinet. Service with Adams, however, was not smooth. Toward the end of Adams' term in office, signs were apparent that he would not be reelected. In addition, his cabinet was not in sympathy with his thoughts. McHenry was a staunch Federalist and maintained his political relationship with Hamilton. Adams falsely charged McHenry, the soul of honesty, with a list of what he thought were transgressions, including a suspicion of intrigue against his reelection as president. A stormy interview followed and McHenry promptly resigned from his position on May 6, 1800 and returned to private life, which he continued until his death in Baltimore in 1816. He was buried in the churchyard of the Westminster Presbyterian Church in Baltimore.

McHenry was a statesman and although lacking experience in the administration of a large military organization, he applied the knowledge gained from his wartime effort as a citizen-soldier to create a disciplined, professional army. His dedication to a strong central government led him to advocate civilian leadership, a concept also held by Washington. This concept of McHenry was challenged, however, by newly appointed generals who attempted to control military appointments and organizational plans for the provisional army. McHenry was convinced that dedicated professional officers were necessary, and this thought led to his proposal for the creation of a military academy. Perhaps the most important service McHenry rendered to his country was his forthright stand against some of these military mights and their political adherents.

Two other episodes in his life are worthy of recall. The naming of the fort and his efforts to establish a military school, now known as West Point, were significant events.

As early as January 30, 1770, the Maryland Congress of Deputies recognized that Baltimore should be fortified if practicable.⁶ Within nine days, a request was forwarded to the Baltimore Committee of Observation to furnish a chart of the North East Branch of the Patapsco River at Whetstone Point. The council lost little time in seeking engineering assistance and on February 2 went to the selected area to learn about the possibility of fortifying the site. A proposal was submitted and approved, and the Baltimore committee agreed to undertake and complete the project for about 6,200 pounds. The sum was provided and work began on February 13.

The initial fortification was apparently limited to a shoreline gun battery to which another group of guns and a

breastwork were added later. The area was then called the Fort at Whetstone Point. During the winter of 1778, the area was equipped with thirty-eight cannon. With the Revolution drawing to a conclusion, however, all but four to five artillery pieces were removed from the fort for use elsewhere.

The fortification at that time was described as an earthen embankment conforming to a five-pointed star surrounded by a ditch. The shore batteries were on lower ground on the tip of Whetstone Point.

After the surrender of Cornwallis, the Baltimore defenses were in an unimproved and neglected condition. On March 20, 1794, congressional legislation was enacted to provide for the defense of certain ports and harbors in the United States. The president was granted authority to proceed with the plan. The Baltimore share of this program was a little over four thousand dollars, a sum intended to erect parapets, embrasures, battery platforms, two magazines, and barracks.

Choosing a site on which to spend this money did not offer a problem. The land at Whetstone Point was provided by an act of the Maryland Legislature and the consent of the local property owners. The appropriation was sufficient to accomplish only a little of the work and a further sum of three thousand dollars was obtained to improve the outer works but not the fort.

During the period of 1798–1800, really significant changes were made because of the fear of a war with France. Another eighty thousand dollars was expended to create an effective defense unit now known as Fort McHenry. A shortfall of thirty thousand dollars was envisioned and the thought of a public subscription was entertained, but Secretary of War McHenry resolved the difficulty by increasing the appropriation to the needed amount. Between 1794 and 1801, almost ninety-four thousand dollars were spent to complete the changes.

The fortification at Whetstone Point had never been the objective of enemy action until 1814. In September of that year, however, Baltimore was able to defend itself nobly at Fort McHenry during the British attack. Being a staunch Federalist, McHenry opposed entering the War of 1812. Interestingly and perhaps slightly ironically, he lived to see his son John follow in his footsteps as a volunteer soldier. John participated in the defense of Fort McHenry against the British forces in 1814.

During the Civil War, Maryland was the site of two prisons for captured Confederate soldiers. In July 1863, after the battle of Gettysburg, over 6,000 prisoners were crammed into Fort McHenry, which ordinarily housed 250–300 persons. Living and hospital conditions were abysmal.

McHenry was also interested in the creation of a military school and on December 26, 1798, Hamilton wrote of having left with General Pinckney thoughts about such a project and inquired of McHenry if he had heard further about the project. In June 1799, McHenry proposed establishment of a military

school to Adams. Later in the same month, the secretary wrote Samuel Sewell, Chairman of Defense, about the academy. McHenry wanted instructors in arithmetic, geometry, mechanics, hydraulics, and designing, for courses needed to prepare artillerymen and engineers for the art of fortification.

Early in January 1800, Adams recommended to Congress the creation of a formal military school, based on the thoughts of Hamilton and McHenry. In March of that year, McHenry asked Hamilton to prepare a bill for this project.

The Medical and Chirurgical Faculty of the State of Maryland was formed in 1799 when McHenry was a resident of Baltimore. He is listed as a member but was not among the 101 incorporators of the faculty. A distinction between a license and membership was not made between 1799 and 1839.

McHenry lived in an area that is now included in downtown Baltimore. The name of his estate was Fayetteville, presumably in honor of the general with whom he served at the end of the war. At that time, the home was south of the Frederick Turnpike and slightly west of Cove Street. Frederick Turnpike is now Baltimore Street and Cove Street has become Freemont Avenue. Orientation on a map of the inner city places the site slightly west of the University of Maryland Hospital.

He spent his summers in Garrett County, of which John W. Garrett and he were cofounders. In 1810, McHenry bought land for his son in Locust Tree Bottom, which included Buffalo Marsh near Hayes. The town of McHenry, named for the doctor, is 11 miles northeast of Oakland on the northern inlet of Deep Creek Lake.

Dr. James McHenry was a remarkable man at any time. As a doctor, prisoner of war, member of the military staff of Washington, and aide to Lafayette, he saw military service for five years. From 1781 to 1800, he occupied positions of trust in the state and nation, and these were climaxed by his activities at the Constitutional Convention and by being Secretary of War for Washington. Truly, McHenry was a man of many parts and one for all seasons.

TOUGH, SMART AND YOURS

medical
economics

Successfully defending a brain-damaged baby case is the courtroom equivalent of pitching a no-hitter. Because the "sympathy factor" can add millions to a jury's award, many insurance carriers would rather settle than fight.

Not so the P-I-E Mutual Insurance Co. of Cleveland, Ohio, and the 4-year-old law firm—Jacobson, Maynard, Tuschman & Kalur—that does all its defense work. In 21 brain-damaged baby cases it has defended for the doctor-owned company, its record is a remarkable 19-1-1, the last a hung jury. In 1988 it over all scored a total of 31 wins, 3 losses—all malpractice cases.

There's more to those numbers than luck. "Or even legal skill," adds JMT&K founding partner Aaron Jacobson, who was one of Ohio's leading plaintiffs' lawyers before he, Larry E. Rogers, Herbert S. Bell, M.D., and 70 other Cleveland doctors formed P-I-E in 1975.

"It's the concept behind the firm that makes it work. Physician specialty panels review every lawsuit to decide whether the defendant deviated significantly from the standard of care. If he did, we pay. If he didn't, we defend. Makes no difference whether it's a \$5,000 or a \$5 million case. We label it 'No pay.' That policy has resulted in a lot of cases being dropped. Perhaps more important, it's

DON'T YOU WISH THESE DEFENSE LAWYERS WERE YOURS?

This big, multistate firm rarely loses a case. But it's more than luck, or even legal skill, that's behind its enviable record.

By Howard Eisenberg

discouraged the filing of many other cases. Plaintiffs' attorneys have learned that we're fair negotiators when our doctors in the wrong, but won't back down when he's right."

That approach pays off. "According to the most recent report I've seen from the General Accounting Office," says Larry Rogers, P-I-E president and CEO, "in 1984, about 37 percent of medical-malpractice claims were closed without payment. Through 1988, we've closed an average of 75 percent of our cases without a dime changing hands. And it's my understanding that, without including defense costs, St. Paul Fire and Marine Insurance Co.'s 1988 average gross payout for cases closed in Ohio with payment was \$52,500. Our comparable figure was about \$19,000 below

that. That's partly why we can sell an OHG specialty in Ohio—an industrial state that ranks among the most litigious—\$12 million in coverage for just \$26,000."

The unique marriage of P-I-E and JMT&K has been so successful that the carrier has expanded into five other states: Indiana, Kentucky, Maryland, Missouri, and West Virginia. Where P-I-E goes, there goes JMT&K, with some branch offices to date. The firm has 60 trial attorneys, and may well be the nation's largest devoted to the nation's largest medical-malpractice defense.

Could the insurer-defender symbiosis, if duplicated by other doctor companies, make a significant contribution to reducing malpractice litigation nationwide? An up-close look at

how JMT&K operates may help to answer that question.

Every lawyer develops a medical specialty

"Our firm's lawyers read more medical books than law books," says P-I-E Vice President Gerard C. Ogenmuth, himself a veteran defense attorney. Robert Maynard explains, "New cases are discussed at our weekly staff meeting so that every lawyer is familiar with every case. But we assign cases to four attorneys according to medical specialty. They're well-versed in their fields, so they don't have to reinvent the wheel with each case."

Last year, the firm's OHG specialist, attorney Jerome S. Kalur, who had won 16 consecutive brain-damaged baby cases, faced one of his toughest challenges when he defended a GP

who'd attempted a midwifery delivery that ended in a Cesarean section and a severely brain-injured baby. Recalls Kalur, "I didn't think the doctor had caused the damage, but our position was weakened by the fact that he didn't have midwifery privileges. Based on that departure from the standard of care, our doctor panel voted to settle, and, since the hospital was also involved, a combined sum of \$1.5 million was offered. Plaintiffs turned us down flat."

"I wanted to depose the doctor, who'd been involved in the mother's care during her hospitalization, but the attorney for the plaintiff baby insisted it would violate the mother's physician-patient confidentiality. That privilege would terminate automatically when her medical

records were introduced at the trial end of the plaintiff's case. Meanwhile, I was in the courtroom of having to tell the jury 'It couldn't have been the midwife's,' without offering them another reasonable brain damage theory."

Fortunately, the plaintiffs rested their case on a Friday afternoon, giving JMT&K time for a weekend rally. "Twenty minutes later," says Kalur, "I was in the hospital pathologist's office with an order permitting me to view the mother's placental slides." Microscopic staining had been charted, and Kalur had a hunch that fetal distress had begun long before the for

A 45-year-old female with abdominal pain, ascites, and bilateral uterine adnexal masses

Participants: Rene R. Genadry, M.D.;
Robert J. Kurman, M.D.; George P. Saba, M.D.;
and Charles E. Kramer, M.D.

PRESENTATION OF CASE

The patient is a 45-year-old white female, gravida 2, para 2, with a recent history of abdominal pain and increasing abdominal girth. The patient was in her usual state of good health until 20 months ago when she began to experience progressive abdominal pain. Examination three months later revealed ascites and bilateral uterine adnexal masses. A barium enema indicated the presence of an extrinsic mass in the pelvic and distended loops of bowel. Abdominal paracentesis cytology demonstrated adenocarcinoma cells. An endometrial biopsy revealed a mucin-secreting adenocarcinoma. An exploratory laparotomy demonstrated bilateral adnexal masses with disseminated cancer seeding the peritoneum, serosal surfaces of the intestine and urinary bladder, the peritoneal surface of the diaphragm, and the omentum. A total abdominal hysterectomy with bilateral salpingo-oophorectomy and a total omentectomy were performed. Residual tumor nodules of less than 1.0 cm in diameter remained after cytoreductive surgery. Estrogen and progesterone receptor assays of the tumor tissue were positive. The patient was treated with a single

cycle of chemotherapy consisting of cytoxan, adriamycin, and cisplatin, without response.

Two months later, the patient was hospitalized for a partial bowel obstruction. Colonoscopic examination and biopsy demonstrated the presence of an incidental tubular adenoma. A second abdominal paracentesis performed at this time revealed a few markedly atypical cells suspicious for tumor. The patient underwent endoscopy that revealed changes compatible with linitis plastica, but gastric brushings failed to confirm the presence of a gastric tumor. Nevertheless, the chemo-therapeutic regimen was changed to include 5-fluorouracil (5-FU), Adriamycin, and mitomycin-C. The patient continued to have persistent bowel obstruction related to extensive tumor involvement of the peritoneal cavity. She also developed edema of the upper extremities. A subsequent venogram demonstrated obstruction of the right subclavian, left innominate, and portions of the left subclavian veins, related either to catheter-induced thrombosis or, alternatively, Trousseau's syndrome. The patient was initially treated with streptokinase, which was subsequently discontinued because of conjunctival hemorrhage. She was then placed on intravenous (IV) heparin therapy that was continued following discharge.

At home, the patient developed edema of the face, especially periorbital (thought to be consistent with a superior vena caval syndrome), and edema of the right foot associated with prominent superficial veins.

Four months later, the patient developed ascites and a left pleural effusion for which chemotherapy was begun. Over the next nine months, she had multiple hospital admissions for presumed Hickman catheter-related sepsis. An abdominal computed tomography scan (CT) performed fourteen months after symptoms were first noted demonstrated increasing ascites and suggested carcinomatosis, which was confirmed by cytologic studies. The patient was treated with Megace and Tamoxifen without clinical response. She underwent upper gastrointestinal endoscopy four months later, which demonstrated severe esophagitis and hourglass deformity of the stomach. Cytologic and histologic examination demonstrated esophageal ulceration and gastric mucosal edema with chronic inflammation, but no cancer cells were identified. A gastrostomy tube was placed at this time, but the patient began to develop progressive dyspnea with associated hypoxemia and metabolic alkalosis thought to be related to gastric acid losses through the gastrostomy tube.

The past medical history elicited included curettage of a benign right lower extremity bone tumor at 15 years of age and upper arm fracture requiring open reduction and internal fixation at age 16.

From the Johns Hopkins School of Medicine where Dr. Genadry is associate professor, Department of Gynecology and Obstetrics; Dr. Kurman is professor of pathology and director of gynecologic pathology, Department of Pathology; Dr. Saba is associate professor and director of the Division of General Diagnostic Radiology; and Dr. Kramer is a pathologist in the Department of Pathology.

Dr. Bhagavan is associate professor of pathology, Johns Hopkins School of Medicine, and pathologist-in-chief, Sinai Hospital. Dr. Wenk is assistant professor of pathology, Johns Hopkins School of Medicine, and head of clinical pathology, Sinai Hospital.

Menarche was at age 15 with regular cycles. She had had cervical dilatation and endometrial curettage at 26 years of age, and an elective tubal ligation at 34 years of age. She had had two normal vaginal deliveries without complications, 21 and 24 years previously. There were no known drug allergies. There was no history of alcohol abuse or smoking. Her current medications included Carafate, Zantac, and Tylox for pain and hyperalimentation.

On physical examination, her temperature was 37.3° C, respirations were 20 per minute, pulse was 124 per minute, and blood pressure was 110/70 mm of mercury. She weighed 56.0 kg. She was a moderately well-nourished, well-developed white female with marked abdominal distention. Her cheeks were puffy, sclerae were non-icteric, and her pupils were equal, round, and reactive to light and accommodation. Her lungs were clear with decreased breath sounds bilaterally at both bases.

There were no breast masses or nipple discharge. Her heart rate was regular and the rhythm was normal without gallops, murmurs, or rubs. A well-healed, lower-abdominal, midline scar was present. The abdomen was soft and nontender with marked diffuse distention, unchanged from recent examination; there was no guarding or rebound. Bowel sounds were active. A gastrostomy tube was draining bile-colored fluid. Extremities showed mild lower-extremity edema. Neurologic examination showed no focal deficits.

Her serum sodium was 141 mEq/L; potassium, 4 mEq/L; chloride, 104 mEq/L; bicarb, 30 mEq/L; blood urea nitrogen (BUN), 25 mg/dl; creatinine, 0.9 mg/dl; glucose, 62 mg/dl; calcium, 8.4 mg/dl; uric acid, 2.2 mg/dl; total protein, 5.3 gm/dl; albumin, 2.9 gm/dl; alkaline phosphatase, 122 U/L; lactate dehydrogenase (LDH), 390 U/L; amylase, 70 U/L; hematocrit (Hct), 28.2 percent; white blood count (WBC), 11,200/mm³; and platelets, 40,000/mm³. Her mean corpuscular volume (MCV) was 98.6 fL. The prothrombin time (PT) was 1.1 x control and partial thromboplastin time (PTT) was 0.9 x control. The chest radiographs revealed bilateral pleural effusion that had not significantly changed from previous examination.

The patient was admitted for increasing respiratory distress and hypoxemia. A ventilation to perfusion ratio (V/Q) scan was interpreted to show a very low probability of pulmonary embolism. Subsequent thoracentesis demonstrated no cancer cells. The patient was anticoagulated without improvement. She developed progressive respiratory failure over the course of the following week, and expired after one month's hospitalization.

gravida 2, para 2, woman who presented with abdominal distention and pain. She was found to have bilateral adnexal masses and a carcinoma involving the endometrium. She was treated and developed recurrences despite very aggressive chemotherapy for ovarian cancer. She finally developed a hypercoagulable state and died within two years of the initial diagnosis.

Let us first review, for the purpose of the medical students, the presentation of a patient with progressive abdominal enlargement. The differential diagnosis should include obstructive intestinal lesions, pregnancy with hydramnios, large ovarian cysts, and ascites. In a woman of reproductive age, the most important diagnosis to consider is the possibility of pregnancy and its related complications. This is unlikely since this patient had a tubal ligation, but it must be considered nonetheless.

This patient presented with bilateral adnexal masses and ascites. Although inflammatory, infectious, or hepatic causes of ascites should always be considered, abdominal neoplasia remains the most likely etiology. Indeed, the combination of abdominal distention, ascites, and adnexal masses makes the probability of an ovarian neoplasm even more likely.

Let us focus for a while on the possible causes of an adnexal mass. An easy mnemonic can help one remember the possible sources of adnexal enlargement. It is the rule of the seven "Fs." The first three involve pelvic but nongynecological structures and include

1. The urinary tract (foley) including lesions arising in the bladder, ureters or kidneys; a pelvic kidney should always be part of the differential diagnosis.
2. The bowel tract (feces) including lesions arising from the rectosigmoid colon, mucosa of the appendix, or inflammatory small-bowel lesion.
3. The retroperitoneal structures (fat) including the neural, lymphatic, vascular, and soft tissue structures.

The last four "Fs" relate to the gynecologic tract and include

1. Pregnancy-related complications (fetus) including that of molar pregnancy and choriocarcinoma.
2. Tumors arising from the uterus (fibroids) including cervical, endometrial, and myometrial lesions.
3. Tumors arising from the (fallopian) tubes including inflammatory and neoplastic lesions.
4. Tumors arising from the (follicle) ovary, which is the most likely source of the bilateral adnexal enlargement in this patient with mucin-secreting carcinoma in the endometrium.

At this stage, one needs to consider the relationship of the mucin-secreting carcinoma in the endometrium to the bilateral adnexal enlargement. The first possibility includes an endometrial carcinoma with metastases to the ovaries. In that respect, it is important to rule out a concomitant inflammatory tubo-ovarian process; this process is unlikely in this patient due to her history of tubal ligation, lack of fever, and her clinical presentation.

The possibility of a functioning ovarian tumor or ovarian tumor with functioning matrix also must be considered. These tumors are notorious for inducing the development of proliferative lesions in the endometrial cavity. The most common of such lesions is a granulosa-theca cell tumor that has been found in association with both endometrial hyperplasia and endometrial cancer in as high as 15–20 percent of the cases.¹ It can be found in both postmenopausal and younger patients, but it is usually unilateral. We are told that the patient presented with bilateral adnexal masses. Furthermore, granulosa-theca cell tumors do not usually present with a rapidly progressive and downhill course. In any event, hormonal secretion from the stimulated ovarian stroma of many types of ovarian tumors also can have an effect on the endometrial lining. Mucinous tumors and Brenner tumors are especially noted for secreting estrogens which stimulate the lining of the uterus, producing endometrial hyperplasia and endometrial cancer.²

Finally, one ought to consider the possibility that a primary uterine lesion could have metastasized to the ovaries. It is not uncommon to have carcinomas arise simultaneously in the endometrial lining of the uterus and on the surface of the ovaries because of the totipotent ability of cells derived

from the Mullerian duct to undergo neoplastic changes at various pelvic sites. Notoriously, these usually do not behave like metastatic disease.³

Perhaps at this stage we could get some help from reviewing the available endometrial biopsy.

Dr. Robert J. Kurman: The patient's vaginal bleeding led her gynecologist to perform an endometrial biopsy. The endometrium, under low magnification, is remarkable for its mixture of both normal endometrial glands and abnormal cells (**Figure 1**). A number of the abnormal cells that are scattered throughout the endometrial stroma have clear, somewhat vacuolated, cytoplasm with eccentric nuclei. These cells, with eccentric nuclei which are displaced to the margin of the cell, are referred to as signet-ring cells. A mucicarmine stain revealed that the clear cytoplasm contained abundant mucin. The biopsy was interpreted as containing mucinous, signet-ring adenocarcinoma cells.

Dr. Genadry: Mucus-secreting uterine cancer has been reported in both the endocervix and in the endometrium, but the latter is rare. In this patient, the presence of normal endometrial glands and the distribution of the mucin-secreting cells in the stroma suggest the possibility of a neoplasm that has invaded the endometrium secondarily, rather than a lesion that has arisen primarily from the endometrium.

There is an adage in gynecology that any patient who presents with an adnexal mass in association with ascites and abdominal distention has to have ovarian neoplasia until proven otherwise. Since we have mucin-secreting carcinoma cells, we must consider the possibility of a mucinous cystadenocarcinoma of the ovary. Mucinous cystadenocarcinoma of the ovary, however, is rarely bilateral. It is possible that in late-stage disease, it could involve both ovaries, but that is not a common presentation.

A type of mucin-secreting carcinoma in the ovary is referred to as Krukenberg tumor. When dealing with Krukenberg tumor, a key question is whether it is primary or secondary. Approximately 20 percent of cases of Krukenberg tumor are primarily ovarian (i.e., no obvious source for primary mucin-secreting adenocarcinoma could be found).⁴ Usually, these patients do better clinically. In view of this particular patient's poor course, an extraovarian primary must exist.

At this point, we could look for radiological clues from her film library.

Dr. George P. Saba: I selected a few films

Figure 1. Endometrial biopsy: The stroma contains small clusters of malignant cells, many of which have signet-ring cell features (arrows). A benign endometrial gland is in the center of the field. (Hematoxylin-eosin, X 320).

from a number of films taken over a two-year course. A plain film of the abdomen early in the illness shows a moderate amount of free fluid and/or ascites in the abdomen. A few months later, an anterior-posterior film (**Figure 2**) from an air-contrast barium enema shows that the cecum is deformed medially, and there is also deformity and spiculation of the sigmoid colon. A lateral film (**Figure 3**) shows barium introduced into the rectum via a tube

placed in the rectum. There is spiculation of the rectosigmoid area with the mass affected both anteriorly and posteriorly in this area, probably due to metastatic disease in the cul-de-sac. The findings are characteristic of a tumor involving the sigmoid and rectum that has gravitated to the pelvic recesses and cul-de-sac and also into the right paracolic gutter to deform the base of the cecum.

A chest film (**Figure 4**) taken a few months before the patient's demise revealed moderate bilateral pleural effusions.

The radiographic findings are compatible with either a primary tumor in the stomach wall with metastatic disease to the remainder of the abdomen or a primary process in the abdomen with metastatic disease to the greater curvature of the stomach.

In the patient's upper gastrointestinal (GI) examination, the stomach is deformed along its greater curvature (**Figure 5**) with a slight increase in the space between the stomach and the air in the transverse colon. This suggests metastatic disease and/or a primary carcinoma of the greater curvature of the stomach.

Dr. Genadry: We are thus dealing with a patient with disseminated disease and bilateral adnexal masses. We know the disseminated disease involves the endometrial lining, but it also seems to involve the entire peritoneal cavity, the stomach, the small bowel, and the rectosigmoid colon. The question remains as to where it is coming from. The positive estrogen and progesterone receptors focus attention on

Figure 2. Anterior-posterior radiograph showing medial deformity of cecum (arrow, left) and spiculation and deformity of the sigmoid colon (arrow, right).

Figure 3. Lateral view of the sigmoid-rectal area showing tumor encasing this portion of the bowel due to involvement in the cul-de-sac (arrow heads).

Figure 4. Chest radiograph showing bilateral pleural effusions.

Figure 5. Radiograph showing deformity of greater curvature of stomach (arrows) and separation of greater curvature of stomach from air in transverse colon due to tumor.

the gynecological system, but what other sites of origin should we consider for this mucin-secreting lesion? Could it be a cancer in the rectosigmoid? Colonoscopy has ruled that possibility out. Could it be a mucocoele of the appendix that occasionally can present as a mucin-secreting metastatic tumor? This cannot be ruled out with 100 percent certainty. The stomach does show linitis plastica changes compatible with an infiltrative process, but none of the interventional-pathologic diagnostic studies that were done were able to prove the presence of any gastric mucosal lesion. In conclusion, I think I will have to say that this patient had Krukenberg tumor. The clinical course of this patient, including lack of response to the ovarian chemotherapeutic regimen suggests metastatic disease to the ovary. The most likely primary site of Krukenberg tumor is the distal stomach. From the radiographs, this seems to be where the bulk of the disease is. Cancer seems to involve the entire covering of the peritoneal cavity. Disease features are consistent with ovarian neoplasia, but disease course and state are so advanced that a primary gastric lesion might explain it.

Dr. Rene R. Genadry's diagnosis
Krukenberg tumor of probable gastric origin.

DISCUSSION OF PATHOLOGY

Dr. Kurman: Dr. Genadry's thinking in this case was very similar to that of the patient's gynecologist. When the patient first presented with bilateral pelvic masses and ascites, the gynecologist believed quite strongly that despite her relative young age, the patient had ovarian cancer. Because of the vaginal bleeding, he did an endometrial biopsy and, with the pathologic diagnosis of a mucin-secreting adenocarcinoma, he, like Dr. Genadry, believed the tumor was metastatic to the ovaries and probably arose from the stomach.

At surgery, there was widespread carcinomatosis involving the entire peritoneal cavity. The ovaries were enlarged but retained the convoluted appearance of normal ovaries. On cut section, the ovaries were homogeneous, gelatinous, and solid, characteristic of Krukenberg tumor. The microscopic findings confirmed the diagnosis of Krukenberg tumor, which is characterized by two cellular components. Some cells look like fibroblasts, but interspersed among them were signet-ring cells (Figure 6). The latter had the same features as those present in the endometrium. It was the spindle-shaped cells that led Dr. Krukenberg, in 1896, to describe this as a primary mucinous fibrosarcoma of the ovary.⁵

On high magnification, the signet-ring cells were shown to contain abundant intracytoplasmic mucin. These cells diffusely infiltrated the ovarian stroma and all of the organs removed at the time of the hysterectomy. Tumor cells were present

Figure 6. Krukenberg tumor of ovary. Many mucin-containing signet-ring cells (arrows) are seen set in a reactive spindle-cell stroma (mucicarmine stain, X 320).

throughout the wall of the fallopian tubes, cervix, endomyometrium, omentum, peritoneal biopsies, bladder, and rectal biopsies. Tumor emboli plugged vascular and lymphatic channels in all these sites—another characteristic feature of this neoplasm.

Most Krukenberg tumors are first recognized at the time of hysterectomy rather than preoperatively. This case was unusual in that there was a clue to the diagnosis of Krukenberg tumor by virtue of the endometrial biopsy. Even with that information, however, it was not possible to make the diagnosis intraoperatively. There was extensive carcinomatous involvement of the peritoneal cavity simulating metastatic ovarian carcinoma. Careful palpation could not identify a mass within the stomach so that the tumor was still considered to be of ovarian origin. A primary Krukenberg tumor was considered, and cytoreductive surgery was performed leaving residual disease measuring less than 1 cm. A course of chemotherapy for ovarian cancer was begun, but there was no response. Ascites, in fact, increased. The possibility of a non-ovarian primary site was considered, and chemotherapy was changed to 5-FU, mitomycin, and actinomycin (used for the treatment of primary gastrointestinal carcinoma). The patient had a good clinical response that unfortunately, was limited to only two months. At that time, there was massive recurrence. Despite multiple endoscopic and gastroscopic examinations with biopsies, no tumor could be identified in the stomach before autopsy.

At the time of autopsy, the patient had extensive tumors involving the abdominal cavity. The stomach displayed the characteristic leather-bottle appearance (so-called linitis plastica)—a shrunken, thickened stomach secondary to diffuse infiltration by tumor cells. There was extensive gastritis and reflux esophagitis secondary to obstruction.

Microscopically, the stomach was diffusely infiltrated by tumor cells which spared the mucosa. There was marked inflammation and ulceration, but no tumor on the mucosal surface. This accounted for the inability of the numerous biopsies to confirm the diagnosis of a gastric carcinoma (Figure 7).

There was involvement of the capsule of the liver, spleen, urinary bladder, and lungs. In the latter, both lymphangitic and parenchymal involvement were evident.

When a gynecologist is confronted by bilateral ovarian masses, the likelihood of metastatic tumor is about one in twenty. It is important to keep that in mind—especially in a young woman—since we usually do not think of metastatic carcinoma in a 45-year-old woman. As Dr. Genadry said, in the reproductive age group, one needs to think first

about problems relating to pregnancy. Adenocarcinoma of the colon is the most common tumor to metastasize to the ovary since the prevalence of gastric carcinoma has decreased in the United States.⁶ The second most common neoplasm is breast carcinoma, although this tumor does not usually present with large ovarian masses. Ovarian involvement by breast carcinoma is typically microscopic. Most cases of breast cancer metastatic to the ovaries are detected at the time of oophorectomy in women who are being hormonally treated.⁷

It should also be emphasized that the diagnosis of Krukenberg tumor should be limited to metastatic carcinoma with a specific histology. As previously noted, Krukenberg originally described the tumor that bears his name as a primary ovarian tumor. This mistake was rectified a few years later by Schlagenhofer who described it as a metastatic carcinoma probably arising in the stomach. Drs. Woodruff and Novak from this institution subsequently established specific criteria for Krukenberg tumor that include the presence of a mucin-secreting signet-ring cell carcinoma and fibroblast-like cells that simulate a sarcoma. The latter are reactive.⁸ In addition to the colon and stomach, primary sites may be in the appendix, the gallbladder, and the urinary bladder.^{9,10}

It is of interest that Krukenberg tumors involve young women. The mean age is 40 years. The reason for the preponderance in young women is that worldwide, most Krukenberg tumors arise from diffuse or signet-ring cell carcinomas of the stomach. Gastric carcinomas can be divided into two categories: the intestinal type and the Krukenberg or signet-ring cell type. It is the signet-ring cell type that occurs in young people, usually women, and it is

Figure 7. Low-power micrograph of stomach with intact mucosa. The submucosa contains a poorly differentiated infiltrating carcinoma (arrow heads). (Hematoxylin-eosin, X 80).

this neoplasm that tends to metastasize to the ovary.⁹ Secondly, the ovaries in young women are more highly vascular than in older women.

A point that was raised by Dr. Genadry is that stimulation of the endometrium leading to abnormal bleeding could result from a functioning ovarian tumor. Sometimes Krukenberg tumors are associated with virilization. This occurs more often during pregnancy.

Finally, Dr. Genadry differentiated a primary Krukenberg tumor from a metastatic Krukenberg tumor. That is a controversial subject because, in order for Krukenberg tumor to qualify as a primary neoplasm, two criteria must be fulfilled. Either the patient must remain alive for five years without evidence of tumor elsewhere following a diagnosis of a Krukenberg tumor of the ovary or, if the patient dies, a complete autopsy must show that no tumor exists elsewhere.⁹ Gastric carcinoma, however, is the most common neoplasm resulting in Krukenberg tumor, and these neoplasms can occasionally be clinically silent for more than five years. Therefore, ovarian neoplasia could still be metastatic without its primary source being appreciated. Sometimes the primary tumor in the stomach may be very small and could be missed even at autopsy.

Dr. Belur S. Bhagavan: Relative to the discussions of primary versus secondary carcinoma (Krukenberg tumors) of the ovary, it is worth noting that initial attempts to determine the origin of the patient's neoplasm included study of sex hormone receptors (i.e., estrogen receptors (ER) and progesterone receptors (PGR) of the tumor tissue). Some questions that may be raised include

- Are the receptor studies of value in determining the primary source of disseminated adenocarcinoma?
- Do cancers with receptor positivity, regardless of the source of origin, behave and respond to treatment as if they were derived from tissues expected to carry such receptors (e.g., breast cancer)?
- How often, in fact, do nonendocrine normal tissue cells express ER and PGR?

Dr. Kurman: Sex hormone receptors have been found in many hormone-dependent tumors such as breast, prostate, and endometrium, and the levels of receptors in these tumors have been used as an indicator for the choice of treatment. The receptors have also been used as an indicator for determining if a metastatic cancer from an unknown primary could be of breast or genital-tract origin. The presence of ER and PGR has been described in a number of apparently non-sex-hormone-dependent tumors, including malignant melanoma, and carcinomas of

the colon, kidney, pancreas, and stomach.¹¹⁻¹⁹ Even normal gastric mucosa and normal gastric tissues have been shown to contain ER and PGR.¹⁸ Thus, receptor protein assays are not likely to be helpful in discriminating between breast and genital-tract tumors and non-sex-hormone-dependent tumors such as gastric carcinomas.

Furthermore, some studies have shown that anti-estrogen (e.g., tamoxifen) has a beneficial effect on survival of patients with gastric carcinoma.^{15,17} Others have shown no beneficial effect with tamoxifen therapy, and, indeed, patients with ER positive gastric cancers have shown a decrease in survival time.¹⁹ Thus, all cancers with receptor positivity regardless of the source of origin may not be expected to behave or respond to treatment in a uniform or predictable manner.

Anatomical diagnosis Krukenberg tumor of gastric origin.

This Clinicopathologic Conference was presented at the Johns Hopkins University School of Medicine on January 3, 1990.

The Medical and Chirurgical Faculty of Maryland wishes to acknowledge the generous support of the following sponsor in making possible the continued preparation of the clinicopathologic conferences:

GLAXO PHARMACEUTICALS

When you can buy
any home, here's
why you'll choose
a Villager.

1. Villager offers the finest homesite locations—in Green Spring Valley communities as well as Worthington Park and the Falls Road corridor. We'll also build your home on your lot... with our plans or yours. **Below market financing.**

3. The opportunity to work one on one with our designers. We'll custom build from your designs or from ours. Our new 1992 designs include the Euro Classic I Award of Excellence recipient from the Homebuilders Association of Maryland and the next generation of our Euro Classic series. Call now. We're building just a few homes for 1992, from \$350,000 to over \$1 million. Phone Sandy Marenberg or Karen Pine for a personal consultation.

2. Breathtaking estate-size home designs, and the reputation for using the very finest materials and craftsmen.

Custom additions and improvements to your existing home.

NEUROSURGEONS: BROADEN YOUR EXPERIENCE.

Your time and talent are valuable. They're valuable to the Army Reserve, too. We'll pay you for a small fraction of your time, not only in money, but with big opportunities and challenges you won't find in civilian practice.

- You'll have flexibility in how and when you participate.
- You'll be offered conferences and continuing education.
- You'll have opportunities for military training in areas like Advanced Trauma Life Support, Parachuting, Flight Medicine and Mountaineering.
- You'll work with top, dedicated professionals.
- You'll have the rank and privileges of an Army officer.

If you want more information about the Army Reserve, or if you would like to talk to an Army Reserve physician, our experienced Army Medical Counselors can assist you. Call collect or write:

Component Society Presidents 1992

Med Chi's component medical societies are the backbone of Maryland's family of medicine. This section of the *Maryland Medical Journal* is dedicated to the leaders of Med Chi's component societies and features biographical information on the component society presidents.

Allegany County
Francisco Reyes, M.D.

Francisco Reyes, M.D. assumed the office of president of the Allegany County Medical Society in January 1992. Born in Nicaragua, Dr. Reyes obtained his professional degree from the Universidad Nacional Autonoma de Nicaragua in 1968. Dr. Reyes fulfilled his internship at the Hospital General de Managua and completed his surgical residency requirements at the Instituto Nacional de Seguridad Social in Nicaragua. From October 1969 to June 1970, Dr. Reyes practiced general medicine in Managua, Nicaragua. In 1970, Dr. Reyes moved to Elyria, Ohio and completed postdoctoral training in a rotating internship at Elyria Memorial Hospital. From July 1971 to June 1975, Dr. Reyes continued his medical training in the United States through a residency in pathology. He served as a fellow in surgical pathology at the University of Maryland Hospital from July 1975 to July 1976. Dr. Reyes currently maintains a pathology practice with Sacred Heart Hospital in Cumberland. ■

Anne Arundel County
Jaime Accinelli, M.D.

Jaime Accinelli, M.D. became president of the Anne Arundel County Medical Society on December 31, 1991. Dr. Accinelli received his medical degree in 1958 from San Marcos University in Lima, Peru. He served his internship and completed a residency in obstetrics and gynecology at Bon Secours Hospital in Baltimore. From 1963 to 1965, he served as acting chief of obstetrics and gynecology at the US Army Hospital in Fort Rucker, Alabama. Dr. Accinelli has served as chairperson of the Department of Gynecology at North Arundel Hospital in Glen Burnie since 1980. ■

Baltimore City
Allan Jensen, M.D.

Allan D. Jensen, M.D. assumed the office of president of the Baltimore City Medical Society on December 7, 1991. Born in Chicago, Illinois, Dr. Jensen received his medical degree from the Johns Hopkins University in 1968. The following year, he completed his internship at Union Memorial Hospital in Baltimore. From 1969 to 1972, Dr. Jensen was a resident at the Wilmer Ophthalmological Institute of the Johns Hopkins Hospital where he participated in a residency exchange program at Khalili Hospital in Shiraz, Iran. From 1972 to 1973, Dr. Jensen served as a cornea fellow for the Massachusetts Eye and Ear Infirmary at the Harvard Medical School and Retina Foundation in Boston, Massachusetts. Upon his return to Baltimore, he became chief resident at the Wilmer Ophthalmological Institute.

During his service as a major in the US Air Force from 1974 to 1976, Dr. Jensen worked in the Ophthalmology Service at the Wilford Hall Medical Center at the Lackland Air Force Base in Texas. Dr. Jensen's past academic appointments include instructor of ophthalmology at the Johns Hopkins University and at the University of Texas in San Antonio. He is currently an assistant professor of ophthalmology at the Johns Hopkins University and chief of ophthalmology at Union Memorial Hospital. He is also a member of the hospital staff at the Johns Hopkins Hospital and the Greater Baltimore Medical Center. ■

Baltimore County
Louis C. Breschi, M.D.

Louis C. Breschi, M.D. was installed as president of the Baltimore County Medical Association in January 1992. A graduate of the University of Maryland School of Medicine, Dr. Breschi completed his rotating internship at the Carswell Air Force Base Hospital in Fort Worth, Texas in 1963. Over the next four years, Dr. Breschi completed his urology residency and the first year of his surgical residency at the University of Maryland Hospital. In 1967, he began working as a urologist at the Wright Patterson Air Force Base in Dayton, Ohio where he later became chief of urology. Dr. Breschi served in Vietnam from 1970 to 1971 as chief of the Urology Service and chief of the Surgical Service at the 483rd US Air Force Hospital in Cam Rahn Bay where he received a bronze star for meritorious service. Upon his return, Dr. Breschi was an instructor in urology and later became an assistant clinical professor in urology at the University of Maryland School of Medicine. From 1972 to 1991, Dr. Breschi was consultant in urology at the James Kernan Hospital. Dr. Breschi currently serves on the medical staffs of Good Samaritan Hospital, St. Joseph Hospital, and Franklin Square Hospital, where he served as president from 1985 to 1987. ■

Calvert County
Joseph S. Fastow M.D., M.P.H.

Joseph S. Fastow M.D., M.P.H. began his second term as president of the Calvert County Medical Society in January 1992. A 1962 graduate of Rutgers University, Dr. Fastow received his medical degree from the Boston University School of Medicine. He fulfilled his internship requirements at the Pennsylvania Hospital in Philadelphia and later went on to become assistant resident in anesthesiology (intensive care medicine) at the George Washington University Hospital in Washington, DC. From 1971 to 1973, Dr. Fastow served in the military, working for the US Public Health Service, the Food and Drug Administration, and the National Heart and Lung Institute. From 1974 to 1977, Dr. Fastow completed a residency and fellowship in emergency medicine at the Johns Hopkins Medical Institutions. In 1977, he earned an M.P.H. from the Johns Hopkins University School of Hygiene and Public Health. He took a position as clinical instructor for the Georgetown University School of Medicine where he later advanced to clinical assistant professor in 1981. A fellow of the American College of Emergency Physicians, Dr. Fastow has held a number of positions including assistant director to the Department of Emergency Medicine at the Doctors' Hospital of Prince George's County and staff physician at the Department of Emergency Medicine at Holy Cross Hospital. He has been director of Emergency Services for Calvert Memorial Hospital in Prince Frederick, Maryland since 1985. ■

Caroline County
Christian E. Jensen, M.D.

Christian E. Jensen, M.D. has served as president of the Caroline County Medical Society for thirteen years. A graduate of Duke University Medical School, Dr. Jensen served his internship at the Naval Hospital in Portsmouth, Virginia and then immediately entered into a private family medicine practice in Denton, Maryland. In 1982, Dr. Jensen accepted a position as medical supervisor for E.I. Dupont De Nemours in Seaford, Delaware. During his eight-year tenure with that company, Dr. Jensen completed a mini-residency in occupational medicine at the University of Cincinnati College of Medicine and graduated from the Naval War College in Newport, Rhode Island. In 1990, he received an M.P.H. from the Medical College of Wisconsin and became president of the board of trustees and corporate medical director of the Delmarva Foundation in Easton, Maryland. He is a fellow of the American College of Family Physicians and has "Master" status in the American College of Occupational and Environmental Medicine. In addition to his active medical practice, Dr. Jensen is the physician for the Caroline County Jail. He is also a captain in the US Naval Reserve, a Desert Storm veteran, and commanding officer of a naval reserve preventive medicine unit. ■

Carroll County

James L. Forsberg, M.D.

James L. Forsberg, M.D. became president of the Carroll County Medical Society on January 1, 1992. A 1983 graduate of the University of Rochester School of Medicine and Dentistry, Dr. Forsberg served his internship and residency at York Hospital in York, Pennsylvania. Dr. Forsberg is currently staff physician at the Carroll Primary Care offices in Westminster and Sykesville. He is also a member of the medical staff at Carroll County General Hospital in Westminster. ■

Cecil County

Henry Farkas M.D., M.P.H., F.A.C.E.P.

Henry Farkas M.D., M.P.H., F.A.C.E.P. began his seventh year as president of the Cecil County Medical Society in January 1992. Dr. Farkas was born in New York City, at-

tended Loyola College, and earned his medical degree from the Johns Hopkins Medical School in 1970. In 1971, he received his M.P.H. from the Johns Hopkins School of Hygiene and Public Health. After completing his internship at the Lancaster General Hospital in Lancaster, Pennsylvania, Dr. Farkas served as general medical officer for the US Public Health Service on a Navajo reservation in Chinle, Arizona. In 1973, he returned to Maryland where he served as an emergency physician for Harford Memorial Hospital. From 1984 to 1990, Dr. Farkas worked as medical director for the Cecil County Detention Center. Dr. Farkas now practices emergency medicine at Union Hospital of Cecil County. He also holds positions as medical director for the Northern Chesapeake Hospice and the Medical Adult Day Care Center of Union Hospital of Cecil County. ■

Charles County

Paul S. Pritchett, M.D.

Paul S. Pritchett, M.D. became president of the Charles County Medical Society on January 1, 1992. After graduating from the Howard University College of Medicine in 1971, Dr. Pritchett completed his internship at the Wilford Hall US Air Force Medical Center in Lackland, Texas. Dr. Pritchett completed his residency in family practice at the Malcom Grow US Air Force Medical Center at Andrews Air Force Base in 1974. After retiring from the military in 1988, Dr. Pritchett entered into a private practice in LaPlata, Maryland. In addition to his practice, he is also medical director for the Charles County Nursing Home in LaPlata. ■

Frederick County

Henry P. Laughlin M.D., Sc.D., Sc.S.D.

Henry P. Laughlin M.D., Sc.D., Sc.S.D. became president of the Frederick County Medical Society on January 1, 1991 and is the first physician to have held the office of president in both Frederick and Montgomery counties. A native of Hagerstown, Dr. Laughlin attended the Johns Hopkins University and earned a B.S. from Ursinus College in 1938. He obtained his medical degree from the Temple University School of Medicine in 1941. Following graduation, he served over seven years as a US Navy physician and surgeon during World War II in the American, Caribbean, African-European, and Asiatic theaters of operation, as well as in the United States. Following the war, Dr. Laughlin maintained a private practice as a specialist in psychiatry for forty years in the Chevy Chase, Bethesda, and Frederick areas. During that time, he was a fellow of the AMA and the Washington Medical and Surgical Society. He was a faculty member at the George Washington University Medical School for thirty-five years, the last six with the rank of clinical professor. From 1974 to 1989, Dr. Laughlin served as distinguished visiting professor at the University of Louisville School of Medicine. Dr. Laughlin is the recipient of numerous awards and holds an honorary Sc.D. degree from Ursinus College and an Sc.S.D. degree from the University of Louisville. Dr. Laughlin currently serves as associate editor for the *Maryland Medical Journal*. He is also an emeritus staff member of Suburban Hospital in Bethesda and Frederick Memorial Hospital. ■

Garrett County
John L. Pocaro, M.D.

John L. Pocaro, M.D. began his third term as president of the Garrett County Medical Society in January 1992. Born in New York City, Dr. Pocaro graduated from the University of Medicine and Dentistry of New Jersey (UMDNJ) in Newark where he began his residency in general surgery in 1978. He moved on to become a resident in ear, nose, throat, head, and neck surgery at the Columbia University College of Physicians and Surgeons in New York. Dr. Pocaro returned to UMDNJ to complete his residency training in general surgery and later became a fellow in vascular surgery in 1982. A fellow of the American College of Surgeons, Dr. Pocaro was appointed as clinical assistant professor of surgery for the West Virginia University. He is currently chief of staff and chief of the Anesthesia Department for the Garrett County Memorial Hospital. ■

Harford County
Peter Kang, M.D.

Peter Kang, M.D. became president of the Harford County Medical Society on January 1, 1992. Dr. Kang graduated from the Seoul National University School of Medicine in Korea in 1962. From 1967 to 1970, Dr. Kang completed his residency in anesthesiology at the Johns Hopkins Hospital in Baltimore. For the next four years, Dr. Kang was an instructor of anesthesiology at the Johns Hopkins University School of Medicine. A fellow of the American College of Anesthesia, Dr. Kang currently serves as chairperson of the Department of Anesthesia for Harford Memorial Hospital. ■

Howard County
Melvin S. Rapelyea, M.D.

Melvin S. Rapelyea, M.D. became president of the Howard County Medical Society in January 1992. Born in Queens, New York, Dr. Rapelyea received his medical degree from the University of Rochester School of Medicine. From 1976 to 1978, he completed his surgical internship and first year of surgical residency at the North Shore University Hospital at the Teaching Affiliate of Cornell Medical School in Manhasset, New York. Following his surgical training, Dr. Rapelyea served as a radiology resident at the North Shore University Hospital. In 1981, Dr. Rapelyea moved to Maryland and worked as a contract radiologist for a number of medical groups including Flynn Radiology Group, Computerized Radiology Associates, and Prince George's Radiology Group and served as a contract radiologist for the Medical Dispensary at General Electric. Dr. Rapelyea is currently assistant chairperson of radiology at Howard Community Hospital where he is also on several hospital committees and is a partner with Diagnostic Radiology Associates in Columbia, Maryland. ■

Kent County.

Douglas M. Cummings M.D., F.A.C.S.

Douglas M. Cummings, M.D., F.A.C.S. has been president of the Kent County Medical Society since January 1991. After graduating from the US Military Academy at West Point, New York, Dr. Cummings served in Vietnam for six years before entering medical school. He graduated from the University of Arkansas School of Medicine in Little Rock in 1976. He completed his internship and residency in urology at the Walter Reed Army Medical Center in Washington, DC. He retired from the military in 1988 after six years of solo practice at the Fort Meade Army Hospital and established a private practice in Chestertown. A fellow of the American College of Surgeons, Dr. Cummings currently resides in Betterton, Maryland. ■

Montgomery County

**Carol W. Garvey, M.D., M.P.H.,
F.A.A.F.P., F.A.C.P.M.**

Carol W. Garvey, M.D. M.P.H., F.A.A.F.P., F.A.C.P.M. became president of the Montgomery County Medical Society on April 21, 1992. After receiving a medical degree from the Columbia University College of Physicians and Surgeons in 1969, Dr. Garvey served her internship and residency at the Washington Hospital Center in Washington, DC. In 1973, Dr. Garvey became a fellow in the Harvard Family Health Care Program at the Children's Medical Center and Harvard Medical School. In 1975, she received an M.P.H. from the Harvard School of Public Health. While in Massachusetts, Dr. Garvey was an instructor in the Department of Medicine at the Boston University School of Medicine. She also worked as a physician for the Boston Family Planning Project and as a consultant for the Massachusetts Federal/State Family Planning Committee. In 1976, Dr. Garvey moved to Maryland where she worked as a medical officer for the Bureau of Community Health Services in the US Department of Health and Human Services in Rockville. In addition to a private practice in family medicine, Dr. Garvey is a clinical assistant professor at Georgetown University School of Medicine and is on the medical staff at Suburban Hospital. ■

Prince George's County

Brian S. Bayly, M.D.

Brian S. Bayly, M.D. became president of the Prince George's County Medical Society on January 1, 1992. A graduate of the Georgetown University School of Medicine, Dr. Bayly fulfilled his internship in surgery at the University of New Mexico and at the Georgetown University Affiliated Hospitals in Washington, DC. In 1979, Dr. Bayly received a fellowship in peripheral vascular surgery at the Washington Vascular Clinic in Cheverly, Maryland. He completed his surgical residency training in 1979 at the Georgetown Affiliated Hospitals in Washington, DC. Dr. Bayly currently holds privileges at Doctors Community Hospital, Greater Laurel/Beltsville Hospital, Leland Memorial Hospital, and Prince George's Hospital Center. He holds courtesy privileges at Holy Cross Hospital, Washington Adventist Hospital, and Washington Hospital Center. ■

Queen Anne's County
John R. Smith, Jr., M.D.

John R. Smith, Jr., M.D. began his fifth term as president of Queen Anne's County Medical Society in January 1992. A graduate of the University of Maryland School of Medicine, Dr. Smith served his internship and first year of residency at the Union Memorial Hospital from 1947 to 1949. Dr. Smith completed his residency at the Hospital for Women of Maryland. In 1950, he was a fellow in internal medicine at Johns Hopkins Hospital. The following year, while serving as a captain in the US Air Force, he became chief of medicine at the Mitchell Air Force Base in Garden City Long Island, New York. From 1954 to 1960, Dr. Smith maintained a private practice in New York City. During this period, Dr. Smith was also an instructor in medicine at Cornell Medical School and an attending physician at the New York Hospital for Cornell Medical School. Since 1960, Dr. Smith has practiced internal medicine in Centreville, Maryland. ■

St. Mary's County
James C. Boyd, M.D. (photo not available)

James C. Boyd, M.D. began his second term as president of St. Mary's County Medical Society in January 1992. Dr. Boyd received his medical degree from George Washington School of Medicine in 1974. From 1974 to 1977, he served his internship and residency at the University of Maryland Hospital. Dr. Boyd currently maintains a private practice in internal medicine in Leonardtown, Maryland. ■

Talbot County
David A. Stout, M.D.

David A. Stout, M.D. became president of the Talbot County Medical Society in July 1991. A graduate of Loma Linda University Medical School in Loma Linda, California, Dr. Stout served his internship and residency in pathology at the Yale-New Haven Hospital in New Haven, Connecticut. From July 1966 to July 1968, he served in the military as a surgeon for the US Public Health Service. In 1968, he began a two-year residency in clinical pathology at the National Institutes of Health in Bethesda. From 1970 to 1975, Dr. Stout was attending pathologist at Kent and Queen Anne's Hospital and at LeLand Memorial Hospital. He is currently a consulting pathologist at Dorchester General Hospital and attending pathologist at Memorial Hospital in Easton, Maryland. ■

Wicomico County
Ignatius Loyola Di Nardo, M.D.

Ignatius Loyola Di Nardo, M.D. assumed the office of president of Wicomico County Medical Society on January 1, 1992. Dr. Di Nardo graduated from the Georgetown University School of Medicine in 1983. He served an internship at Baltimore City Hospitals and completed his residency at the Francis Scott Key Medical Center. In 1983, Dr. Di Nardo began a three-year fellowship in internal medicine with the Johns Hopkins University School of Medicine. From June 1985 to June 1986, Dr. Di Nardo worked as an emergency room physician for the Wyman Park Health System in Baltimore. Dr. Di Nardo is currently the medical director of Somerset Medical Center and a staff physician for the Peninsula Regional Medical Center. ■

Worcester County

Stephen F. Waters, M.D. (photo not available)

Stephen F. Waters, M.D. began his third term as president of the Worcester County Medical Society in January 1992. Born in Gettysburg, Pennsylvania, Dr. Waters received his B.A. in biology from the Catholic University of America in Washington, DC. He studied at the Catholic University of America and the University of Maryland before entering the Georgetown University School of Medicine in 1976. After receiving his M.D. in 1980, Dr. Waters served a family practice residency at Franklin Square Hospital until 1983. Dr. Waters currently maintains a private practice in family medicine and ambulatory medicine at the Ocean City Medical Center. ■

Resident Component Society
Eric Lon Shampaine, M.D.

Eric Lon Shampaine, M.D. became president of the Resident Component Society of the Medical and Chirurgical Faculty of Maryland in July 1991. Graduating with distinction in research from the University of Michigan Medical School in 1988, Dr. Shampaine served his internship in the Transitional Program at St. Joseph Mercy Hospital in Ann Arbor, Michigan. In 1989, he received the Intern of the Year Award "in recognition of outstanding duties performed" and began his residency in anesthesiology at the Johns Hopkins Hospital. In 1992, Dr. Shampaine completed a fellowship in cardiac anesthesia at the Johns Hopkins Hospital. Specializing in cardiac anesthesia, Dr. Shampaine will begin a faculty appointment as an attending physician in anesthesiology at The Johns Hopkins Hospital in July 1992. ■

Student Component Society
W. David Sullivan

W. David Sullivan, a fourth-year medical student at the Johns Hopkins University, is currently serving as president of the Medical Student Component Society of the Medical and Chirurgical Faculty of Maryland. Born in Mississippi, Mr. Sullivan graduated from the University of Southern Mississippi in 1987. He spent his first postgraduate year studying at the Federal Institute of Technology in Zurich, Switzerland as a Fulbright scholar. Mr. Sullivan currently serves as an alternate delegate for Med Chi's Delegation to the American Medical Association (AMA) and attended the AMA's 1991 annual and interim meetings. ■

Med Chi would also like to recognize those component presidents whose biographical information was not available at press time:

Dorchester County
James F. McCarter, M.D.

Somerset County
James A. Sterling, M.D.

Washington County
John G. Newby, M.D. ■

Making Life Better For Your Terminally Ill Patients

Your patient has been diagnosed with a terminal illness and wishes to spend the rest of his life at home. During this time, you want him to be well cared for and comfortable. With the **Bon Secours Hospice Program**, you can provide your patient with the best, most comprehensive care available.

The **Bon Secours Hospice Program** emphasizes the family and patient as the unit of care and offers:

- On call services for medical emergencies • Continuous care for medical crises
- An interdisciplinary team approach that includes Skilled Nurses, Home Health Aides, Medical Social Workers, Pastoral counseling, and Volunteers
- Respite care • Pharmaceuticals (95% covered) • Medical Equipment
- Experience in pain management • Bereavement follow-up for the family

For more information on this beneficial program call 837-8500.

Bon Secours Home Health / Hospice

Bon Secours Hospice Program is a licensed and certified Hospice with a tradition of care since 1881

Board of Physician Quality Assurance Actions

**In the matter of
S. Edward Bradford, P.A.
before the
Maryland Board of
Physician Quality Assurance
Consent order**

Based on information received by the State Board of Physician Quality Assurance (the board), pursuant to its authority under *Md. Health Occ. Code Ann.* §15-314, charged S. Edward Bradford (the respondent), physician assistant (P.A.), under §15-314(2), (4), and (5) (1991 Repl. Vol.), in Charges Under the Medical Practice Act, incorporated herein as Exhibit A.

The pertinent provision of §15-314 provide

Subject to the hearing provisions of §15-315 of this subtitle, the board, on the affirmative vote of a majority of its members then serving, may reprimand any certificate holder or suspend or revoke a certificate if the certificate holder

- (2) Fraudulently or deceptively uses a certificate;
- (4) Performs delegated medical acts beyond the scope of the certificate not within a job description approved by the board; and
- (5) Performs delegated medical acts without the supervision of a physician.

Respondent voluntarily surrendered his physician assistant certificate to the executive committee of the board on March 13, 1991 and proffered that he would not practice as a physician assistant pending resolution of the charges against him provided that the board would accept respondent's surrender in lieu of issuing an order for summary suspension.

On April 10, 1991, a settlement conference was held. Present were John F. Strahan, M.D., chief settlement officer; Frank A. Gunther, Jr.; Peter E. Dans, M.D.; and Lawrence A. Jones, M.D. Also present were respondent; Bernard A. Cook, counsel for respondent; Debra G. Woodruff, assistant attorney general; Charles F. Cichon, board investigator; and Barbara Hull Foster, board counsel. The settlement conference recommended that this case be resolved by entering into a consent order. The board, at its meeting on May 8, 1991, considered the settlement conference's recommendation and voted to accept this consent order.

Findings of fact

1. On February 20, 1985, the Board of Medical Examiners (BME) registered respondent as a certified physician assistant, Certification Number C00642.
2. On March 11, 1988, respondent submitted a physician assistant application for approval of job description to the BME. In the application, respondent indicated that he would be employed as a physician assistant exclusively at the Howard Medical Walk-in Clinic (the Howard Clinic), 8455 Baltimore National Pike, Ellicott City, Maryland. The named supervising physician was Chong C. Han,

M.D., and the alternate supervising physician was Donald J. Hayes, M.D. The job description stated that either physician would supervise respondent 70 to 80 percent of the time.

3. On March 17, 1988, BME approved respondent's job description at the Howard Clinic.
4. Sometime after March 17, 1988, Dr. Han began signing his name on blank prescriptions for respondent's use at the Howard Clinic.
5. On several occasions since April 1988, respondent removed boils or cysts from patients without physician supervision.
6. On several occasions since April 1988, respondent dispensed samples of prescription drugs to patients at the Howard Clinic.
7. In May 1989, Dr. Hayes terminated his relationship as respondent's alternative supervising physician.
8. From August 16, 1990 to sometime in October 1990, Dr. Han did not work at the Howard Clinic. Respondent did not notify the board about Dr. Han's absence. Respondent continued to treat patients at the Howard Clinic without physician supervision, in spite of the job description requirement that a named physician would supervise respondent 70 to 80 percent of the time.
9. Dr. Han returned to work at the Howard Clinic sometime in October 1990 on a part-time basis. Respondent continued to treat patients at the clinic when Dr. Han was not present and without physician supervision.
10. On or about February 12, 1990, respondent began treating patients and prescribing medications using prescriptions presigned by Dr. Han for patients who sought care at the Patapsco Medical Walk-in Clinic (the Patapsco Clinic), 3438 Annapolis Road, Baltimore, Maryland 21227.
11. Respondent has not submitted to the board an application for approval of job description listing the Patapsco Clinic as the facility where respondent intends to practice as a physician assistant.
12. Respondent was employed at the Patapsco Clinic as a physician assistant without a supervising physician.
13. On February 28, 1991, the board subpoenaed twenty-six medical records from the Patapsco Clinic. A review of the records revealed, that in the absence of physician supervision, respondent examined patients and prescribed medication on prescription forms presigned by Dr. Han in the following instances:

Date	Patient	DOB	Prescription
2/12/90	A	9/26/17	Phenobarbital Zaroxolyn Ampicillin Motrin
6/18/90	B	10/29/56	Kenolog Cream Benadryl
6/20/90	C	9/26/64	Motrin
7/20/90	A	9/26/17	Doxycycline Phenobarbital Zaroxolyn

Board of Physician Quality Assurance Actions

12/17/90	A	7/18/87	Tenormin Phenobarbital
1/28/91	D	7/18/87	Phenergan w/Codeine Alupent Syrup
1/28/91	E	7/12/50	Bactrim DS Pyridium
1/28/91	F	11/18/79	Augmentin Humibid LA
1/28/91	G	10/11/56	Pyridium
1/28/91	H	8/25/60	Cytocort Cream
1/28/91	I	11/1/66	Amoxicillin Humibid LA
1/28/91	J	2/3/80	Phenergan Expectorant EES
1/30/91	K	12/5/77	Humibid LA Amoxicillin
1/30/91	L	4/17/63	Entex Amoxicillin
2/4/91	H	8/25/60	Lotrim Cream
2/9/91	H	8/25/60	Atarax
2/11/91	H	8/25/60	Mycostatin

Conclusions of law

Based upon the findings of fact, the board concludes, as a matter of law, that respondent fraudulently or deceptively used a physician assistant certificate; performed delegated medical acts beyond the scope of the certificate not within a job description approved by the board; and performed delegated medical acts without the supervision of a physician. (See *Md. Health Occ. Code Ann.* §15-314(2), (4) and (5) (1991 Repl. Vol.).

Order

Based upon the foregoing, it is this 19th day of November 1991, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED, that respondent's certification as a physician assistant is hereby **SUSPENDED** for a period of at least one year; and it is further

ORDERED, that one year from the date of this order, respondent may petition the board, through the settlement conference, for reinstatement of respondent's certification to practice as a physician assistant. At that time, respondent must submit evidence to show

1. how the Patapsco and Howard Medical Walk-in Clinics are being operated;
2. written attestation from any health professional working at the Patapsco and Howard Medical walk-in clinics that respondent did not work in the capacity as a health care provider during the previous year; and
3. evidence of continuing education courses taken during the year.

The board retains the authority to determine whether to grant or deny reinstatement of respondent's certificate.

NOTHING IN THIS ORDER SHALL BE CONSTRUED AS A PROMISE BY THE BOARD TO GRANT RESPONDENT'S APPLICATION FOR APPROVAL OF JOB DESCRIPTION; and it is further

ORDERED, if the board grants reinstatement of respondent's certificate, the board may place respondent on probation subject to the following probationary conditions and other conditions as the board deems necessary:

1. Respondent has signed releases, incorporated herein as Exhibit B, permitting the board to obtain information about respondent from any other relevant individuals or organizations as requested by the board.
2. Respondent must submit an application for approval of job description to the board as specified in HO §15-302.
3. Respondent may **ONLY** practice under the supervision of a licensed physician, approved by the board, on site 100 percent of the time.
4. Respondent's supervising physician must submit quarterly reports to the board about respondent's performance as a physician assistant, to be dated beginning August 15, 1992, November 15, 1992, February 15, 1993, and May 15, 1993.
5. After practicing under the supervision of a physician as specified in paragraph #3 above for a period of one year, respondent may petition the board, through the settlement conference, for a termination of all probationary conditions; and be it further

ORDERED, that respondent will be responsible for all costs incurred under this consent order; and be it further

ORDERED, that this consent order is considered a public document pursuant to *Md. State Gov't Code Ann.* §10-611, *et seq.* (1990 Cum. Supp.).

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Consent

By signing this consent, I hereby accept and agree to be bound by the foregoing consent order and its conditions and restrictions, consisting of nine pages.

1. By signing this consent, I hereby submit to this order and its conditions.
2. I acknowledge the validity of this order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this order.
3. I acknowledge that by consent to this order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my certificate to practice as a physician assistant in the state of Maryland.

I, S. Edward Bradford, P.A., have read this consent order and have carefully reviewed each and every part with my

Board of Physician Quality Assurance Actions

attorney, Patrick Malloy, Esquire. I understand it and voluntarily agree to it.

I sign and consent to this order after having an opportunity to consult with counsel and with full understanding of the meaning and terms of the order.

S. EDWARD BRADFORD, P.A.

Exhibit A

In the matter of
S. Edward Bradford, P.A.
before the
Maryland Board of
Physician Quality Assurance

Charges under the Maryland Medical Practice Act

Based on information received by the State Board of Physician Quality Assurance (the board), the board hereby charges S. Edward Bradford, P.A. (the respondent), under the Maryland Medical Practice Act (the act), *Md. Health Occ. Code Ann.* §15-314(2), (4), and (5) (1991 Repl. Vol.).

The pertinent provisions of §15-314 provide

Subject to the hearing provisions of §15-315 of this subtitle, the board, on the affirmative vote of a majority of its members then serving, may reprimand any certificate holder or suspend or revoke a certificate if the certificate holder

- (2) Fraudulently or deceptively uses a certificate;
- (4) Performs delegated medical acts beyond the scope of the certificate not within a job description approved by the board; and
- (5) Performs delegated medical acts without the supervision of a physician.

Allegations of fact.

The board bases its charges on the following facts that the board has cause to believe are true:

1. On February 20, 1985, the Board of Medical Examiners registered respondent as a certified physician assistant, Certification Number C00642.
2. On March 11, 1988, respondent submitted a physician assistant application for approval of job description to the Board of Medical Examiners. In the application, respondent indicated that he would be employed as a physician assistant exclusively at the Howard Medical Walk-in Clinic (the Howard Clinic), 8455 Baltimore National Pike, Ellicott City, Maryland. The named supervising physician was Chong C. Han, M.D., and the alternate supervising physician was Donald J. Hayes, M.D.
3. On March 17, 1988, the Board of Medical Examiners approved respondent's job description at the Howard Clinic.
4. Sometime after March 17, 1988, Dr. Han began signing his name on blank prescriptions for respondent's use at the Howard Clinic.
5. On several occasions since April 1988, respondent has been observed removing boils or cysts from patients without physician supervision.
6. On several occasions since April 1988, respondent has been observed treating patients at the Howard Clinic without physician supervision.
7. On several occasions since April 1988, respondent has been observed dispensing samples of prescription drugs to patients at the Howard Clinic.

8. In May 1989, Dr. Hayes terminated his relationship as respondent's alternate supervising physician.
9. From August 16, 1990 to sometime in October 1990, Dr. Han did not work at the Howard Clinic. Respondent did not notify the board about Dr. Han's absence. Respondent continued to treat patients at the Howard Clinic without physician supervision.
10. Dr. Han returned to work at the Howard Clinic sometime in October 1990 on a part-time basis. Although Dr. Han currently works at the Howard Clinic three days a week, the clinic is open six days a week. Respondent treats patients at the clinic when Dr. Han is not present and without physician supervision.
11. On or about February 12, 1990, respondent began treating patients and prescribing medications using prescriptions prescribed by Dr. Han for patients who sought care at the Patapsco Medical Walk-in Clinic (the Patapsco Clinic), 3438 Annapolis Road, Baltimore, Maryland 21227.
12. Respondent has not submitted to the board an application for approval of job description listing the Patapsco Clinic as the facility where respondent intends to practice as a physician assistant.
13. Respondent is currently employed at the Patapsco Clinic as a physician assistant without a supervising physician.
14. On February 28, 1991, the board subpoenaed twenty-six medical records from the Patapsco Clinic. A review of the records reveals that in the absence of physician supervision, respondent examined patients and prescribed medication on prescription forms prescribed by Dr. Han in the following instances:

Date	Patient	DOB	Drug prescribed
2/12/90	A	9/26/17	Phenobarbital Zaroxolyn Ampicillin Motrin
6/18/90	B	10/29/56	Kenolog Cream
6/20/90	C	9/26/64	Motrin
7/20/90	A	9/26/17	Doxycycline Phenobarbital Zaroxolyn
12/17/90	A	9/26/17	Tenormin Phenobarbital
1/28/91	D	7/18/87	Phenergan w/ codeine Alupent Syrup
1/28/81	E	7/12/50	Bactrim DS Pyridium
1/28/91	F	11/18/79	Augmentin Humibid LA
1/28/91	G	10/11/56	Pyridium
1/28/91	H	8/25/60	Cytocort Cream
1/28/91	I	11/1/66	Amoxicillin Humibid LA
1/28/91	J	2/3/80	Phenergan expectorant EES
1/30/91	K	12/5/77	Humibid LA Amoxicillin
1/30/91	L	4/17/63	Entex Amoxicillin
2/4/91	H	8/25/60	Lotrim cream
2/9/91	H	8/25/60	Atarax
2/11/91	H	8/25/60	Mycostatin

Board of Physician Quality Assurance Actions

Notice of possible sanctions

If, after a hearing, the board finds, by a preponderance of the evidence, that the respondent committed the prohibited acts as charged under *Md. Health Occ. Code Ann.* §15-314(2), (4), and (5) (1991 Repl. Vol.), the board may take disciplinary action against the respondent's certification, including revocation, suspension, or reprimand.

Notice of hearing, settlement conference, and prehearing conference

A hearing in this matter has been scheduled for April 16, 1991 at 9:00 a.m. in the Office of Administrative Hearings, Administrative Law Building, Greenspring Station, 10753 Falls Road, Lutherville, Maryland 21093.

In addition, a settlement conference in this matter has been scheduled for April 10, 1991 at 2:00 p.m. in the board's office, 4201 Patterson Avenue, Baltimore, Maryland 21215; and a prehearing conference in this matter has been scheduled for April 11, 1991 at 9:00 a.m. in the Office of Administrative Hearings, Administrative Law Building, Greenspring Station, 10753 Falls Road, Lutherville, Maryland 21093. The nature and purpose of the settlement conference and prehearing conference is described in the letter to the respondent.

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Exhibit B

In the matter of
S. Edward Bradford, P.A.
before the
Maryland Board of
Physician Quality Assurance

Summons and notice of charges and hearing

YOU ARE HEREBY SUMMONED to appear at a hearing before an administrative law judge. The administrative law judge refers proposed findings of fact, conclusions of law, and recommendations to the State Board of Physician Quality Assurance (the board) to determine whether you have committed the prohibited acts described in [Exhibit A] entitled "Charges under the Maryland Medical Practice Act" and what sanctions, if any, are appropriate.

The hearing is scheduled for April 16, 1991 at 9:00 a.m. in the Office of Administrative Hearings, Administrative Law Building, Greenspring Station, 10753 Falls Road, Lutherville, Maryland 21093.

This hearing is held under the authority of *Md. Health Occ. Code Ann.* Section 14-405 (1991 Replacement Volume) and *Md. State Gov't Code Ann.* Section 10-205 (1984).

If you do not appear as required by this summons, the administrative law judge may hear this matter in your absence and refer this matter to the board for disposition as provided under Section 14-405 of the Health Occupations Article.

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

In the matter of
Charlie Davis, P.A.
before the
Maryland Board of
Physician Quality Assurance

Consent order

Based on information received by the State Board of Physician Quality Assurance (the board), the board, pursuant to its authority under *Md. Health Occ. Code Ann.* §15-314, charged Charlie Davis (the respondent), physician assistant (P.A.), under *Md. Health Occ. Code Ann.* §§15-314(2), (4), and (5) (1991 Repl. Vol.), on June 24, 1991.

The pertinent provisions of §15-314 provide

Subject to the hearing provisions of §15-315 of this subtitle, the board, on the affirmative vote of a majority of its members then serving, may reprimand any certificate holder or suspend or revoke a certificate if the certificate holder

- (2) Fraudulently or deceptively uses a certificate;
- (4) Performs delegated medical acts beyond the scope of the certificate not within a job description approved by the board; and
- (5) Performs delegated medical acts without the supervision of a physician.

On July 10, 1991, a settlement conference was held. Present were John F. Strahan, M.D., chief settlement officer; Frank A. Gunther, Jr.; and J. Andrew Sumner, M.D. Also present were respondent; Jerome M. Levine, counsel for respondent; Debra G. Woodruff, assistant attorney general; Sylvia J. Williams, legal assistant; Margaret T. Anzalone, deputy executive director; Charles F. Cichon, board investigator; Barbara Hull Foster, board counsel; Steven J. Poliakoff, staff attorney; and Laurie Slosberg, law clerk. The settlement conference recommended that this case be resolved by entering into a consent order. The board, at its meeting on September 25, 1991, considered the settlement conference's recommendation and voted to accept this consent order.

Findings of fact

1. On January 1, 1984, the Board of Medical Examiners (BME) registered respondent as a certified physician assistant.
2. On July 28, 1989, respondent submitted a physician assistant application for approval of job description to the board. In the application, respondent indicated that he would be employed as a physician assistant, on a part-time basis, at Howard Medical Walk-in Clinic (the Howard Clinic), 8455 Baltimore National Pike, Ellicott City, Maryland. The named supervising physician was Chong C. Han, M.D. The job description stated that Dr. Han would supervise respondent 80 percent of the time.
3. On August 16, 1989, the board approved respondent's job description at the Howard Clinic.

Board of Physician Quality Assurance Actions

4. On or about February 12, 1990, respondent began treating patients at the Patapsco Medical Walk-on Clinic (the Patapsco Clinic), 3438 Annapolis Road, Baltimore, Maryland 21227. Respondent did not submit a physician assistant application for approval of job description listing the Patapsco Clinic as a facility where respondent intended to practice as a physician assistant to the board. It is the responsibility of the physician assistant to insure that the application for approval of job description is submitted to the board.
5. Respondent was employed at the Patapsco Clinic as a physician assistant without a supervising physician.
6. While working as a physician assistant, respondent prescribed medications using prescriptions that were pre-signed by Dr. Han.
7. A physician may not delegate the duty of independently prescribing or dispensing drugs to a physician assistant. See COMAR 10.32.03.06(B).

Conclusions of law

Based upon the above findings of fact, the board concludes as a matter of law, that respondent fraudulently or deceptively used a physician assistant certificate; performed delegated medical acts beyond the scope of the certificate not within a job description approved by the board; and performed delegated medical acts without the supervision of a physician. (See *Md. Medical Occ. Code Ann.* §15-314(2), (4), and (5) (1991 Repl. Vol.).

Order

Based upon the foregoing, it is this 25th day of September 1991, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED, that respondent is hereby REPRIMANDED; and it is further

ORDERED, that respondent may practice ONLY under the supervision of a licensed physician, approved by the board; and be it further

ORDERED, that respondent may NOT prescribe medications; and be it further

ORDERED, that respondent may NOT use prescriptions that are pre-signed; and be it further

ORDERED, that respondent will cooperate with the state, through its administrative prosecutors, in any action that involves the Howard and Patapsco clinics; and be it further

ORDERED, that this consent order is considered a public document pursuant to *Md. State Gov't. Code Ann.* §10-611, et seq. (1990 Cum. Supp.).

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Consent

By signing this consent, I hereby accept and agree to be bound by the foregoing consent order and its conditions and restrictions, consisting of nine (5) pages.

1. By signing this consent, I hereby submit to this order and its conditions.
2. I acknowledge the validity of this order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this order.
3. I acknowledge that by consent to this order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my certificate of practice as a physician assistant in the state of Maryland.

I, Charlie Davis, P.A., have read this consent order and have carefully reviewed each and every part with my attorney, Jerome M. Levine, Esquire. I understand it and voluntarily agree to it.

I sign and consent to this order after having an opportunity to consult with counsel and with full understanding of the meaning and terms of the order.

CHARLIE DAVIS, P.A.

In the matter of
Chong C. Han, M.D.
before the
Maryland Board of
Physician Quality Assurance
Consent order

Based on information received by the State Board of Physician Quality Assurance (the board), the board, pursuant to its authority under *Md. Health Occ. Code Ann.* §14-404, charged Chong C. Han, M.D. (the respondent), under the Maryland Medical Practice Act (the act), *Md. Health Occ. Code Ann.* §§14-404(a)(2) and (18) (1991 Repl. Vol.) on June 25, 1991.

The pertinent provisions of the act provide the following:

- (a) Subject to the hearing provisions of §14-405 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:
 - (2) Fraudulently or deceptively uses a license;
 - (18) Practices medicine with an unauthorized person or aids an unauthorized person in the practice of medicine.

On July 10, 1991, a settlement conference was held. Present were John F. Strahan, M.D., chief settlement officer; Frank A. Gunther, Jr.; and J. Andrew Sumner, M.D. Also present were respondent, Daniel H. Scherr, counsel for respondent; Debra G. Woodruff, assistant attorney general;

Board of Physician Quality Assurance Actions

Sylvia J. Williams, legal assistant; Margaret T. Anzalone, deputy executive director; Charles F. Cichon, board investigator; Barbara Hull Foster, board counsel; Steven J. Poliakoff, staff attorney; and Laurie Slosberg, law clerk. The settlement conference recommended that this case be resolved by entering into a consent order. The board, at its meeting on September 25, 1991, considered the settlement conference's recommendation and voted to accept this consent order.

Findings of fact

1. At all times relevant to these charges, respondent was and is licensed to practice medicine in the state of Maryland.
2. On or about March 17, 1988, respondent was hired to work as a physician at the Howard Medical Walk-In Clinic (the Howard Clinic), 8455 Baltimore National Pike, Ellicott City, Maryland.
3. On March 18, 1988, the Board of Medical Examiners approved S. Edward Bradford's application for approval of job description to work as a physician assistant at the Howard Clinic under the supervision of respondent and Donald J. Hayes, M.D.
4. On April 16, 1989, the Board of Physician Quality Assurance approved Charlie Davis' application for approval of job description to work as a physician assistant at the Howard Clinic under respondent's supervision.
5. While employed at the Howard Clinic, respondent signed his name on blank prescriptions for the physician assistants to use. A physician may not delegate the duty of independently prescribing or dispensing drugs to a physician assistant. See COMAR 10.32.03.06(B).
6. Respondent had surgery in August 1990 and did not work at the Howard Clinic from August 16, 1990 to sometime in October 1990. Respondent did not notify the board about his absence. During that time, the physician assistant worked at the Howard Clinic without supervision.
7. On July 9, 1991, respondent terminated his employment at the Howard Clinic.
8. Respondent has cooperated fully with the board, the investigators, and the attorney general's office in the investigation of this matter.
9. Since 1985, respondent has been employed, on a part-time basis, by the Veterans Administration Regional Office (VA) in Baltimore, Maryland as a rating board medical specialist, a physician who performs medical chart reviews.
10. By presigning the prescription blanks with his signature, respondent enabled unauthorized persons to practice medicine.

Conclusions of law

Based upon the above findings of fact, the board concludes as a matter of law, that respondent aided unauthorized persons in the practice of medicine. See HO §14-404(a)(18).

Pursuant to HO §14-406(b), the board finds that there are no grounds for action under HO §14-404(a)(2) and hereby dismisses the charge.

Order

Based upon the foregoing findings of fact and conclusions of law, it is this 14th day of November 1991, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance who considered this case,

ORDERED, that respondent's license to practice medicine is **SUSPENDED**; and that the suspension shall be immediately **STAYED** and respondent is placed on **PROBATION** for one year from the effective date of this order, subject to the following conditions:

1. Respondent may continue to work as a rating board medical specialist at the Veterans Administration Regional Office and to work in any other position with the Veterans Administration that involves the review of medical records.
2. Except as provided in condition 1 above, respondent may not practice medicine in the state of Maryland.
3. Respondent may petition the conference to permit him to review medical records at a facility in addition to the Veterans Administration. Respondent shall inform the prospective employer of this consent order; the petition shall contain an affidavit signed by the prospective employer attesting to this disclosure.
4. Respondent may not prescribe medications, including controlled dangerous substances.
5. On or before November 1, 1991, respondent shall surrender to the board the following items:
 - a. Respondent's Maryland Controlled Dangerous Substance (CDS) Registration;
 - b. Respondent's United States Drug Enforcement Administration (DEA) Registration;
 - c. DEA Form 104, Voluntary Surrender of Controlled Substances Privileges;
 - d. Any DEA order forms for controlled dangerous substances; and
 - e. All prescription blanks in respondent's possession or control.
6. Respondent will cooperate with the state, through its administrative prosecutors, in any action that involves the Howard and Patapsco Clinics; and be it further

ORDERED, that the board shall order a peer review of respondent's practice at the Howard Medical Walk-in Clinic. The peer reviewers will conduct a chart review and interview respondent; and be it further

ORDERED, that after one year after the effective date of this ORDER, respondent may petition the board for reinstatement of his license without any conditions or restrictions. Respondent shall have the burden of proving to the board's

Board of Physician Quality Assurance Actions

satisfaction that he is competent to practice medicine. The board may require respondent to

1. Take and pass the Special Purpose Examination with a score of at least 75.
2. Correct any deficiencies identified by the Peer Review Management Committee.
3. Submit to an evaluation for clinical competence.

The board reserves the right to consider respondent's moral character in evaluating the petition; and be it further

ORDERED, that if the board has probable cause to believe that respondent has violated a condition of this order, or that respondent has violated the Maryland Medical Practice Act, or that respondent presents a danger to the public health, safety, or welfare, the board, WITHOUT PRIOR NOTICE AND AN OPPORTUNITY FOR A HEARING, MAY VACATE THE STAY OF SUSPENSION AND REINSTATE THE SUSPENSION, provided that respondent is given notice of the board's action and an opportunity for a hearing within thirty days after respondent requests a hearing; and be it further

ORDERED, that this consent order is considered a public document pursuant to *Md. State Gov't. Code Ann.* §10-611, *et seq.* (1990 Cum. Supp.).

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Consent

By signing this consent, I hereby accept and agree to be bound by the foregoing consent order and its conditions and restrictions, consisting of eight pages.

1. By signing this consent, I hereby submit to this order and its conditions.
2. I acknowledge the validity of this order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this order.
3. I acknowledge that by consent to this order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my license of practice as a physician in the state of Maryland.

I, Chong C. Han, M.D., have read this consent order and have carefully reviewed each and every part with my attorney, Daniel H. Scherr, Esquire. I understand it and voluntarily agree to it.

I sign and consent to this order after having an opportunity to consult with counsel and with full understanding of the meaning and terms of the order.

Order for summary suspension of
license to practice medicine

The State Board of Physician Quality Assurance (the board) herein sets forth the following background information as pertinent to this order for summary suspension (the emergency suspension) with regard to the license of Else M. Hillgard, M.D. (the respondent) to practice medicine in the state of Maryland:

1. Respondent is a physician licensed to practice medicine in the state of Maryland.
2. On October 23, 1991, the board voted to summarily suspend respondent's license to practice medicine in Maryland.
3. The Board's determination to summarily suspend respondent's license was based upon the following information:
 - a. In December 1988, the Board of Physician Quality Assurance received information that respondent was prescribing controlled substances for Patient A, a drug abuser. Respondent began treating Patient A on October 25, 1988 for "anxiety disorder depression." The patient had a history of drug abuse. On November 1, 1988, Patient A was admitted to Maryland General Hospital for a drug overdose. Respondent discovered that the patient was on Methadone but continued to prescribe the following drugs:

Date	Drug	Quantity
10/25/88	Ativan 2 mg	30
	Phenergan 25 mg	60
10/26/88	Phenergan 25 mg	30
	Ativan 2 mg	30
	Prozac 20 mg	10
	Propranolol 20 mg	50
	Phenergan 25 mg	30
10/31/88	Ativan 2 mg	50
	Orazepam 2 mg	60
11/10/88	Phenergan 25 mg	50
1/9/89	Xanax 1 mg	50
	Xanax 1 mg	30
1/28/89	Phenergan 25 mg	30
	APAP #4/Codeine	20
	Xanax	30
2/7/89	APAP #4/Codeine	50
2/11/89	Xanax 1 mg	60
2/14/89	Xanax 1 mg	30
	Phenergan 25 mg	50
	APAP #4/Codeine	30
2/21/89	Xanax 1 mg	30
2/27/89	Xanax 1 mg	30
	Propoxyphene 65 mg	100
	Phenergan 50 mg	50
3/07/89	Xanax 1 mg	30
3/14/89	Xanax 1 mg	60

Board of Physician Quality Assurance Actions

	Phenergan 25 mg	60
5/03/89	Oxycodone/ASA	50
5/06/89	Oxycodone/ASA	30
	Diazepam 10 mg	30
5/16/89	Oxycodone/ASA	50

It is below the standard of care for respondent to prescribe medication for a patient who the respondent knows is enrolled in a Methadone program in the absence of consultation or coordination with the treating physician in the Methadone program. The treating physician in the Methadone program is responsible for prescribing medications.

It is a common practice among drug abusers to use Phenergan to enhance the effects of other drugs. A review of the patient's chart fails to reveal why respondent prescribed Phenergan. It is below the standard of care to prescribe Phenergan without indication.

In addition, respondent failed to assess the efficacy of prescribing Ativan and Xanax for this patient. It is below the standard of care to prescribe benzodiazepines for six months without monitoring the patient's response.

- b. In 1989, the United States Drug Enforcement Administration (DEA) investigated respondent's prescribing practices at three pharmacies in the area where respondent maintained an office. The investigation revealed that respondent wrote forty-five prescriptions for Patient B from January 1, 1989 to July 7, 1989 for the following controlled substances:

Number of Prescriptions	Drug	Quantity
14	Valium 10 mg	839
11	Oxycodone	430
7	Percodan	250
6	Halcion 0.25 mg	200
4	Propoxyphene 65 mg	310
1	Phenobarbital 30 mg	30
1	Nembutal 100 mg	15
1	Tussend Expectorant	8 oz

- c. During a nineteen-day period from January 12, 1989 to January 31, 1989, respondent wrote prescriptions for Patient B for 464 tablets of the following controlled substances

Number of Prescriptions	Drug	Quantity
2	Valium	144
3	Percodan	110
2	Halcion 0.25 mg	90
1	Propoxyphene 65 mg	100
1	Oxycodone/ASA	20

- d. The DEA investigation also revealed that respondent wrote thirty-seven prescriptions for Patient C from January 1, 1989 to July 7, 1989 for the following drugs:

Number of Prescriptions	Drug	Quantity
5	APAP No. 4/Codeine	210
7	Seconal 100 mg	165
5	Ativan 2 mg	250
6	Tylenol No. 4	240
6	Lorazepam 2 mg	400
1	Darvocet N100	50
1	Propoxyphene N/APAP	50
5	Clonidine 3 mg	350
1	Chloral Hydrate 500 mg	16

It is a common practice among drug abusers to use Clonidine to enhance the effects of other drugs.

A subsequent peer review of Patient C's medical records found that respondent attempted "to treat [the] addiction with more addictive, but legal medication. No evidence that this is an effective treatment." The peer reviewer concluded that this was "not an accepted treatment in psychiatry."

- e. As a result of the DEA investigation, respondent surrendered DEA permit #AH8248153 on July 25, 1989.
f. On June 27, 1990, the Medical and Chirurgical Faculty (Med Chi) Committee on Drugs reported to the board that "there is evidence of substandard care with regard to [respondent's] prescribing practices." According to the peer review, respondent failed to provide care within the standard of care to the following patients:

Patient D. (DOB 12/11/53). Dx: Addiction Personality. Respondent prescribed medications on a monthly basis from 10/10/87 to 12/24/88 without coordinating the patient's care with the primary care physician. There was no reason for respondent, as the patient's psychiatrist, to prescribe these medications.

Patient E. (DOB 11/11/53). Dx: Addiction Personality. Respondent prescribed barbiturates to this patient despite the patient's desire to be drug free in order to pursue career goals.

Patient F. (DOB 1/24/53). Dx: Addiction Personality. Respondent attempted to treated the patient's addiction with addictive medication.

Patient G. (DOB 4/24/55). Dx: Addiction Personality. This patient saw an internist for primary care. Respondent prescribed medications without coordinating the patient's care with the primary care physician. Respondent may have addicted the patient. According to the patient's chart, respondent prescribed the following drugs:

Date	Drug	Quantity
10/23/87	Xanax 1 mg	60
	Premarin 1.25 mg	100
	Phenergan with Codeine	
11/6/87	Xanax 1 mg	100
12/3/87	Xanax	100

Board of Physician Quality Assurance Actions

	Timoptic Ophthalmic	15 cc
	Premarin 1.25 mg	30
	Phenergan with Codeine	16 oz
	Lidex 5%	120 ml
1/26/88	Xanax 1 mg	60
	Lidex 5%	120 ml
	Timoptic Ophthalmic	15 cc
	Premarin 1.25 mg	30
	Ambenyl	
	Keflex	100
2/22/88	Xanax 1 mg	60
	Premarin 1.25 mg	30
	Phenergan with Codeine	8 oz
	Ampicillin 250 mg	100
	Oscal	
3/14/88	Xanax 1 mg	80
	Phenergan with Codeine	16 oz
4/16/88	Timoptic 0.5%	15 cc
	Xanax 1 mg	50
	Phenergan with Codeine	6 oz
	Oscal	100
4/28/88	Xanax 1 mg	56
	Phenergan with Codeine	16 oz
	Potassium Chloride	16 oz
6/21/88	Xanax 1 mg	56
	Phenergan with Codeine	
	Premarin 1.25 mg	30
	Lidex 5%	120
	Percodan	10
7/19/88	Xanax 2 mg	56
	Premarin	
8/2/88	Xanax	
	Premarin	
9/7/88	Xanax 1 mg	
	Phenergan with Codeine	
9/20/88	Timoptic 0.5%	15 cc
	Phenergan with Codeine	16 oz
	Xanax 1 mg	60
10/18/88	Xanax 1 mg	60
	Phenergan with Codeine	16 oz
10/29/88	Phenergan with Codeine	8 oz
	Clonidine	60
	Tylenol #4	50
11/1/88	Xanax 1 mg	60
	Phenergan with Codeine	16 oz
	Tylenol #4	60
	Clonidine 1 mg	60
	Premarin 1.25 mg	30
11/29/88	Xanax 1 mg	60
	Premarin 1.25 mg	30
	Tylenol #4	60
	Phenergan with Codeine	16 oz
12/13/88	Xanax	
	Phenergan with Codeine	16 oz
	Tylenol #4	60
	Lidex	
	Premarin 1.25 mg	30
1/17/89	Berocca Plus	30
	Phenergan with Codeine	16 oz
	Xanax	50
2/14/89	Phenergan with Codeine	
	Tylenol #4	30

Patient H. (DOB 11/10/50). The progress notes reveal that despite respondent's suspicions that the patient was an addict, respondent continued to pre-scribe addictive drugs. It is below the standard of care to prescribe addictive drugs to a patient who respondent suspected was a drug addict. According to the patient's chart, respondent prescribed the following drugs:

Date	Drug	Quantity
4/5/89	Valium 10 mg	50
	Xanax 0.5 mg	50
	Placidyl 500 mg	15
	Tylox	100
4/18/89	Xanax 0.25 mg	60
	Valium 10 mg	60
	Placidyl 500 mg	15
	Percodan	50
4/22/89	Xanax 0.25 mg	50
	Valium 10 mg	60
	Placidyl 750 mg	15
	Tylox	60
	Imipramine 50 mg	30
5/4/89	Placidyl 500 mg	50
	Imipramine 50 mg	100
	Tylox	60
	Valium 10 mg	60
	Preludin 75 mg	30
	Xanax 0.25 mg	50
5/17/89	Placidyl 50 mg	30
	Valium 10 mg	60
	Tylox	60
6/2/89	Placidyl 50 mg	30
	Valium 10 mg	60
	Tylox	60
	Berocca Plus	30
6/9/89	Imipramine 50 mg	30
	Phenergan 25 mg	100
6/16/89	Valium	
	Tylox	
	Placidyl	
6/23/89	Valium	
	Tylox	
	Placidyl	
	Imipramine	
	Phenergan 25 mg	100

Patient I. (DOB 9/19/58). The peer review found that respondent's practice of prescribing barbiturates to this patient was below the standard of care. According to the patient's chart, respondent prescribed the following drugs:

Date	Drug	Quantity
2/14/89	Sinequan 50	30
	Centrax 10 mg	30
	Halcion 0.25 mg	20
2/21/89	Xanax 1 mg	50
	Nembutal 50 mg	30
3/8/89	Surmontil	50
3/24/89	Surmontil 50 mg	100
	Seconal 100 mg	30

Board of Physician Quality Assurance Actions

	Xanax 1 mg	100
3/27/89	Surmontil 50 mg	100
	Seconal 100 mg	20
	Xanax 1 mg	60
4/4/89	Xanax 1 mg	50
	Seconal 100 mg	50
4/26/89	Xanax 1 mg	75
	Seconal 100 mg	20
6/1/89	Seconal 100 mg	50
	Surmontil	
	Xanax 1 mg	100

Patient J. The peer review found that respondent's practice of prescribing barbiturates was below the standard of care. According to the patient's chart, respondent prescribed the following drugs:

Date	Drug	Quantity
1/4/89	Ativan 2 mg	100
1/8/89	Nembutal 50 mg	20
1/18/89	Nembutal 50 mg	20
	Ativan 2 mg	50
2/2/89	Nembutal 50 mg	30
	Ativan 1 mg	50
2/18/89	Nembutal 50 mg	30
	Ativan 2 mg	100
3/24/89	Nembutal 100 mg	30
	Ativan 2 mg	100
	Ativan 2 mg	100
5/6/89	Nembutal 100 mg	30
	Percocet 100	100
	Ativan	60
6/23/89	Nembutal 100 mg	30

- g. On June 22, 1990, respondent signed a memorandum of agreement with the DEA which granted respondent a certificate of registration to prescribe only Schedule II non-narcotic and Schedule IV drugs. As a condition of registration, respondent agreed to submit a list of all controlled substances she prescribed, administered, or dispensed on a quarterly basis for two years from the date of issuance of the certificate of registration.
4. Beginning in September 1990, the Medical Care Compliance Administration (MCCA) of the state of Maryland Department of Health and Mental Hygiene received numerous phone calls from pharmacists who reported that known drug addicts were presenting Medical Assistance prescriptions written by respondent for Phenergan. It is a common practice among drug abusers to use Phenergan to enhance the effects of abusable drugs.
5. As a result of the information described in paragraph 4 above, MCCA audited all Medical Assistance prescriptions written by respondent for scheduled drugs and submitted for payment from September 1990 through January 1991. The audit revealed that respondent wrote 248 prescriptions using Medical Assistance forms during that time period. Of the 248 prescriptions, thirty-one were written for Phenergan. A review of all Medical Assistance prescriptions written by respondent for scheduled

drugs and submitted for payment from September 1990 to September 1991 indicates that respondent continues to overprescribe scheduled drugs in amounts far exceeding the recommended therapeutic dose.

6. The information received by the board demonstrates that respondent is not practicing in accordance with the accepted standards of a psychiatrist. In particular, recent information obtained from MCCA about respondent's prescribing practices as described in the findings of fact below support the board's finding that the public health, safety, and welfare imperatively requires emergency action.

Findings of fact

- Based upon all the information received by the board in connection with its investigation and including, but not limited to, the background information set forth above and incorporated herein, and the instances described in paragraph 2 below, the board has reason to believe that the following facts are true:
- Respondent's practice of prescribing drugs in amounts exceeding the recommended therapeutic dose demonstrates a failure to meet the standard of care and indicates that respondent is prescribing drugs for illegal or illegitimate medical purposes in the following instances:
 - A review of Medical Assistance prescriptions written for Patient K and submitted for payment to Medical Assistance reveal that respondent wrote the following prescriptions:

Date	Drug	Quantity
2/13/91	Phenergan 50 mg	100
2/27/91	Phenergan 50 mg	60
3/11/91	Ativan 2 mg	60
3/11/91	Phenergan 50 mg	100
3/21/91	Ativan 2 mg	60
3/26/91	Ativan 2 mg	60
4/1/91	Ativan 2 mg	30
4/1/91	Ativan 2 mg	30
4/1/91	Phenergan 50 mg	60
4/17/91	Ativan 2 mg	56
4/25/91	Phenergan 50 mg	50
4/25/91	Ativan 2 mg	50

Prescribing 346 Ativan 2 mg in forty-six days yields approximately 15 mg/day and far exceeds the recommended therapeutic dose of 2 to 6 mg/day.

Since Phenergan potentiates the effect of Ativan, the concomitant prescribing of large amounts of Ativan and Phenergan poses a serious risk to the patient. Simultaneous use of two drugs without appropriate consideration of their possible interaction is an example of inappropriate prescribing that may jeopardize the patient's health.

- A review of Medical Assistance prescriptions written for Patient L and submitted for payment to Medical Assistance reveal that respondent wrote the following prescriptions:

Board of Physician Quality Assurance Actions

Date	Drug	Quantity
2/13/91	Ativan 2 mg	10
2/21/91	Ativan 2 mg	30
2/21/91	Ativan 2 mg	30
2/27/91	Phenergan 50 mg	100
3/4/91	Ativan 2 mg	50
3/11/91	Ativan 2 mg	60
3/23/91	Xanax 1 mg	60
3/25/91	Xanax 1 mg	30
4/1/91	Xanax 1 mg	60
4/1/91	Xanax 1 mg	60
4/1/91	Phenergan 50 mg	100
4/17/91	Pamelor 25 mg	100
4/17/91	Xanax 1 mg	30
4/25/91	Xanax 1 mg	30
4/29/91	Xanax 1 mg	30

Prescribing 180 Ativan 2 mg in twenty-six days exceeds the recommended therapeutic dose. Prescribing 360 Xanax 1 mg in thirty-seven days exceeds the maximum recommended therapeutic dose.

Phenergan potentiates the effects of Ativan and Xanax. Prescribing Ativan and Xanax in amounts exceeding the recommended therapeutic dose with Phenergan endangers the patient's health.

In addition, prescribing Pamelor, an antidepressant with Xanax, an anxiolytic, may cause respiratory depression.

- c. A review of Medical Assistance prescriptions written for Patient M and submitted for payment to Medical Assistance reveal that respondent wrote the following prescriptions:

Date	Drug	Quantity
4/8/91	Xanax 1 mg	30
4/11/91	Xanax 1 mg	30
4/15/91	Xanax 1 mg	50
4/20/91	Xanax 1 mg	50
5/1/91	Xanax 1 mg	35
5/9/91	Xanax 1 mg	60
5/13/91	Xanax 1 mg	50
5/23/91	Xanax 1 mg	30
5/24/91	Xanax 1 mg	30
5/27/91	Xanax 1 mg	50
5/28/91	Xanax 1 mg	50
6/1/91	Xanax 1 mg	50
6/3/91	Xanax 1 mg	50
6/10/91	Xanax 1 mg	50
6/12/91	Xanax 1 mg	60
6/18/91	Xanax 1 mg	60

Prescribing 735 Xanax 1 mg in seventy-one days yields approximately 10/day. The recommended maximum total daily dose is 4 mg. The amount of Xanax that respondent prescribed for Patient M far exceeds the maximum recommended therapeutic dose and jeopardizes the patient's health.

- d. A review of Medical Assistance prescriptions written for Patient N and submitted for payment to Medical Assistance reveal that respondent wrote the following prescriptions:

Date	Drug	Quantity
4/24/91	Valium 10 mg	10
5/1/91	Valium 10 mg	30
5/8/91	Valium 10 mg	50
5/15/91	Valium 10 mg	60
6/6/91	Valium 10 mg	60
6/12/91	Valium 10 mg	50

Prescribing 260 Valium 10 mg in forty-nine days yields approximately 5/day and exceeds the maximum recommended daily dose.

- e. A review of Medical Assistance prescriptions written for Patient O and submitted for payment to Medical Assistance reveal that respondent wrote the following prescriptions:

Date	Drug	Quantity
6/24/91	Xanax 1 mg	20
6/25/91	Xanax 1 mg	30
6/28/91	Xanax 1 mg	60

Prescribing 110 Xanax 1 mg in four days yields approximately 27.5/day which far exceeds the recommended maximum total daily dose of 4 mg. The excessive amount of Xanax that respondent prescribed for Patient O in four days demonstrates that the patient is either abusing the drug or diverting the drug for illegal or illegitimate medical purposes.

- f. A review of Medical Assistance prescriptions written for Patient P and submitted for payment to Medical Assistance reveal that respondent wrote the following prescriptions:

Date	Drug	Quantity
7/16/91	Xanax 1 mg	50
7/23/91	Xanax 1 mg	50
8/05/91	Xanax 1 mg	50
8/19/91	Xanax 1 mg	50
9/3/91	Xanax 1 mg	50
9/4/91	Xanax 1 mg	50
9/13/91	Xanax 1 mg	50

Prescribing 350 Xanax 1 mg in fifty-nine days yields approximately 6/day and exceeds the recommended maximum total daily dose.

- g. A review of Medical Assistance prescriptions written for Patient Q and submitted for payment to Medical Assistance reveal that respondent wrote the following prescriptions:

Date	Drug	Quantity
8/16/91	Xanax 1 mg	60
8/30/91	Xanax 1 mg	70
8/30/91	Xanax 1 mg	70
3/30/91	Xanax 1 mg	70
9/3/91	Xanax 1 mg	70
9/6/91	Xanax 1 mg	70
9/11/91	Xanax 1 mg	70
9/24/91	Xanax 1 mg	70

Prescribing 550 Xanax 1 mg in thirty-nine days yields approximately 14/day and exceeds the recommended maximum total daily dose of 4 mg. The

Board of Physician Quality Assurance Actions

amount of Xanax that respondent prescribed for Patient Q endangered the patient's health.

3. Respondent's practice of prescribing Ativan, Xanax, and Valium to patients K, L, M, N, O, P, and Q from February 13, 1991 through September 24, 1991 indicates that respondent continues to abuse her privilege of writing prescriptions by overprescribing and may be contributing to drug diversion. Respondent's pattern of overprescribing Ativan, Xanax, and Valium poses an immediate threat to the public health, safety, and welfare. In addition, respondent's prescribing of Phenergan and Pamelor in conjunction with benzodiazepines indicates a failure to recognize the potentially dangerous interaction of the various drugs.
4. On October 17, 1991 at 12:00 p.m., respondent was notified of the board's decision to summarily suspend her license and was given an opportunity to appear at the board meeting on October 23, 1991 to show cause why the board should not execute the order for summary suspension.
5. Respondent's retention of a license to practice medicine in Maryland and her ability to continue to treat patients poses a grave risk and an imminent danger to the public health, safety, and welfare of the citizens of the state of Maryland.
6. Based upon the above information, the board has reason to believe that respondent has violated *Md. Health Occ. Ann.* §14-404(a)(22) and (28) (1991 Repl. Vol.).

The pertinent provisions of §14-404(a) provide

- (a) Subject to the hearing provisions of §14-405 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee
- (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state;
- (28) Sells, prescribes, gives away, or administers drugs for illegal or illegal or illegitimate medical purposes.

Conclusions of law

Based upon the foregoing facts, the board finds that the public health, safety, and welfare imperatively require emergency action in this case, pursuant to *Md. State Gov't Code Ann.* §10-405(b) (1984).

Order

It is this 23rd day of October 1991 by the State Board of Physician Quality Assurance

ORDERED, that pursuant to the authority vested in the board by *Md. State Gov't. Code Ann.* §10-405(b) (1984), respondent's license to practice medicine in the state of Maryland is hereby SUMMARILY SUSPENDED; and be it further

ORDERED, that, upon request by respondent, a hearing to consider this summary suspension will be held at the Office of Administrative Hearings, Administrative Law Building, Greenspring Station, 10753 Falls Road, Lutherville, Maryland 21093 on Wednesday, November 20, 1991 at 9:00 a.m.; and be it further

ORDERED, that on presentation of this order, respondent shall surrender to the board's investigator the following items:

- (1) her original Maryland license from the Board of Medical Examiners;
- (2) the renewal card of her license to practice medicine from the Board of Physician Quality Assurance;
- (3) DEA Certificate of Registration Number BH2412687;
- (4) Maryland Controlled Dangerous Substances Registration Certificate Number M10194;
- (5) all Medical Assistance prescription forms; and
- (6) any prescription pads on which her name and DEA number are imprinted; and be it further

ORDERED, that a copy of this order shall be filled with the board in accordance with *Md. Health Occ. Code Ann.* §14-407 (1991 Repl. Vol.).

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

In the matter of
Edward O. Hunt, Jr., M.D.
before the
Maryland Board of
Physician Quality Assurance
Order reinstating license.

By order (Appendix A) dated July 2, 1991, the Board of Physician Quality Assurance (the board) found Edward O. Hunt, Jr., M.D. (the respondent) guilty of committing a prohibited act as set forth in Health Occupations Article, §14-404(b). The order provides that on August 1, 1991, if the respondent demonstrates to the board's satisfaction that respondent had complied with the terms and conditions of the July 2, 1991 order, the board would entertain a petition for reinstatement of the respondent's license to practice medicine. By letter dated August 5, 1991, respondent petitioned the board for reinstatement of his license (petition) to practice medicine in Maryland. At its meeting on August 14, 1991, the board, through its settlement conference (the conference) reviewed respondent's petition. Based upon the board's review of the petition, the board determined that respondent had fulfilled the conditions contained in the 1991 order.

Findings of fact

Based on the information known and available to it, the board finds that respondent had developed a plan to take the

Board of Physician Quality Assurance Actions

additional twenty-five hours of Category 1 continuing medical education.

Conclusions of law

The board concludes, as a matter of law, that respondent has satisfactorily complied with the condition set forth in the order of July 2, 1991.

Order

Upon the foregoing findings of fact and conclusions of law, it is this 4th day of September 1991, by a majority vote of the full authorized membership of the board.

ORDERED, that effective as of the date of this order, the sanction of revocation imposed upon respondent's practice of medicine by the board's July 1991 order is hereby STAYED; and be it further

ORDERED, that respondent's license to practice medicine in the state of Maryland be REINSTATED; and be it further

ORDERED, that respondent is placed on probation subject to the following conditions:

1. Respondent shall be required to take an additional twenty-five hours of Category 1 continuing medical education in the field of family practice in addition to the continuing education requirements for renewal; and
2. Respondent will practice medicine according to the laws of Maryland; and be it further

ORDERED, that THREE YEARS AFTER THE EFFECTIVE DATE OF THIS ORDER, the board will entertain a petition for termination of respondent's probationary status and reinstatement of respondent's license to practice medicine in the state of Maryland without any conditions or restrictions whatsoever. If the respondent has complied with all conditions of probation and if there are no outstanding complaints against respondent, the board will reinstate the respondent's license without any conditions or restrictions whatsoever; and be it further

ORDERED, that this is a final order and as such is considered a public document pursuant to the Maryland Public Information Article, State Government Article, *Annotated Code of Maryland*, §§10-611 *et seq.*, specifically §10-617(h)(2)(vi).

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Appendix A

In the matter of
Edward O. Hunt, Jr., M.D.
before the
Maryland Board of
Physician Quality Assurance

Final decision

On October 11, 1990, the Board of Physician Quality Assurance (the board) issued charges against Edward O. Hunt, Jr., M.D. (the respondent). Specifically, the board charged respondent under

the Maryland Medical Practice Act (the act), *Md. Health Occ. Code Ann.*, §14-404(b) which states

(b) Crimes involving moral turpitude.

- (1) Subject to the Administrative Procedure Act, the board shall order the suspension of a license if the licensee is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside.
- (2) After completion of the appellate process if the conviction has not been reversed or the plea has not been set aside with respect to a crime involving moral turpitude, the board shall order the revocation of a license subject to the hearing provisions of §14-405.

A hearing was held on January 22, 1991 before an administrative law judge (ALJ). Present at the hearing were the respondent, Edward O. Hunt, Jr., M.D.; the respondent's counsel, Emanuel Levin, Esquire; Ruth and Susan Hunt, wife and daughter of respondent; Robert J. Gilbert, assistant attorney general, administrative prosecutor, and the ALJ.

At the hearing, the state introduced the following evidence:

State exhibit A. Indictment and docketing entries.

State exhibit B. Official transcript of proceedings.

The respondent introduced the following evidence:

Respondent exhibit A. Letters and documents in mitigation.

Respondent exhibit B. Motion for modification of sentence.

The following witness testified for respondent: Katie Grove.

After the hearing was adjourned, respondent's counsel sought and was granted a delay in rendering an opinion because of the pendency of a request for modification in the circuit court. The court subsequently issued its order modifying the earlier results to probation before judgment (PBJ).

On May 1, 1991, the ALJ filed a recommended decision notifying the parties of their right to file exceptions and request oral argument. The parties did not file exceptions or request oral argument. The board notified the parties on May 31, 1991, that it would consider the ALJ's recommended decision and issue a final decision. The parties were notified of their right to file exceptions and make oral argument. Mr. Levin requested that he make oral argument but filed no exceptions. The state neither filed exceptions nor requested oral argument. At its meeting on Wednesday, June 26, 1991, the board considered respondent's. By a majority of its full authorized membership, the board voted to issue the following decision.

Findings of fact

By clear and convincing evidence, the board finds that

1. At all times relevant to these charges, the respondent was and is licensed to practice medicine in the state of Maryland.
2. On or about April 20, 1990, the respondent was indicted by the Grand Jury for Baltimore City, under indictment number 19011020, for the charge of theft over three hundred dollars.
3. On or about May 30, 1990, in the Circuit Court for Baltimore City, part 21, the respondent pleaded guilty to the aforementioned charge.
4. On or about July 11, 1990, as a result of the guilty plea in indictment number 19011020, the respondent was sentenced to a term incarceration of two years, which was suspended in favor of a period of supervised probation of two years. The respondent was further ordered to pay restitution in the amount of \$6,256.23;

Board of Physician Quality Assurance Actions

to perform four hundred hours of community service and to pay the costs of the court.

5. The crime of theft over three hundred dollars as described in paragraphs two, three, and four, is a crime involving moral turpitude under the act.
6. The respondent did not file an application for leave to appeal to the Court of Special Appeals within the time required by Md. Rule §8-204.
7. The special circumstances in this case are that the crime of which respondent is convicted include no theft of monies for patient care.
8. According to respondent, he was unaware that by pleading guilty to this crime that his license would be automatically revoked.

Conclusions of law

Based upon the foregoing findings of fact, the board concludes as a matter of law that respondent follows under the mandate of HO §14-404(b), which provides

(b) Crimes involving moral turpitude.

- (1) Subject to the Administrative Procedure Act, the board shall order the suspension of a license if the licensee is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside.
- (2) After completion of the appellate process if the conviction has not been reversed or the plea has not been set aside with respect to a crime involving moral turpitude, the board shall order the revocation of a license subject to the hearing provisions of §14-405.

Order

Based upon the foregoing findings of fact and conclusions of law as mandated by Health Occupations Article, §14-404(b), it is this 2nd day of July 1991

ORDERED, that the respondent's license to practice medicine be REVOKED; and be it further

ORDERED, that on August 1, 1991, respondent can submit a petition to the board for reinstatement of his license if he has a plan for taking an additional twenty-five hours of Category 1 continuing medical education; and be it further

ORDERED, that if respondent submits such petition, respondent will be scheduled to appear at the board's settlement conference (conference) on Wednesday, August 14, 1991 at which time the conference may stay the revocation of his license and enter into a consent order wherein respondent is placed on probation for three years subject to certain conditions; and be it further

ORDERED, that if respondent submits a plan whereby he will take an additional twenty-five hours of Category 1 continuing medical education in the field of family practice which is satisfactory to the conference, these hours will be in addition to the continuing education requirements for renewal; and be it further

ORDERED, that this is a final order and as such is considered a public document pursuant to State Government Article, *Annotated Code of Maryland*, §10-611 *et seq.*

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

In the matter of
Thomas A. Pittman, M.D.
before the
Maryland Board of
Physician Quality Assurance

Dear Dr. Weiner and members of the board:

Please be advised that I have decided to surrender my license to practice medicine in Maryland. I understand that I may apply for reinstatement of my license after I meet certain requirements which are described in this letter of surrender. Therefore, my decision to surrender my license is REVOCABLE.

I understand that this letter of surrender will be considered a PUBLIC document.

On May 8, 1991, the Board of Physician Quality Assurance (the board) voted to summarily suspend my medical license and charge me pursuant to *Md. Health Occ. Code Ann.* §14-404(a)(4) (1991 Replacement Volume). Section 14-404(a)(4) provides in pertinent part:

Subject to the hearing provisions of §14-405 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

(4) Is professionally, physically, or mentally incompetent.

The board also voted that if I surrendered my license it would not proceed to issue either the charges or the summary suspension. Prior to the issuance of charges against me, I advised my attorney, Philip Sturman, Esquire, and the board, that I wished to voluntarily surrender my license to the board. Consequently, my decision to surrender my license will result in the board's rescinding its vote to charge me and summarily suspend my license.

My decision to surrender my license and discontinue the practice of medicine has been prompted by my desire to avoid being charged under the Maryland Medical Practice Act, *Md. Health Occ. Code Ann.* §14-404 (1991 Replacement Volume). The basis for charges against me is my current need for psychiatric treatment and my ongoing problems with abuse of prescribed medications and periodic alcohol abuse.

I have not practiced medicine in Maryland since November 1990. I hereby affirm that I do not have any hospital privileges in Maryland, Georgia, or any other state in the United States. I am licensed to practice medicine in the State of Georgia. I acknowledge upon acceptance of this letter, the board will send a copy of this letter of surrender to

Mr. Andrew Watry, Executive Director
Georgia Composite State Board of Medical Examiners
166 Pryor Street, S.W.
Atlanta, Georgia 30393

I agree to sign DEA Form 104, Voluntary Surrender of Controlled Substances Privileges. I acknowledge that the board will send my DEA Registration Certificate, DEA Form

Board of Physician Quality Assurance Actions

104, and a copy of this letter of surrender to Robert Bickel, Group Supervisor, DEA, 31 Hopkins Plaza, Room 955, Baltimore, Maryland 21201.

I hereby affirm that I do not have any DEA order forms for schedule I or II drugs.

I acknowledge that the board will send my Maryland CDS Registration Certificate and a copy of this letter of surrender to Charles Tregoe, Chief, Division of Drug Control, 4201 Patterson Avenue, Baltimore, Maryland 21215.

Before the board accepts this letter of surrender as a resolution of case number 87-0599, I must present to the board the following:

1. Maryland License D10875, Renewal Certificate and wallet-size renewal card.
2. United States Drug Enforcement Administration Registration Certificate AP6784933 which permits me to prescribe controlled dangerous substances in Maryland, and DEA Form 104.
3. Maryland Controlled Dangerous Substances Registration Certificate issued by the Maryland Division of Drug Control.
4. All prescription pads in my possession or control.
5. All controlled substances in my possession or control other than those that are prescribed to me by another licensed physician.

In executing this letter of surrender, I understand that I may apply for reinstatement of my license to practice medicine in Maryland at any time that I wish, provided that I have a letter from my treating psychiatrist which states that he or she believes that I am mentally competent to practice medicine.

If I apply for reinstatement of my license I acknowledge that I bear the burden of demonstrating to the board that I am competent to practice medicine. I understand that the board will require a statement from my treating psychiatrist which states that he or she believes I am competent to practice medicine. I further understand that the board will require an independent psychiatric evaluation of me prior to deciding whether to reinstate my license. I understand that the board will consider the independent psychiatric evaluation of me in deciding whether to reinstate my medical license.

Further, I understand that I must demonstrate that I have the cognitive and clinical competence to practice medicine. Additionally, I must demonstrate that I have taken fifty continuing education hours, which is appropriate for the field of medicine I wish to enter, for each year I have not practiced. I further understand that the board may require that I be appropriately evaluated for clinical competence prior to my reinstatement. I understand that I must demonstrate to the board's satisfaction that I possess good moral character as specified in *Md. Health Occ. Code Ann.* §14-307(b) (1991 Replacement Volume).

Until the board grants my request for reinstatement, I understand that I may not give medical advice to any in-

dividual,¹ for compensation or otherwise, and cannot prescribe medication. In other words, I understand that the surrender of my license means that I am an unlicensed physician.

Finally, I wish to make clear that I have consulted with an attorney before signing this letter SURRENDERING my license to practice medicine in Maryland. I understand both the nature of the matters against me and also this letter of surrender. I make this decision voluntarily and knowingly.

Sincerely,
THOMAS A. PITTMAN, M.D.

On behalf of the Board of Physician Quality Assurance, on this 17th day of July 1991, I accept Thomas A. Pittman, M.D.'s PUBLIC REVOCABLE surrender of his license to practice medicine in Maryland.

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

■ ■ ■
In the matter of
Babu Y. Rao, M.D.
before the
Maryland Board of
Physician Quality Assurance

Order for reinstatement of a license

By final decision dated June 14, 1988, the Commission on Medical Discipline (CMD) revoked the medical license of Babu Y. Rao, M.D. (the respondent). The final decision provided as follows regarding respondent's petitioning for reinstatement of his license:

Respondent may move for reinstatement of his medical license by submitting evidence acceptable to the commission or its successor, the Maryland Board of Physician Quality Assurance, indicating that he is able to practice medicine in a competent fashion; and it is further

ORDERED, that any such motion for reinstatement must include proof that respondent has successfully completed an intensive, long-term physician retraining program such as that offered by the University of Maryland under the auspices of Edward J. Kowalewski, M.D., or in the alternative, has successfully completed a one-year residency program in the field of family practice.

Respondent petitioned the board through its settlement conference for reinstatement of his license on March 13, 1991. At its meeting on April 24, 1991, the board considered the settlement conference's recommendation and voted by an affirmative vote of the majority of the full authorized membership to enter into this consent order which supersedes the CMD's final order of June 1988.

1. This does not include dissemination of information such as teaching at a medical school.

Board of Physician Quality Assurance Actions

Findings of fact

1. The findings of fact of the CMD's final decision dated June 14, 1988, are incorporated by reference.
2. Respondent's license was revoked on June 14, 1988.
3. Respondent presented the following information at the settlement conference:
 - a. Respondent had attempted but was unable to find a year program in which to become retrained.
 - b. Respondent had taken the Special Purpose Examination (SPEX) and passed.
 - c. Respondent had been working in a preceptorship under the supervision of John S. Braxton, Jr., M.D. and Simon H. Carter, Jr., M.D., both of whom recommended that respondent be allowed to practice hands on medicine.
4. Respondent petitioned the board to stay the revocation of his license and permit him to practice medicine.

Conclusions of law

The board incorporates by reference the conclusions of law contained in the Commission on Medical Discipline's final decision of June 14, 1988.

Order

By a majority vote of the full authorized membership of the board considering this matter, it is hereby this 27th day of August 1991

ORDERED that the REVOCATION of respondent's license to practice medicine in Maryland is hereby STAYED; and be it further

ORDERED, that respondent is subject to the following conditions of PROBATION:

1. Respondent shall not prescribe any medication for which a state or federal permit is required;
2. Respondent may only practice medicine in the practice of John S. Braxton, Jr., M.D. and Simon H. Carter, Jr., M.D. and under their immediate supervision; and
3. Respondent must take twenty additional Category 1 hours of continuing education each year during the probation which is approved by the settlement conference or weekly review panel. Twenty hours must be taken by March 1, 1992; and be it further

ORDERED, that in the event that the respondent terminates his position with Drs. Braxton and/or Carter, he must notify the board within twenty-four hours of his termination; and be it further

ORDERED, that Drs. Braxton and Carter must submit monthly reports to the board, on October 1, 1991; November 1, 1991; December 1, 1991; January 1, 1992; and February 1, 1992, evaluating respondent's practice. The reports must include, at minimum, the number of hours respondent works, how many patients respondent sees weekly, the types of chief complaints presented to respondent, and an evaluation of respondent's treatment; and be it further

ORDERED, that Drs. Braxton and Carter must assure that respondent comply with the standards of medical recordkeeping enunciated by the board; and be it further

ORDERED, that by September 1, 1991, respondent must present evidence to the board, that he has presented copies of this order to Drs. Braxton and Carter; that Drs. Braxton and Carter understand their duties and responsibilities under the order and that they will comply with the requirements to supervise respondent and submit quarterly reports to the board as set forth above; and be it further

ORDERED, that respondent must continue to attend grand rounds at Johns Hopkins Hospital; and be it further

ORDERED, that on March 1, 1992, the Peer Review Management Committee (PRMC) of the Medical and Surgical Faculty (the Faculty) shall conduct a practice review and an office visit. PRMC will review at least thirty patient records, and will be permitted to review Drs. Carter's and Braxton's evaluations; and be it further

ORDERED, that after the board has received the PRMC's report, a settlement conference (the conference) will be scheduled to determine how to proceed, i.e. whether to lift all conditions of probation, whether to require respondent to conditioned practicing under supervision, or whether respondent must remediate any deficiencies noted by PRMC. At that time, respondent must submit a list of all continuing education courses completed from June 1, 1991 to March 1, 1992 and of his attendance at grand rounds; and be it further

ORDERED, that if the board receives a report that respondent has violated a term of probation, the board, WITHOUT PRIOR NOTICE AND AN OPPORTUNITY TO BE HEARD MAY LIFT THE STAY OF SUSPENSION OF RESPONDENT'S LICENSE, provided that respondent is given immediate notice of the charges and an opportunity to be heard thirty days after requesting same. Any findings made in such a hearing shall be by a preponderance of the evidence; and be it further

ORDERED, that this order is considered a public document pursuant to *Maryland State Government Code Ann.*, §§10-611, *et seq.*

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Consent

By signing this consent, I, Babu Y. Rao, M.D., hereby accept and agree to be bound by the foregoing consent order and its conditions and restrictions, consisting of seven pages.

1. By signing this consent, I hereby submit to this order and its conditions.
2. I acknowledge the validity of this order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this order.
3. I acknowledge that by consent to this order, I am waiving

Board of Physician Quality Assurance Actions

my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take action against my license to practice medicine in the state of Maryland.

I, Babu Y. Rao, M.D., have read this consent order and have had an opportunity to review same with attorney. I understand it and voluntarily agree to it.

I sign and consent to this order after having an opportunity to consult with counsel and with full understanding of the meaning and the terms of the order.

BABU Y. RAO, M.D. ■

■ ■ ■

**In the matter of
Bruce L. Regan, M.D.
before the
Maryland Board of
Physician Quality Assurance
Consent order**

On July 11, 1991, the State Board of Physician Quality Assurance (the board), pursuant to its authority under *Md. Health Occ. Code Ann.*, §14-404, charged Bruce L. Regan (the respondent) under the Maryland Medical Practice Act (the act), *Md. Health Occ. Code Ann.* §14-404 (1991 Replacement Volume).¹

The pertinent provision of the act under HO §14-404 provides

(a) Subject to the hearing provisions of §14-405 of this subtitle,

1. The basis of the allegations against respondent is conduct that occurred between August 1982 and February 1991. The applicable statute in effect in August 1982 was *Md. Health Occ. Code Ann.* §14-504(23) which provided

Subject to the hearing provisions of §14-505 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

Chapter 593, Acts of 1957, effective July 1, 1987 inserted the following italicized words in former Section (23)

Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality *MEDICAL AND* surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state.

Chapter 109, Section 1, Acts of 1988, effective July 1, 1988, designated the existing provisions of the section as subsection (a), and redesignated former Section (23) as Section (a)(22).

Section 11, Chapter 6, Acts 1990, approved February 16, 1990, effective on or about January 1, 1991, renumbered HO §14-504(a)(22) as HO §14-404(a)(22).

the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee

(22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this state;

On September 11, 1991, a settlement conference (the conference) was held. Present were John F. Strahan, M.D., chief settlement officer; Frank A. Gunther, Jr., board member; J. Andrew Sumner, M.D., board member; Steven J. Poliakoff, acting board counsel; Elizabeth H. Trimble, assistant attorney general; Charles Cichon, case manager; Bruce L. Regan, M.D., respondent; and Barbara Mello, Esq., counsel for respondent. As a result of discussions at the conference, respondent agreed to enter into a consent order and the conferees recommended that the board accept a consent order as a resolution of this case. At the board meeting on September 25, 1991, by an affirmative vote of a majority of the board members who considered this case, the board voted to enter into the following consent order.

Findings of fact

1. At all times relevant to these charges, respondent was and is licensed to practice medicine in the state of Maryland.
2. Respondent maintains a private office for the practice of medicine at the Catonsville Professional Center, 405 Frederick Road, Baltimore, Maryland.
3. Respondent's practice is limited to psychiatry.
4. Patient A was a patient of respondent's from November 1980 to October 1990. Patient A initially sought treatment from respondent to determine if there was a psychological factor to the severe headaches he had been suffering for the past seven years. He continued in individual and group therapy with respondent for the next ten years.
5. Beginning in 1980, respondent prescribed for Patient A narcotic analgesics for his headache pain. He continued to prescribe this type of drug for Patient A in increasing dosages and increasing frequencies of use for the next ten years.
6. During the ten-year time period, respondent changed the analgesic drugs he prescribed for Patient A several times, but he made no notation in the patient records of his rationale for changing the medication.
7. In 1987, a neurologist with whom Patient A consulted, reported to respondent his concern of possible narcotic dependency, and the excessive number of drugs which the respondent was prescribing for this patient. Respondent did not alter his prescribing patterns in any way in response to this report.
8. In 1988, respondent was advised by Donald Pachuta, M.D. of the Medical and Chirurgical Faculty Committee

Board of Physician Quality Assurance Actions

on Drugs, that the psychiatrists on that committee were unanimous in concluding that the type of care and prescribing reflected in Patient A's records were "out of the purview of psychiatry and that a psychiatrist should never be the prescribing physician for [a narcotic analgesic] in a case like this, if ever ... The committee members believe you should treat him psychiatrically only." In spite of this warning, respondent continued to prescribe narcotic analgesics for Patient A for two and a half more years.

9. During his ten years of treatment of Patient A, the respondent failed to keep proper records reflecting the reasons for prescribing certain drugs to that patient, he prescribed drugs outside the area of his expertise, he prescribed parenteral narcotics in dosages in excess of those recommended, and he ignored indications that this patient was suffering physical effects of overmedication, including possible addiction. Further, he ignored direct warnings and instructions given him by the Medical and Chirurgical Faculty Committee on Drugs.
10. The board requested the Maryland Psychiatric Association to appoint a peer review committee to review the records on Patient A and to interview respondent about his treatment of this patient. This committee concluded, "that the care was inappropriate and the standard of care for chronic cephalgia on an outpatient basis by a psychiatrist clearly would preclude the use of a daily high frequency of injectable narcotics over an eight-year span."
11. One member of the peer review committee reviewed records on eight additional patients of respondent's for the purpose of considering his practice of prescribing and found those records to be "poorly organized and incomplete (records regarding medication were unclear, incomplete or inconsistent) and thus of little value to our wish to peruse the prescribing patterns for the respondent."
12. The peer review committee performed a practice review of respondent by examining the files of nine additional patients. With respect to one of these patients, the committee found a pattern of treatment similar to that of Patient A. As to the care of this patient, referred to in the committee's report as Case #9, they said

Case #9 reflects the very chaotic treatment of a profoundly disturbed and apparently borderline substance abuser. It is reminiscent of case #1 (Patient A) insofar as there is clearly a prescribing practice — in this case, of benzodiazepines — that is outside the accepted standard of care. In addition, there is notation in the medical record that there is a possibility of overmedication, yet the prescribing practice seems to continue without reflecting that concern.

... In addition to what appears to be inappropriate prescribing and recordkeeping of benzodiazepines in a patient quite likely to be abusing, there is also the prescription of many nonpsychiatric medications for the patient without any clear direction from an appropriate consultant or notations of physical examination and diagnosis.

13. Respondent's treatment of Patient A and Case #9 fell below the standard of care required of a physician in those

circumstances, and that deviation from the standard of care in each case continued for an extended period of time. Further, his recordkeeping regarding prescription drugs has been inadequate for a similarly lengthy period of time.

Conclusions of law

Based upon the foregoing findings of fact, the board concludes, as a matter of law, that the respondent is guilty of failing to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical care, in violation of *Md. Health Occ. Code Ann.* §14-404(a)(22).

Order

Based on the foregoing findings of fact and conclusions of law, it is this 22nd day of October 1991, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case, hereby

ORDERED, that respondent's license to practice medicine in the state of Maryland is suspended for a period of three years, beginning October 1, 1991; and it is further

ORDERED, that the suspension of respondent's license to practice medicine is IMMEDIATELY STAYED and respondent is placed on probation for a period of three years, beginning October 1, 1991, on the following terms and conditions:

1. On or before November 15, 1991, respondent shall submit to a psychiatric evaluation by a physician chosen from the following list:

Thomas Lynch, M.D.	Arthur Hildreth, M.D.
Lex Smith, M.D.	William Wimmer, M.D.
Irvin Cohen, M.D.	Robert Lessey, M.D.

This evaluation shall include psychological testing (including unconscious and characterological parameters) with a clear focus on whether characterological issues make respondent particularly vulnerable for this kind of difficulty (i.e., saying no to demanding patients, particularly in the area of prescribing drugs). Respondent shall be re-evaluated by that physician or another one approved by the peer review committee (the committee) on at least a yearly basis during the period of the probation. Respondent shall pay all costs associated with the evaluations. Respondent shall sign a release authorizing the physician who performs each evaluation to send copies of his reports to the board. Respondent shall sign a release authorizing the board to release the reports to the peer review committee and to the respondent's therapist.

2. Respondent shall participate in psychotherapy with Carl Schleifer, M.D. (therapist).
 - a. The therapist will see respondent for therapy on at least a weekly basis, and more often if the therapist thinks it is appropriate. If the therapist subsequently determines that therapy sessions do not need to take place on such a frequent basis, he shall notify the board of

Board of Physician Quality Assurance Actions

- the change in schedule. Respondent must follow the recommendations for the number of therapy sessions made to respondent.
- b. Respondent shall be responsible for all costs and expenses incurred in therapy.
 - c. Respondent shall continue in therapy for as long as this order is effective.
 - d. The therapist shall submit monthly reports to the committee, indicating that respondent is attending the therapy sessions as recommended.
 - e. In the event that respondent terminates therapy prior to discharge by the therapist, the therapist shall IMMEDIATELY notify the committee that respondent has terminated therapy.
 - f. In the event that Dr. Schleifer is unable to continue treatment, through no fault of respondent's, the therapist or the respondent must IMMEDIATELY notify the committee. The committee, within ten days of receipt of the notice, shall present respondent with a list of three approved psychiatrists from whom respondent must immediately select another therapist. The new therapist must inform the committee in writing that he/she agrees to perform all duties required under this order.
3. Respondent shall perform his private practice of psychiatry in Maryland only under the supervision of one of the following psychiatrists:
Richard H. Anderson, M.D.
Arthur M. Hildreth, M.D.
Mayer C. Liebman, M.D.
 4. Respondent shall meet with the supervising physician prior to November 1, 1991, and, following that meeting, the supervising physician shall notify the board, in writing, that he understands the terms of this order and has reviewed all previous peer review reports. The supervising physician will be furnished a copy of the results of the psychiatric evaluation set forth in paragraph 1 of this order as soon as it is completed.
 5. The supervising physician will meet with respondent for weekly supervisory sessions during the period of the probation, with the exception of the times when one or both are on vacation. He will determine how much time each week is needed to review respondent's practice. The supervision shall include clinical supervision of respondent's diagnosis and treatment of patients with particular emphasis on the rationale for and use of prescription medication. The supervising physician will also advise respondent on the setting-up and maintenance of patient record systems and will monitor his recordkeeping during the term of this order. Respondent will provide the supervising physician at each weekly meeting with a list of all the controlled dangerous substances which he has prescribed during the previous week.
 6. The supervising physician will make quarterly written reports about respondent's practice of psychiatry to the board, attention: Charles Cichon, case manager. The reports are due on January 1, April 1, July 1, and October 1 of each year of the probationary period, with the first report due on January 1, 1992.
 7. In the event that the supervising physician believes that respondent is in violation of this order, he shall IMMEDIATELY notify the board.
 8. In the quarterly report due July 1, 1993, the supervising physician will discuss whether weekly supervisory sessions should be continued. The board must ratify the supervising physician's recommendations before any change in supervision becomes effective.
 9. Respondent shall pay all costs associated with the weekly supervisory sessions and the quarterly reports. The supervising physician will submit a bill to respondent on a monthly basis. If respondent fails to pay the bill within thirty days, the supervising physician shall notify the board. Failure to pay all bills within thirty days shall result in a violation of this order.
 10. Respondent will be subject to an annual peer review of his practice by the peer review committee, administrative costs to be paid by respondent. The committee will submit a report to the board once each year on the results of the peer review of respondent's practice, the first report being due on or before October 1, 1992. Respondent must follow any recommendations made by the committee and endorsed by the board.
 11. Respondent shall practice in accordance with the law governing the practice of medicine in Maryland.
 12. Respondent shall be responsible for all costs for the supervision and psychiatric therapy that he is to obtain during this probation.
 13. Respondent shall, during the period of his probation, attend courses in one or more of the subject areas of prescribing controlled and dangerous substances, managing difficult and addiction-prone patients, psychopharmacology, and abusive and dangerous drugs, as directed by the supervising physician. Respondent shall pay all costs associated with his attendance at these courses.
- ORDERED, that if respondent violates any of the foregoing conditions of probation, the stay may be lifted and the board, after notification, a hearing, and a determination of violation, may impose any additional disciplinary sanctions it deems appropriate; and be it further
- ORDERED, that if respondent presents a danger to the public health, safety, or welfare, the board, WITHOUT PRIOR NOTICE AND AN OPPORTUNITY FOR A HEARING, MAY VACATE THE STAY OF SUSPENSION AND REIN-

Board of Physician Quality Assurance Actions

STATE THE SUSPENSION, provided that respondent is given notice of the board's action and an opportunity for a hearing within thirty days after respondent requests a hearing; and be it further

ORDERED, that, three years after the effective date of the order, that being the date on which the board signs the order, respondent may petition the board for termination of probation and reinstatement of his license without any conditions or restrictions. Prior to submitting his petition for reinstatement, respondent must be evaluated by a psychiatrist selected by the board. Respondent shall bear the burden of proving, to the board's satisfaction, that he has complied with all the conditions of this order. NOTHING IN THIS ORDER SHALL BE CONSTRUED AS A PROMISE BY THE BOARD TO REINSTATE RESPONDENT'S LICENSE WITHOUT CONDITIONS; and be it further

ORDERED, the respondent will be responsible for all costs incurred under this consent order; and be it further

ORDERED, that this consent order is considered a public document pursuant to *Md. State Gov't. Code Ann.* §10-611 *et seq.* (1984).

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Consent

By signing this consent, I hereby accept and agree to be bound by the foregoing consent order and its conditions and restrictions, consisting of twelve pages.

1. I admit to the truth of the findings of fact and agree with the conclusions of law set forth above.
2. I acknowledge the validity of this order as if made after a hearing in which I would have had the right to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law.
3. I also recognize that I am waiving my right to appeal any adverse ruling of the board that might have followed any such hearing. By this consent I waive all such rights.
4. I understand that if I fail to comply with any of the conditions of probation enumerated above, the board, after notification, a hearing, and a determination of violation, may impose any additional disciplinary sanctions it deems appropriate.
5. I have had an opportunity to review this order. I voluntarily sign this order understanding its meaning and effect.

BRUCE L. REGAN, M.D.

BARBARA MELLO, ESQ., Counsel for Dr. Regan ■

In the matter of Sang Kyun Shin, M.D. before the Maryland Board of Physician Quality Assurance Final decision

On November 21, 1988, the Maryland Board of Physician Quality Assurance (the board) charged Sang Kyun Shin, M.D. (respondent), pursuant to §14-504, Health Occupations Article of the *Annotated Code of Maryland* (HO). Respondent was charged as follows:

Is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside; HO §14-504(6)

Is ... convicted ... by a court of any state or country for an act that would be grounds for disciplinary action under this section [HO §14-504(22)];

Grounds for disciplinary action under this section are

Is guilty of immoral or unprofessional conduct in the practice of medicine [HO §14-504(3)]

Willfully makes or files a false report or record in the practice of medicine [HO §14-504(12)];

A hearing was scheduled before a hearing officer pursuant to HO §14-504, commenced on July 7, 1989, and was continued on August 15, 1989. Present at the hearing were the hearing officer; Alice D. Ike, assistant attorney general, administrative prosecutor for the board; Anton J.S. Keating, Esquire, attorney for the respondent; respondent; respondent's witnesses and the court stenographer.

Summary of evidence

State exhibit 1. Letter to Dr. Shin dated November 21, 1988, four pages.

State exhibit 2. Charges issued November 21, 1988, four pages.

State exhibit 3. Summons and notice of charges and hearing, two pages.

State exhibit 4. Certified copy of docket entries, two pages.

State exhibit 5. Criminal information number 28736403, three pages.

State exhibit 6. Statement of facts, 11 pages.

Respondent introduced the following exhibits which were admitted into evidence, in part over objection by the administrative prosecutor:

Respondent exhibit 1. Curriculum vitae of respondent.

Respondent exhibit 2. Letter of Louis C. Breschi, M.D.

Respondent exhibit 3. Letter of Jane T. Lew, M.D.

Respondent exhibit 4. Letter of Betty Jane Ristau.

Respondent exhibit 5. Letter of Kathryn Ayers.

Respondent exhibit 6. Letter of Chang Ho Kim.

Respondent exhibit 7. Letter of Chi Bon Jang, D. Min.

Respondent exhibit 8. Letter of David M. Lanphear, M.D.

Respondent exhibit 28A. List of private patients — Essex office (throat cultures given in same situation).
Respondent exhibit 29A. List of private patients — Fallston office.
Respondent exhibit 30. Summary
Respondent exhibit 31A. Judgment calls.
Respondent exhibit 31B. Acute rheumatic fever in western Pennsylvania and the tristate area.
Respondent exhibit 31C. Preventive value of diagnosing and treating streptococcal throat infections.
Respondent exhibit 31D. The recognition of streptococcal pharyngitis.
Respondent exhibit 31E. Streptococci in children's respiratory infections, diagnosis, and treatment.
Respondent exhibit 31F. Report of the Committee on Infectious Diseases, twenty-first edition, 1988.
Respondent exhibit 31G. Severe group A streptococcal infections with a toxic shock-like syndrome and scarlet fever toxin A.
Respondent exhibit 32. Letter of Margaret Anzalone dated August 10, 1989 with list of physicians prosecuted by the Medicaid Fraud Control Unit and three final orders; Letter of Judith Griffith dated August 11, 1989 with two final orders.
Respondent exhibit 33. List of physicians prosecuted by the Medicaid Fraud Control Unit, and letter of Gale Caplan dated June 26, 1989.

The following documents were introduced into evidence without objection as hearing officer's exhibits:

Hearing officer exhibit 1. Stipulation signed by Alice D. Ike, Esquire and Anton J.S. Keating, Esquire, six pages.

Hearing Officer Exhibit 2. List of witnesses.

The following persons testified for the respondent:

Davood Badie, M.D., a pediatrician practicing in Fallston.
Patricia Lewis, whose children were seen for nine years.
Patricia Day, a physical therapist's aide who has known the respondent seven and one-half years and has used him as her family pediatrician.

Young Ho Yu, M.D., an obstetrician/gynecologist who refers patients to the respondent for pediatric care and who has known the respondent since 1954.

Young C. Shin, M.D. (no relative), an otolaryngologist who practices in Havre de Grace.

T. Edgie Russell, M.D., an obstetrician/gynecologist since 1946.

Kathy Stewart, R.N., whose children have seen respondent for seventeen years.

Peggy Orlick, R.N., whose children see respondent.

Kathy Thomas, a kindergarten aide who has used the respondent's pediatric services since 1977.

Joann Santos, M.D., a pediatrician who regularly refers her patients to the respondent.

On September 20, 1989, the hearing officer submitted the proposed findings of fact, conclusions of law, and recommendations (recommended decision) to the respondent and the state. Pursuant to State Government Article, §10-212, the parties were advised of their right to file exceptions and make oral argument on exceptions to the board. By letter dated November 6, 1989, the board notified the parties that it had received no exceptions and that the board would consider the recommended decision at its November 22, 1989 meeting. The board reviewed the recommended decision on November 22, 1989. The board postponed consideration of the recommended decision until Wednesday, December 13, 1989. At that meeting, on an affirmative vote of a majority of its full authorized membership, the board decided as follows and issues this sixteen page final order and decision.

Findings of fact as to the charges

The board finds based on the testimony and exhibits introduced at the hearing, by clear and convincing evidence, that

1. At all times relevant, respondent was licensed to practice medicine in Maryland and was practicing as a pediatrician.
2. The respondent pled guilty to Medicaid fraud in violation of Article 27, §230C pursuant to criminal information #28736403 in *State of Maryland v Sang Kyun Shin*, on December 30, 1987. On that date, the court's verdict was guilty on count 1 of the criminal information (State exhibits 1 through 6).
3. On December 30, 1987, respondent was placed on two

Board of Physician Quality Assurance Actions

years of supervised probation under Article 27, §641, received a fine of \$10,000, and was ordered to pay restitution in the amount of \$8,272.50 to the Department of Health and Mental Hygiene.

4. The time for filing an appeal to set aside respondent's guilty plea and conviction has passed.
5. Respondent admitted to acts sufficient to support the plea accepted by the criminal court.
6. The respondent was audited on his Medicaid billings by representatives of the Medicaid Fraud Unit. Twenty bills were found where the respondent had not seen the patient on the particular occasion for which he had been billed.
7. Medicaid fraud is a crime of moral turpitude that involves willfully submitting false reports in the practice of medicine.

Conclusions of law

By clear and convincing evidence, the board concludes as a matter of law that respondent committed the following act:

... pleads guilty ... to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside; §14-504(6)¹

By clear and convincing evidence the board concludes as a matter of law that respondent did not commit the following acts:

Is ... convicted ... by a court of any state or country for an act that would be grounds for disciplinary action under this section [HO §14-504(22)];

Is guilty of immoral or unprofessional conduct in the practice of medicine [HO §14-504(3)];

Willfully makes or files a false report or record in the practice of medicine [HO §14-504(12)].²

Facts as to the sanction

1. The respondent testified that he arrived in his present circumstances because, when he was audited and the twenty cases were called to his attention, he sought the advice of counsel. Counsel informed him that he might either make a plea bargain with the state or he might

contest the case. If he contested the case, the fee would be in the range of \$50,000 to \$60,000. If he plea bargained, however, the criminal offense on his record would do him no harm and the Commission on Medical Discipline, which was the predecessor to the present board, could be accurately predicted to take no action against his license since it never took action against anyone's license in Medicaid fraud cases, even where the fraud was in excess of a half million dollars. The respondent accepted the advice of his counsel and entered into a plea bargain without contesting the state's factual allegations whereupon the law promptly changed, a new board was established, and a new, much firmer policy was instituted with regard to Medicaid fraud. The respondent's discussion of his legal tactical situation is believable, but does not either alter the fact that he had pled guilty to Medicaid fraud.

2. Respondent admitted that he did send requests for Medicaid payment on twenty occasions spread over three years when the patients were repeated "no shows." The total submittal over three years amounts to \$335. Respondent did not fake treatment notes for these occasions, but annotated the histories to show that the patients did not keep their appointments.
3. The respondent has a reputation for being a dedicated, hard working, very competent pediatrician. The respondent was portrayed by the witnesses previously identified as being totally dedicated and extremely capable in his practice. He immerses himself in his practice and his family and little else. He is available at all times to his patients. If the telephone rings at a medical conference, it is a standing joke that the call is probably for the respondent. The respondent was praised in the strongest terms by persons ranging from the stature of Dr. Russell through various kinds of health care professionals and lay witnesses. All perceived him as being uncompromisingly honest, hard working, careful, and caring. None saw him as having any potential for committing a deliberate fraud. Dr. Russell recommended him for his present practice and remains firmly supportive. Other pediatricians and health care providers entrust their children to the respondent. All witnesses were impressive. All spoke with conviction and believed in their testimony.
4. The respondent testified on his own behalf and was also believable. Dr. Shin makes well over \$100,000 per year and has no need to defraud the government of \$335 spread over a three-year period. The facts support his version, that in frustration with persons who were multiple no shows he sent off these requests for payment, feeling that somehow he and his people should be at least compensated for staying the extra hours to try to help people who then did not show and did not have the courtesy to call. Regardless, a case of fraud has been made out; the respondent's conduct amounts to a serious lapse in judg-

1. In reaching this decision, the board notes that respondent's counsel contended that the criminal court, by its issuance of probation before judgment overturned respondent's plea of guilty so that there is no such plea now in existence and the board, therefore, does not have jurisdiction to sanction respondent under §14-504(6) which provides, in pertinent part, "is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude" The board adopts the hearing officer's conclusion as set forth in the addendum.

2. Respondent was given probation prior to judgment under Article 27, §641. Probation prior to judgment is not a conviction. *Myers v State*, 303 Md. 639, 496 A.2d 312 (1988). Consequently this charge and the underlying grounds must be dismissed. (1985); *State v. Shilling*, 75 Md. App. 233, 540 A.2d 1184

Board of Physician Quality Assurance Actions

ment resulting in his plea of guilty and the imposition of probation before judgment.

5. The respondent has made restitution to the Department of Health and Mental Hygiene in the amount in excess of \$8,272.50 as directed by the criminal court, has paid the court costs assessed in the amount of \$95, and has further paid the fine assessed of \$10,000, for a total payment of \$18,367.50.

Order

By a majority of the full authorized membership of the board considering this case, it is this 16th day of January 1990 hereby

ORDERED, that respondent's license is SUSPENDED; and it is further

ORDERED, that said suspension is IMMEDIATELY STAYED pending respondent's compliance with the following condition: That respondent will indicate in all medical records the reasons for ordering a throat culture; and be it further

ORDERED, that on or about June 1, 1991, respondent will submit to a peer review of his practice to determine if he has met the condition of probation; and be it further

ORDERED, that on or about January 16, 1992, respondent may petition the board to lift the suspension on his license; and be it further

ORDERED, that the following charge and underlying grounds

Is ... convicted ... by a court of any state or country for an act that would be grounds for disciplinary action under this section [HO §14-504(22)];

Grounds for disciplinary action under this section are

Is guilty of immoral or unprofessional conduct in the practice of medicine [HO §14-504(3)];

Willfully makes or files a false report or record in the practice of medicine [HO §14-504(12)];

are DISMISSED; and be it further

ORDERED, that this is a final order and as such is considered a public document pursuant to State Government Article of the *Annotated Code of Maryland*, §§10-611 *et seq.*

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Notice of appeal

Pursuant to §14-508(b), Health Occupations article, *Annotated Code of Maryland*, any person aggrieved by a final decision of the board under HO §14-504 of this subtitle, may not appeal to the secretary or to the board of review, but may take a direct judicial appeal. The appeal shall be provided for judicial review of final decisions in the Administrative Procedure Act and Maryland B Rules of Procedure.

ISRAEL H. WEINER, M.D., Chairperson
Maryland Board of Physician Quality Assurance

Addendum

I. Jurisdictional argument

The judge in the respondent's criminal case did not overturn his plea of guilty by entering probation before judgment, and, therefore, the board has jurisdiction to act against the respondent and his license.

The respondent pled guilty to Medicaid fraud in violation of *Maryland Annotated Code*, Article 27, §230C (1987 replacement volume), in the circuit court for Baltimore City. The judge imposed probation before judgment pursuant to *Maryland Annotated Code*, Article 27, §641 (1987 replacement volume). If the judge's action had had the affect of overturning the plea, the board would actually have no jurisdiction in the present case. This is because jurisdiction in the present case is predicated upon the existence of a plea of guilty as contemplated by the Health Occupations Article, §14-504(6), which authorizes the board to take disciplinary action if a licensee

Is convicted of or pleads guilty to or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside.

It is undisputed that the respondent pled guilty to a crime, so the remaining question is whether the plea remained in existence after the judge took his action. The judge acted pursuant to *Maryland Annotated Code*, Article 27, §641 (1987 replacement volume), which provides in pertinent part:

(a)(1)(i) Whenever a person accused of a crime pleads guilty or *nolo contendere* or is found guilty of an offense, a court exercising criminal jurisdiction, if satisfied that the best interests of the person and the welfare of the people of the state would be served thereby, and with the written consent of the person after determination of guilt or acceptance of a *nolo contendere* plea, may stay the entering of judgment, defer further proceedings, and place the person on probation subject to reasonable terms and conditions as appropriate

It is clear that the judge granted probation before judgment as an act of judicial mercy. He was empowered to do this by the existence of a plea of guilty on the part of the respondent. Without the plea of guilty, he would have had no authority to enter probation before judgment, and would have had to try the case to a conclusion.

It is clear that the plea of guilty continues to exist in the criminal court since §641(b) also provides

Upon violation of a term or condition of probation, the court may enter judgment and proceed with disposition of the person as if the person had not been placed on probation.

If the court is empowered to enter judgment upon violation of a term or condition of probation, it must do so based upon a pre-existing plea of guilty as in the present case. If it were not so, the court would have no basis for entry of the guilty verdict and judgment in the event of a violation of the terms of probation.

Board of Physician Quality Assurance Actions

II. Statutory authority

Maryland Health Occupations Code Annotated, §14-504.

Denials, reprimands, probations, suspension, and revocations
— Grounds.

- (a) Subject to the hearing provisions of §14-505 of this subtitle, the board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee
 - (3) Is guilty of immoral or unprofessional conduct in the practice of medicine;
 - (11) Willfully makes or file a false report or record in the practice of medicine.

Maryland Health Occupation Code Annotated, §14-505. —
Hearings.

- (a) Except as otherwise provided in the administrative Procedure Act, before the board takes any action under §14-504 of this subtitle or §14-303, §303.1, or §14-303.2 of this title, it shall give the individual against whom the action is contemplated an opportunity for a hearing before a hearing officer.
- (b) The hearing officer shall give notice and hold the hearing in accordance with the Administrative Procedure Act except that factual findings shall be supported by clear and convincing evidence.
- (c) The individual may be represented at the hearing by counsel.
- (e) After performing any necessary hearing under this section, the hearing officer shall refer proposed factual findings to the board for the board's disposition. ■

THE TEST OF PROFESSIONAL LIABILITY COVERAGE ISN'T WHEN YOU BUY IT.

Now Maryland physicians can get coverage from the carrier that offers a

**IT'S WHEN
YOU USE IT.**

stronger support system at the critical time of need than any other company serving the region.

The carrier is the successful physician-owned National Capital Reciprocal Insurance Company: NCRIC.

The leading professional liability carrier in D.C. now comes to Maryland offering unique approaches to service and protection, all at Maryland rates.

For example, you'll be assigned your own NCRIC claims representative who serves substantially fewer clients

than reps with other carriers. So, in claims and underwriting, you'll get

faster, more personal attention to any question or problem, minor or major.

NCRIC also offers especially attractive coverages for physicians just starting a practice, those practicing in

two or more jurisdictions (D.C., MD, VA), part-time practitioners, and physicians who take maternity leave.

Learn more about the ways NCRIC demonstrates a sensitivity to the needs of the medical community in ways no other carrier does. Call (301) 424-8136.

NEW INDICATION

ONLY ONE H₂-ANTAGONIST HEALS REFLUX ESOPHAGITIS AT DUODENAL ULCER DOSAGE. ONLY ONE.

Of all the H₂-receptor antagonists, only Axid heals and relieves reflux esophagitis at its standard duodenal ulcer dosage. Axid, **150 mg b.i.d.**, relieves heartburn in **86%** of patients after one day and **93%** after one week.¹

AXID[®]
nizatidine
150 mg b.i.d.

ACID TESTED. PATIENT PROVEN.

AXID®

nizatidine capsules

Brief Summary. Consult the package insert for complete prescribing information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to 8 weeks of treatment at a dosage of 300 mg h.s. or 150 mg b.i.d. Most patients heal within 4 weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a dosage of 150 mg h.s. at bedtime. The consequences of therapy with Axid for longer than 1 year are not known.

3. *Gastroesophageal reflux disease (GERD)*—for up to 12 weeks of treatment of endoscopically diagnosed esophagitis, including erosive and ulcerative esophagitis, and associated heartburn at a dosage of 150 mg b.i.d.

Contraindication: Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H₂-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H₂-receptor antagonists.

Precautions: General—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix® may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chloridazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a 2-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in 1 fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in 1 fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Worldwide, controlled clinical trials included over 6,000 patients given nizatidine in studies of varying durations. Placebo-controlled trials in the United States and Canada included over 2,600 patients given nizatidine and over 1,700 given placebo. Among the adverse events in these placebo-controlled trials, only anemia (0.2% vs 0%) and urticaria (0.5% vs 0.1%) were significantly more common in the nizatidine group. Of the adverse events that occurred at a frequency of 1% or more, there was no statistically significant difference between Axid and placebo in the incidence of any of these events (see package insert for complete information).

A variety of less common events were also reported; it was not possible to determine whether these were caused by nizatidine.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to 3 times the upper limit of normal, however, did not significantly differ from that in placebo patients. All abnormalities were reversible after discontinuation of Axid. Since market introduction, hepatitis and jaundice have been reported. Rare cases of cholestatic or mixed hepatocellular and cholestatic injury with jaundice have been reported with reversal of the abnormalities after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in 2 individuals administered Axid and in 3 untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of anti-androgenic activity due to nizatidine. Impotence and decreased libido were reported with similar frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Anemia was reported significantly more frequently in nizatidine than in placebo-treated patients. Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H₂-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Urticaria was reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H₂-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. The ability of hemodialysis to remove nizatidine from the body has not been conclusively demonstrated; however, due to its large volume of distribution, nizatidine is not expected to be efficiently removed from the body by this method. Maryland Metabolic Institute Announces Their New Location and Continuation of Services

A new strategy to improve patient care

*We help the physician
by helping the patient
help themselves*

Health can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

Training Programs Include:

Diabetes Education

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

Behavior Modification

- weight reduction and maintenance
- modified fasting: Optifast
- limited diets: Optitrim
- full food control: LEARN®
- stress management

Dietary Counseling

- all medical disorders

Call for an appointment or further information or have patients schedule a consultation.

MMI Diabetes Center* (301) 296-0025
MMI Optifast® Weight Reduction and Maintenance Program (301) 494-8338**

A Clinical Moment With...Diabetes

When are sulfonylurea drugs worth a trial?

Doctor, I am a 55-year-old woman and have had diabetes for ten years. I weigh 170 lbs and for my height of 61 inches, my weight should be between 110 and 120 lbs. Since the onset of my diabetes, I have seen several physicians and they all treat me the same. First I am given one sulfonylurea drug. After a few months, another is prescribed. This continues for about one year. Finally, the doctor wants to start insulin, saying the oral agents are ineffective in my situation. That is when I change to another physician and go through the same routine. My weight stays the same. The doctors have given me meal plans to follow but I do not understand them. My husband fusses with me to do something about the diabetes before I get foot complications and lose a leg as my mother did. Isn't there one sulfonylurea drug that is potent enough to control my diabetes without my having to use insulin? Is there a simple meal plan that I can understand?

The most important steps to take with patients with this type of problem are to take time to sit down and talk, take a good diet history and a good social history, and construct a meal plan that they understand and can live with. In addition, a good diabetes education program, including further diet instruction and the reading and understanding of package labeling, is essential. Patients need to know why the sulfonylurea drugs were used and why they probably failed, as well as why insulin was recommended and why it should be accepted as the best form of therapy when the blood glucose cannot be controlled by meal plan and sulfonylurea therapy. If patients attend a good diabetes education program, there will be no need to change physicians every time the use of insulin is suggested. If the spouse appears to be appreciative of a patient's needs, the spouse should be included in the education program.

In fairness to the physicians who treated this woman, there are some patients who have no desire to participate in a diabetes education program; no progress can be made if help is not accepted. Sometimes, however, when a patient history is taken or previous meal plans are reviewed, not enough effort is put forth by physicians and their staffs. Sulfonylurea drugs are indicated in noninsulin-dependent diabetic patients who cannot be managed by diet alone. However, a diet acceptable to the patient should be tried with all overweight, nonketotic, diabetic patients for at least three months before

the use of a sulfonylurea drug is suggested. The sulfonylurea drug should be used in addition to the diet and not instead of it.

Which sulfonylurea drug should be used depends on the physician and the patient. Tolbutamide is the least potent; tolazamide, glipizide, and glyburide are somewhat more potent; and chlorpropamide is the most potent, based on Food and Drug Administration dosage schedules. All these drugs have remarkably few side effects. The possibility of a disulfiram effect should be called to the attention of the patient. This effect can be used beneficially in those patients who consume too much alcohol. The other effect noted in patients who eat irregularly or who use excessive amounts of alcohol is hypoglycemia; changing the patient's habits or dose reduction is the needed treatment. Hyponatremia, often mentioned as a complication of chlorpropamide therapy, is rare and, when seen, is almost always related to concomitant diuretic or other drug therapy. Patients using sulfonylurea drugs should be seen in the office every two to three months depending on the degree of control achieved. Physicians should become very familiar with one of the sulfonylurea drugs and use it almost exclusively. Changing from one to another is usually not worthwhile.

If diet and sulfonylurea therapy fail to control the hyperglycemia, insulin therapy is essential. If the reasons for the change in therapy are understood, the change will be accepted in the vast majority of patients.

Primary failure of a sulfonylurea drug occurs in situations in which a noninsulin-dependent patient does not show a blood glucose drop with a maximum acceptable dose of the drug after one month of treatment. Primary failure occurs in about 20 percent of patients and the cause is unknown.

Secondary failure of sulfonylurea drugs occurs in patients who respond to therapy for two or more months and then do not respond. In a large series of patients, secondary failure will occur at a rate of about 2 percent per month. The author has followed several patients successfully on sulfonylurea therapy for over fifteen years.

The University Group Diabetes Program of twenty years ago showed that diet and exercise therapy were inadequately used in the management of most noninsulin-dependent diabetic patients.

DEWITT E. DELAWTER, M.D.
Editor

A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESSTM MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201-5585
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

INFORMATION FOR AUTHORS INFO

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201-5585. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references), with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a WordPerfect or ASCII format.

Include full name of author(s) with highest degrees and academic or professional titles.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

An introductory synopsis of approximately twenty-five to fifty words is required.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in the text. The number of references generally is limited to twenty in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permission: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Page proofs will be mailed to the principal or corresponding author and, if not returned by the specified date, will be considered approved as typeset. ■

PHYSICIANS WANTED

Semi-retired or retired physicians for pleasant office practice part-time. Call 547-2686.

INTERNIST

Busy office of internists in Baltimore County looking for BE/BC internist for association. Reply to Box 5.

ORTHOPAEDIC SURGEON

BC/BE to join 4 orthopaedists in a large multispecialty group. Extensive support system and modern facility located in Columbia, near the cultural advantages and medical schools of the Baltimore-Washington, DC area. Competitive salary, excellent benefits. Please direct CVs to: Patuxent Medical Group, Inc., 2 Knoll North Drive, Columbia, MD 21045. Attn: Physician Recruiter. EOE M/F/H/V.

PHYSICIAN WANTED

Family Practice. Part-time 20-30 hours per week; Flexible; Salary negotiable. Call 301-972-0400 or evenings at 301-340-2289.

PART-TIME PEDIATRIC PRECEPTORS

Sinai Hospital of Baltimore is now hiring part-time Pediatric Preceptors to work in the Emergency Room. For more information, please call Susan Moriarty, M.D. at 410-578-5737.

PEDIATRICIAN

Pediatric Specialty and Rehabilitation Hospital is recruiting for a full-time attending physician to join medical team of Continuing Care Program dedicated to the management of chronic illnesses in children from infancy to age 18. Under the direction of the Clinical Program Director, will provide medical na case management services to severely neurologically impaired patient population. Must be an accredited medical school graduate, MD licensed, and Board certified in Pediatrics. A minimum of 2 yrs. clinical experience pre-ferred. Competitive compensation and benefits package. Call for additional information or send you CV to: Beryl Rosenstein, M.D., Medical Director, Mt. Washington Pediatric Health System, Inc., 1708 West Rogers Ave., Baltimore, MD 21209. 410-578-8600, ext. 301. EOE.

INTERNAL MEDICINE

Baltimore area busy Internal Medical group practice looking for third board certified/board eligible Internist. Excellent practice opportunity, great location. Send CV to K. Glick, M.D., 20 Crossroads Drive, Suite 12, Owings Mills, MD 21117.

INTERNIST/FAMILY PRACTITIONER

Bd. Cert. or Bd. eligible, full-time for HMO facility in Catonsville area. Challenging environment with exc. benefits and salary. Contact Dianne McLean at 876-9680.

AMA LOCUM TENENS SERVICE

Increasing numbers of physicians across the country are choosing to work as locum tenens because of the benefits offered through this style of practice—freedom with financial security, professional and personal challenge, adventure, and travel. Many physicians relish the freedom that locum tenens positions allow them. It is an ideal situation for those who enjoy travelling, continually meeting new people, and encountering challenges. They are relieved from the burden of practice management and the responsibilities of owning their own practice. Locum tenens have more time to concentrate on matters of personal interest. For more information on AMA Locum Tenens Service, call 1-800-955-3565.

MEDICAL OFFICE

Suitable for 1 or 2 physicians: St. Mary's County, a rapidly growing, semirural area. Contact Leon Berube for details: 997 Old Route Five, Mechanicsville, MD 20659 (301-884-3113).

PROFESSIONAL OFFICE SUITE

Towson (Y21204SIS) 2nd fl cor. suite, good windows, 9 rms consisting of 3 exam rms, lab area with plumb, 2 handicapped rstrm. \$279,000. A. O'Ferrall 823-2323/828-9076. O'Connor Piper & Flynn. EHO.

DIFFICULT DECISIONS

An Older Person Exhibits The Following Psychopathology:

1. Depression, Bizarre Behavior, Schizophrenia
2. Severe Anxiety, Mania, Functional or Organic Psychoses
3. Impulsivity, Eating Disorders, Severe Obsessions/Compulsions
4. Addictions in Conjunction with Other Psychiatric Disorders

What Is An Effective Therapeutic Response?

The Geropsychiatric Program At Taylor Manor Hospital

In response to the growing population of older persons who suffer from a treatable mental illness, Taylor Manor Hospital announces the expansion of our Geropsychiatric Program. Now, older patients who may have reversible dementia, affective disorder, depressive illness and addictions accompanied by psychiatric symptoms, will benefit from the comprehensive assessment and treatment provided by our multi-disciplinary team of geriatric specialists.

Admission criteria to the Geropsychiatric Program are as follows: patients must be age 65 or older (unless suffering from premature pathological aging), must exhibit moderate to severe emotional, behavioral, intellectual, or neurological impairment, or pose a danger to themselves and/or others. Length of stay depends upon the nature of the illness and responsiveness to treatment.

Each patient receives highly individualized attention through individual and group therapy, as well as educational groups and an array of multi-modal programs addressing specific problems. The referring professional is closely consulted at every stage of therapy -- including the initial consultation and our in-depth diagnostic evaluation -- to ensure that the individual is placed in the most appropriate treatment setting. Taylor Manor Hospital also provides specialized medical attention, if needed, through agreements with local hospitals, following consultation with the referral source.

Aftercare treatment is coordinated by a staff social worker, in close cooperation with the referring professional. Because of the importance we place on effective continuity of care, our affiliated network of conveniently located outpatient treatment centers (Taylor Mental Health Services), is available to patients after discharge at the discretion of the referring professional. Our common goal is to restore seniors to their maximum emotional well-being, by providing personal support and practical help in an atmosphere of consideration, respect, and caring.

For the many faces of mild hypertension

THE MOST WIDELY USED CALCIUM ANTAGONIST AS MONOTHERAPY FOR MILD HYPERTENSION^{1*}

- Effective 24-hour control²
- Single-agent efficacy
- Well tolerated[†]
- No adverse effects on total cholesterol, plasma glucose levels, renal function,^{*} or serum electrolytes³⁻⁶

For the many faces of mild hypertension

*The recommended starting dose for Calan SR is 180 mg once daily. Dose titration will be required in some patients to achieve blood pressure control. A lower initial starting dosage of 120 mg/day may be warranted in some patients (eg, the elderly, patients of small stature). Dosages above 240 mg daily should be administered in divided doses. Calan SR should be administered with food.

†Constipation, which is easily managed in most patients, is the most commonly reported side effect of Calan SR.

*Verapamil should be administered cautiously to patients with impaired renal function.

BRIEF SUMMARY

Contraindications: Severe LV dysfunction (see *Warnings*), hypotension (systolic pressure < 90 mm Hg) or cardiogenic shock, sick sinus syndrome (if no pacemaker is present), 2nd- or 3rd-degree AV block (if no pacemaker is present), atrial flutter/fibrillation with an accessory bypass tract (eg, WPW or LGL syndromes), hypersensitivity to verapamil.

Warnings: Verapamil should be avoided in patients with severe LV dysfunction (eg, ejection fraction < 30%) or moderate to severe symptoms of cardiac failure and in patients with any degree of ventricular dysfunction if they are receiving a beta-blocker. Control milder heart failure with optimum digitalization and/or diuretics before Calan SR is used. Verapamil may occasionally produce hypotension. Elevations of liver enzymes have been reported. Several cases have been demonstrated to be produced by verapamil. Periodic monitoring of liver function in patients on verapamil is prudent. Some patients with paroxysmal and/or chronic atrial flutter/fibrillation and an accessory AV pathway (eg, WPW or LGL syndromes) have developed an increased antegrade conduction across the accessory pathway bypassing the AV node, producing a very rapid ventricular response or ventricular fibrillation after receiving I.V. verapamil (or digitalis). Because of this risk, oral verapamil is contraindicated in such patients. AV block may occur (2nd- and 3rd-degree, 0.8%). Development of marked 1st-degree block or progression to 2nd- or 3rd-degree block requires reduction in dosage or, rarely, discontinuation and institution of appropriate therapy. Sinus bradycardia, 2nd-degree AV block, sinus arrest, pulmonary edema and/or severe hypotension were seen in some critically ill patients with hypertrophic cardiomyopathy who were treated with verapamil.

Precautions: Verapamil should be given cautiously to patients with impaired hepatic function (in severe dysfunction use about 30% of the normal dose) or impaired renal function, and patients should be monitored for abnormal prolongation of the PR interval or other signs of overdosage. Verapamil may decrease neuromuscular transmission in patients with Duchenne's muscular dystrophy and may prolong recovery from the neuromuscular blocking agent vecuronium. It may be necessary to decrease verapamil dosage in patients with attenuated neuromuscular transmission. Combined therapy with beta-adrenergic blockers and verapamil may result in additive negative effects on heart rate, atrioventricular conduction and/or cardiac contractility; there have been reports of excessive bradycardia and AV block, including complete heart block. The risks of such combined therapy may outweigh the benefits. The combination should be used only with caution and close monitoring. Decreased metoprolol and propranolol clearance may occur when either drug is administered concomitantly with verapamil. A variable effect has been seen with combined use of atenolol. Chronic verapamil treatment can increase serum digoxin levels by 50% to 75% during the first week of therapy, which can result in digitalis toxicity. In patients with hepatic cirrhosis, verapamil may reduce total body clearance and extrarenal clearance of digoxin. The digoxin dose should be reduced when verapamil is given, and the patient carefully

monitored. Verapamil will usually have an additive effect in patients receiving blood-pressure-lowering agents. Disopyramide should not be given within 48 hours before or 24 hours after verapamil administration. Concomitant use of flecainide and verapamil may have additive effects on myocardial contractility, AV conduction, and repolarization. Combined verapamil and quinidine therapy in patients with hypertrophic cardiomyopathy should be avoided, since significant hypotension may result. Concomitant use of lithium and verapamil may result in a lowering of serum lithium levels or increased sensitivity to lithium. Patients receiving both drugs must be monitored carefully. Verapamil may increase carbamazepine concentrations during combined use. Rifampin may reduce verapamil bioavailability. Phenobarbital may increase verapamil clearance. Verapamil may increase serum levels of cyclosporin. Verapamil may inhibit the clearance and increase the plasma levels of theophylline. Concomitant use of inhalation anesthetics and calcium antagonists needs careful titration to avoid excessive cardiovascular depression. Verapamil may potentiate the activity of neuromuscular blocking agents (curare-like and depolarizing); dosage reduction may be required. There was no evidence of a carcinogenic potential of verapamil administered to rats for 2 years. A study in rats did not suggest a tumorigenic potential, and verapamil was not mutagenic in the Ames test. Pregnancy Category C. There are no adequate and well-controlled studies in pregnant women. This drug should be used during pregnancy, labor, and delivery only if clearly needed. Verapamil is excreted in breast milk; therefore, nursing should be discontinued during verapamil use.

Adverse Reactions: Constipation (7.3%), dizziness (3.3%), nausea (2.7%), hypotension (2.5%), headache (2.2%), edema (1.9%), CHF, pulmonary edema (1.8%), fatigue (1.7%), dyspnea (1.4%), bradycardia: HR < 50/min (1.4%), AV block: total 1°, 2°, 3° (1.2%), 2° and 3° (0.8%), rash (1.2%), flushing (0.6%), elevated liver enzymes, reversible non-obstructive paralytic ileus. The following reactions, reported in 1.0% or less of patients, occurred under conditions where a causal relationship is uncertain: angina pectoris, atrioventricular dissociation, chest pain, claudication, myocardial infarction, palpitations, purpura (vasculitis), syncope, diarrhea, dry mouth, gastrointestinal distress, gingival hyperplasia, ecchymosis or bruising, cerebrovascular accident, confusion, equilibrium disorders, insomnia, muscle cramps, paresthesia, psychotic symptoms, shakiness, somnolence, arthralgia and rash, exanthema, hair loss, hyperkeratosis, macules, sweating, urticaria, Stevens-Johnson syndrome, erythema multiforme, blurred vision, gynecostasia, galactorrhea/hyperprolactinemia, increased urination, spotty menstruation, impotence.

When you choose Princeton, you're in good company.

"One thing I really like is the approach Princeton takes toward defending claims. Princeton follows a policy of taking defensible cases to court, instead of settling just to avoid the hassle of dealing with a case. I think that's a wonderful way to handle frivolous claims."

*Dr. Dwight Fortier
Pediatrician, Annapolis*

More than 90% of
Princeton-managed cases

It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Assembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESSTM MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Accessible MRI of Baltimore County, Inc., we make it easier for you to diagnose your patients' problems.

JUNE 1992

VOLUME 41 NO 6

- The development of biomedical science under Dean John M. Dennis, M.D.** 493
Benjamin F. Trump, M.D.
- Comments on John M. Dennis, M.D.** 495
Donald E. Wilson, M.D.
- John M. Dennis, M.D., Dean of the University of Maryland School of Medicine: 1973–1990** . . . 497
Richard D. Richards, M.D. and Benjamin F. Trump, M.D.
 John M. Dennis, M.D. was dean of the University of Maryland School of Medicine for 17 years. His numerous accomplishments in that role will have a positive effect on the future of the School of Medicine for years to come.
- Endogenous ouabain: Implications for cardiovascular disease diagnosis and therapy** 501
Mordecai P. Blaustein, M.D. and John M. Hamlyn, Ph.D.
 The remarkable discovery that ouabain (endogenous digitalis) is a hormone produced by the adrenal cortex raises important questions about the physiological actions of this substance and its role in the pathogenesis and therapy of cardiovascular diseases.
- The role of ionized cytosolic calcium ($[Ca^{2+}]_i$) in injury and recovery from anoxia and ischemia** . . 505
Benjamin F. Trump, M.D.; Irene K. Berezsky, B.A.; Mary W. Smith, M.S.; and Patricia C. Phelps, A.B.
 Cellular reaction to deprivation of oxygen and/or lack of substrate perfusion due to altered blood flow can be categorized in three phases: initiation, reversible, and irreversible or recovery.
- Human injuries following jellyfish stings** 509
Joseph W. Burnett, M.D.
 There are approximately 500,000 jellyfish stings every year in the Chesapeake Bay. Dr. Burnett describes the mechanism of jellyfish stings, venom components, types of reactions, diagnosis, and therapy.
- The supportive care unit—Inpatient geriatric rehabilitation: Preliminary data** 515
Mel P. Daly, M.D.; Alan M. Adelman, M.D.; and Barbara M. Resnick, R.N., M.S.N., C.R.N.P.
 Hospital availability of a comprehensive geriatric rehabilitation service, such as the Supportive Care Unit at the University of Maryland, can help achieve the goals of preserving present levels of function, avoiding losses of function, and restoring independence in the frail elderly.
- Unusual articular manifestations in chronic renal disease** 519
Charles S. Resnik, M.D.; Bruce I. Reiner, M.D.; and Jeremy W. R. Young, M.D.
 We report thirteen patients with chronic renal disease who demonstrate one or more sites of arthropathy including three with combined spine and shoulder changes.
- Chorionic villus sampling: The University of Maryland experience** 523
W. Allen Hogge, M.D.; Joan S. Hogge, M.S.; C. Lynn Keene, M.D.; Marcos Pupkin, M.D.; Stuart Schwartz, Ph.D.; Colleen McGillis, M.S.; Christine Hartlove, B.S.; Carlyle Crenshaw, Jr., M.D.; and Maimon M. Cohen, Ph.D.
 The University of Maryland was the first program in the state to offer chorionic villus sampling (CVS). Since

the program's beginning in 1984, 998 patients have been seen with successful sampling in 99.1 percent, using both transcervical and transabdominal approaches. The overall loss rate was quite low (2.3 percent), and no increased risk of birth defects was seen. These observations demonstrate that CVS provides a safe and accurate alternative to amniocentesis.

Hemoglobin as oxygen carrier in cell-free fluids 527

Enrico Bucci, M.D., Ph.D. and Clara Fronticelli, Ph.D.

The University of Maryland is studying the oxygen needs of internal organs and how these needs can be met by oxygen carriers in cell-free fluids. Once developed, cell-free oxygen carriers will have a large variety of applications including hemodilution, transfusion therapy, organ preservation, and cancer therapy.

A new concept of hemorrhagic shock:

Implications for therapy 533

Donald S. Gann, M.D. and John A. Evans, Ph.D.

Although historically shock has been viewed in terms of circulatory failure, in recent times, the defect in shock has been thought to result from a failure of oxygen delivery.

Dr. Dennis, dean emeritus of the University of Maryland School of Medicine, stands before an architectural model of the new VA Medical Center, an endeavor planned during his tenure, while behind him the structure takes shape.

Cover photo and design by Virginia Carter

Maryland's newest physical rehab center already has 20 years experience.

Baltimore is a city known internationally for its outstanding medical care. Now the tradition continues with the addition of the new Maryland General-Bryn Mawr Rehab Center at Maryland General Hospital. This specialty center for physical medicine and rehabilitation offers Bryn Mawr Rehab's 20 years of experience and leadership in the field of rehabilitation medicine.

The partnership between Maryland General Hospital and Bryn Mawr Rehab is truly unique. For the first time in Maryland, two high quality institutions with long histories of health care achievement are coming together to make a major commitment to rehabilitation medicine.

The Maryland General-Bryn Mawr Rehab Center, the region's most modern and conveniently located rehabilitation facility, provides a continuum of care in physical and cognitive rehabilitation services

including brain injury, stroke, orthopedics, arthritis, amputee services and multiple sclerosis, among others.

Most importantly, everyone on the Maryland General-Bryn Mawr Rehab team is personally and professionally dedicated to helping patients reach their highest level of independence. Our guiding philosophy is team-centered care, focused upon the individual needs of our patients and their families. This is what makes Maryland General-Bryn Mawr Rehab Center a very special place for rehabilitation care.

To learn more about Maryland General-Bryn Mawr Rehab Center or to arrange a tour, please call Mary Filippelli our administrative director at (301) 225-8380.

IF YOU'RE LOOKING FOR A LUXURY HOME, LOOK FOR ONE THAT'S AFFORDABLE.

RIVER FALLS
Potomac's Family Community.

From a strictly financial aspect, River Falls homes have performed admirably. Through the ups and downs over the past 23 years, they've posted a track record of significant appreciation and lasting durability. Marketability that's a testament to timeless designs, construction by teams of in-house craftsmen, and one of the most beautiful, convenient locations in the Potomac/Bethesda area.

Today, a River Falls home is still an eminently affordable investment and a smart one too. Four-to-six bedrooms start in the \$600's with absolutely no compromise in quality. There's terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go well beyond dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs. Nearby are excellent public and private schools, convenient shopping and easy access to suburban Maryland, downtown D.C., and Northern Virginia.

Where else can you get such a sound investment with such outstanding returns? Take an hour to visit River Falls and see how great your future can be. For you, and for your family.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.
HOURS: 12-5 daily.

PHONE: (301) 299-3700.

Brokers welcome.

GOSNELL INC.
Clarence W. Gosnell, Incorporated

"My grandfather taught my father and my father taught me."

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities

June 1992

New Med Chi Officers Elected

On May 2, 1992, the Med Chi House of Delegates elected *Joseph Snyder, M.D.* of Silver Spring to the office of president-elect. Dr. Snyder is an ophthalmologist and a member of the Montgomery County Medical Society.

Also during the meeting, *Albert L. Blumberg, M.D.* of Baltimore was elected to the office of treasurer for 1992. Dr. Blumberg specializes in therapeutic radiology and is a member of the Baltimore County Medical Society.

Henry N. Wagner, M.D. and *Roland Smoot, M.D.* were re-elected as delegates to the American Medical Association (AMA). Resident member *Eric Lon Shampaine, M.D.* and student member *Robert Ferris* were elected as alternate delegates to the AMA.

The Med Chi House of Delegates also elected the following physicians to the positions listed below:

Finney Fund Committee—*Susan R. Guarnieri, M.D.*, Baltimore City (5-year term 1993-1998)

Board of Physician Quality Assurance*—*Augusto R. DeLeon, M.D.*; *Hilary T. O'Herlihy, M.D.*, Anne Arundel County; *Mary Newman, M.D.*, Baltimore City; *Sidney B. Seidman, M.D.*, Baltimore County; *Cheryl E. Winchell, M.D.*, Montgomery County; *Israel H. Weiner, M.D.*, Baltimore City

* There are currently three vacancies for 4-year term positions on the Board (6/30/92 to 6/30/96). Faculty bylaws require that Med Chi submit a list of physicians to fill vacancies on the board.

Awards Presented During 1992 Annual Meeting

Clifford Andrew, M.D. was the recipient of the Wyeth Ayerst Laboratories Physician Award for Community Service. Dr. Andrew received the award for his efforts to protect Anne Arundel County's natural resources through the Severn River Association.

Med Chi president *J. David Nagel, M.D.* presented certificates of recognition to the following three physicians for their outstanding service and dedication as chairpersons of Med Chi committees:

Edward J. Kowalewski, M.D., chairperson, Focused Professional Education Committee

Hiroshi Nakazawa, M.D., chairperson, Public Relations Committee

Ronald J. Cohen, M.D., chairperson, Peer Review Management Committee

Dr. Nagel also announced the winners of the 12th Annual Med Chi Photo Contest:

Michael A. McClinton, M.D. —First Place *David Paul, M.D.* —Second Place

Med Chi Student Component Society president *W. David Sullivan* was presented with the Award for Excellence in Organized Medicine in recognition of his outstanding accomplishments.

Dr. Nagel and MMJ Editor *Victor H. Hrehorovich, M.D.* presented commemorative covers of the MMJ to dean emeritus of the University of Maryland School of Medicine, *John M. Dennis, M.D.* (June 1992 cover), and current dean, *Donald E. Wilson, M.D.* (December 1991).

Also during the meeting, Dr. Nagel named Maryland Senate president *Thomas V. "Mike" Miller* as citizen of the year and presented him with the Henry and Page Laughlin Award for Citizenship.

HCFA 1500 Claim Form

Department of Health and Human Services secretary *Louis Sullivan, M.D.* has extended the grace period for using the old HCFA 1500 form until July 1, 1992. However, HCFA is currently accepting the new form and encourages physicians to

begin using it. The revised HCFA 1500 claim forms can be purchased by calling the AMA's Customer Service toll-free number, 1-800-621-8335.

Medicare Coding Update

In February 1992, HCFA instructed carriers to drop the HPBs (historic payment bases) for mycotic nails (procedure codes 11700 - 11711) and instructed carriers to make payments based on the 1992 fee schedule amounts.

Requests for Claim Reviews—Maryland Blue Cross/Blue Shield

Usually, claim reviews require additional information and, therefore, the request for review should be done in writing. In order to ensure quick processing of your inquiry

- Use the Information Request Form (IRF)
- Attach a copy of the claim in question
- Include documentation (medical records, op notes, etc.) that will help to substantiate your request for review
- Do not send a second inquiry until the carrier has responded to the first inquiry

There are times when a telephone inquiry is appropriate to request review of a claim. Listed below are the most frequently requested changes and how they must be handled:

Telephone Request Accepted
Date of Injury (if omitted on claim)
Patient's Birthdate (birth year change)
Date of Service (year change only)
Place of Service Code
Patient's Name

Written Documentation Required
Date of Injury (if changing)
Patient's Birthdate (entire birthdate)
Date of Service (entire date changing)
Date of Service (Vision Claims)
Frequency of Service
Charges
Diagnosis
Procedure Code
Anesthesia Time

*Provider Payment/
Denial Appeal
Process—Maryland Blue
Cross/Blue Shield*

If you disagree with a claim determination and need to have it reviewed, there are three steps to follow. They are

Step 1. CONTACT THE PROVIDER INQUIRY SERVICE DEPARTMENT

By Phone —

If the payment/denial error is obvious and easy to explain, such as an omitted charge or a charge was listed incorrectly, the claim review may be requested by calling the Provider Assistance and Relations Account Team Number.

Account Team Name	Team Code	Name of Acct. Exec.	Local Number	800 Number
INSTITUTIONAL				
Central Maryland	A	Sharon Pettaway	581-3540	800-872-4025

In Writing —

If a corrected claim, operative notes, or pathology reports are necessary, please send these items to: Par Correspondence, P.O. Box 811, Owings Mills, MD 21117. Include any information that will help explain the situation.

Requests for claim reviews must be received within 60 days from the date of the provider voucher.

Step 2. MEDICAL REVIEW

If a provider wishes to appeal the determination resulting from Step 1, a written request should be made for the claim to be reviewed by the Medical Review Department. (Send request to: Par Correspondence, P.O. Box 811, Owings Mills, MD 21117.) Again, pertinent claim information, such as operative notes, pathology reports, and photographs for certain plastic surgeries, should accompany the request for the claim review.

Step 3. REFERENCE AND APPEALS COMMITTEE

If a provider wishes to appeal the determination resulting from Step 2, a written request should be made for the claim to be reviewed by the Reference and Appeals Committee. (Send request to: Par Correspondence, P.O. Box 811, Owings Mills, MD 21117.)

Based on the recommendation by the Subcommittee on Immunizations and Infectious Diseases, Med Chi's Council approved of the recommendation that all infants, regardless of HBsAg status of the mother, should receive hepatitis B vaccination. Hepatitis B vaccine should be incorporated into vaccination schedules for children. The first dose can be administered during the newborn period, preferably before the infant is discharged from the hospital, but no later than when the infant is 2

*Universal Vaccination of
Infants Born to
HBsAg-Negative Mothers*

months of age (Table 1). Because the highest titers of anti-HBs are achieved when the last two doses of vaccine are spaced at least 4 months apart, schedules that achieve that spacing may be preferable (Table 1). However, schedules with 2-month intervals between doses, which conform to schedules for other childhood vaccines, have been shown to produce a good antibody response (Table 1) and may be appropriate in populations in which it is difficult to ensure that infants will be brought back for all their vaccinations. The development of combination vaccines containing HBsAg may lead to other schedules that will allow optimal use of combined antigens.

Special efforts should be made to ensure that high levels of hepatitis B vaccination are achieved in populations in which HBV infection occurs at high rates among children (Alaskan Natives, Pacific Islanders, and infants of immigrants from countries in which HBV is endemic).

Physicians should note that Medical Assistance will pay for the vaccine.

TABLE 1. Recommended schedules of hepatitis B vaccination for infants born to HBsAg* negative mothers

Hepatitis B vaccine	Age of Infant	Hepatitis B vaccine	Age of Infant
Option 1		Option 2	
Dose 1	Birth-before hospital discharge	Dose 1	1-2 months ⁺
Dose 2	1-2 months ⁺	Dose 2	4 months ⁺
Dose 3	6-18 months ⁺	Dose 3	6-18 months ⁺

* HBsAg = Hepatitis B surface antigen.

⁺ Hepatitis B vaccine can be administered simultaneously with diphtheria-tetanus-pertussis, Haemophilus influenzae type b conjugate, measles-mumps-rubella, and oral polio vaccines at the same visit.

(Morbidity and Mortality Weekly Report, Nov. 22, 1991, Vol. 40)

MTA Reduced Fare and Paratransit Program

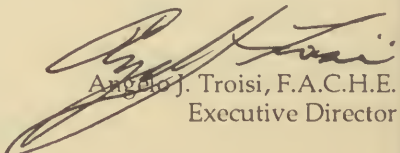

In July 1992, the Mass Transit Administration (MTA) will begin recertifying individuals for its Disability Reduced Fare and Paratransit programs. These programs allow individuals to use MTA services for a reduced fare or to use a special curb-to-curb service if they are unable to make use of main-line transit services. Over the next six to seven months, it is expected that close to 40,000 individuals will be contacting their physicians for assistance in completing the certification applications. The presence of a disability does not automatically qualify a person for the assistance programs; the application must state the degree of disability and how it affects the person's ability to travel. For a booklet describing the exact criteria or for more information, contact Gary Blanchard at 410-333-3360.

Med Chi Physicians Can Access Maryland Elder C.A.R.E.

Beginning July 1, 1992, Med Chi physicians can access Maryland Elder C.A.R.E., a program that recommends options for your elder care needs. The program, which is not available to the general public, offers

- a personalized assessment of your relative's needs by experienced gerontologists
- information on resources for your elderly relative, and
- access to more than 3,000 local and regional gerontological resources.

Med Chi members who use Maryland Elder C.A.R.E. pay a service fee of \$125 for a professional phone consultation. In person consultations are \$95/hour. To use this service, call 1-800-734-7545 and identify yourself as a Med Chi member.

Editorial

Medical education: The role of the *MMJ*

Forty years after its formation in 1799, the Medical and Chirurgical Faculty of Maryland inaugurated the publication of a medical journal "devoted to the interest of medical science," the purpose of which was to contribute to the continuing medical education of physicians in the state. Because of inadequate pecuniary support, the journal suffered a demise in 1843, but resumed publication in 1877. ■ Publication of the journal ceased again in

1918, but was revived in 1952 and exists today as the *Maryland Medical Journal (MMJ)*. Currently, the value of the *MMJ* as a useful tool in continuing medical education, and even the advisability of continuing its publication, is being questioned by some Med Chi members. These are critical issues that the Editorial Board of the *MMJ* must evaluate and act on.

Continuing education is part of the lifestyle for physicians who are constantly striving to improve and expand their medical expertise in the interest of excellent patient care. Various methods for continuing medical education exist, including attendance at lectures, seminars, society meetings, and hospital meetings; the use of audiovisual tapes; and the reading of medical journals. Attending some of these programs of continuing medical education requires significant expense in tuition, travel, and lodging, as well as the loss of practice revenue for physicians who choose to attend the meetings, seminars, courses, and conferences offered. Of course, by virtue of location, some programs offer the additional benefit of a limited vacation.

Medical journals obviate those expenses and have long been a significant way for physicians to continue their education. It is difficult, if not impossible, for a journal to have equal appeal to all physicians at all times, but most physicians have their journal favorites which they read on a regular basis.

In the past several decades, there has been a

virtual explosion in the number of journals available to physicians. Some journals are of a general nature, some are for special interest groups, some are sent freely, and others are sent only by subscription. Included in this selection are journals published monthly by thirty-six of the state medical societies, some of which focus more on legislative or administrative issues than on medicine. All, however, compete for a limited supply of excellent material.

In this expansive array of medical journals, what is the present role of the *MMJ*? I believe that its role should remain essentially the same as was proposed at its beginning—to contribute to the continuing medical education of physicians, particularly those in the state. This was clearly stated by the founding fathers in 1839.

Our course shall be fair and open; our object and desire is to afford another medium through which our junior members, in association with their aged and more experienced brothers, may have an opportunity of spreading before the public the result of their labor and reflections.¹

This can best be done by striving to present information that is accurate, well written, and of use to our readers. In addition, we would like to promote the *MMJ* as a vehicle for local physicians, medical institutions, and medical educators to use in their efforts to provide useful information to the medical community. All prospective authors should be encouraged by the knowledge that their material will be subject to peer review before acceptance and, therefore, can be a legitimate addition to their curriculum vitae.

Perhaps, once again, the intent of your present editorial board can best be expressed by quoting from the "Address of the Editorial Committee" to the membership of the society in 1839.

Of our individual talent for the work we can say nothing; our paper must speak for us in this particular. We, however, pledge our best ability to sustain the undertaking until those who called us to the post shall have an opportunity to pass upon our work, and either continue us in the relation we now hold to them or supersede us by the appointment of others better qualified to meet their views and wishes.

We cheerfully undertake the duties imposed upon us

because we believe that we shall not be left to contend, single-handed, for the object in view. Having a claim for assistance upon our brethren throughout the city, State and United States, we doubt not *they* will *as promptly* meet *that claim* as we have *pledged ourselves* to our work. To them we now make our appeal, confident that it will be responded to with promptness, and the pages of our ensuing numbers enriched by their contributions.¹

Recent issues of the *MMJ* or articles published in the *MMJ* have been sponsored by some of our community hospitals, medical organizations, and medical schools. The University of Maryland is the sponsor of this issue. The editorial board would like to have articles submitted more often from the extensive medical resources and talent in Maryland, to encourage greater utilization of the *MMJ* for publication of the work and experiences of Maryland physicians, and to provide a forum for them to contribute toward the continuing education of all of the physicians in Maryland. The *MMJ* should also present timely articles on medical practice issues and matters of legislative importance to our membership.

A recent survey of our readers has identified areas of interest that the editorial board will strive to satisfy. The editorial board is committed to making the *MMJ* a worthwhile instrument for continuing medical education—a journal that will appeal to the varied interests and needs of our readers. Toward that end, we invite your critical analysis and suggestions.

Quality Service to Our Physicians and Patients!

Antimony and Cleopatra

Bart Gershen, M.D.

In the December 1991 *MMJ*, we discussed the origin of the term **amino acid**. You may recall that it evolved from **ammonia** which, in turn, derives rather circuitously from the ancient Egyptian sun god **Ammon**. The word **acid** entered our language through the Latin *acere* 'to be sour', the adjective of which is *acidus* 'sharp or sour'. *Acere* also resulted in another term: *acetum* 'vinegar', the acrid taste of which originates from **acetic acid**—a phrase you should immediately recognize as the height of redundancy. As Latin developed into French, *acere* became *aigre* which also means 'sour'. *Vin aigre* means 'sour wine'—vinegar.

The Latin *acere* (sour or sharp) stems from *acus* 'needle' as in **acupuncture**. One with clinical **acumen** is a 'sharp' physician, and one with **acute** hearing has very 'sharp' auscultatory skills. (An **acute** angle is quite pointed, and a patient with an **acute** abdomen has a stabbing bellyache.)

The opposite of an acid, which yields a proton, is an alkali, which provides a complementary electron. The origin of the term **alkali** is somewhat convoluted. Ancient people did not have soap. The closest they came to such cleansers was a combination of certain oils mixed with an abrasive material. The abrasive was prepared by burning certain grasses and woods, placing their ashes into a pot of water, pouring off the undissolved solids, and boiling the remaining mixture. After the water had completely evaporated, the residual ashes were removed from the pot, heated together with oils, and this unique compound was used for cleaning. The Arabs called the ashes *al quili* 'plant ash'—which, in English, became **alkali**.

The ashes were also called **pot ashes** or simply **potash**. In 1807, a British chemist, Sir Humphry Davy, passed an electric current through molten potash and recovered an unusual metal. He designated the element from its source, calling it **potassium**. Much later, other scientists decided to give it a more Latinized name. They named it **kalium** from **alkali**—hence providing us with the chemical signature "K." (Incidentally, **potash** is principally composed of potassium hydroxide.)

In 1808, Davy once again made an elemental discovery. He heated limestone and recovered a metal that he promptly named **calcium** from the Latin word for limestone *calx*. (Limestone is mainly CaCO_3 . Heating it drives off CO_2 , leaving residual calcium.)

A small stone or pebble was called a **calculus**. In ancient times, people did arithmetic by using a counting board known as an *abax*. By stringing pebbles into rows and sliding the stones back and forth as you counted, one could easily add and subtract large numbers. The *abax* is now known as an **abacus**, and mathematics is done by calculation. In 1684, two friendly scientific rivals simultaneously developed a new mathematical system. Sir Isaac Newton and Gottfried Wil-

helm Leibniz each separately published the method. It was called the **calculus**. Their friendship subsequently dissolved.

A yet more primitive method of counting involves the use of fingers (and toes). Since the Latin for this part of one's anatomy is known as a *digitus*, the numbers derived were called **digits**. Today we have something called a **digital calculator** which incorporates neither fingers and toes nor stones.

A kidney stone is logically called a **calculus**. And certain metabolic states—such as primary hyperoxaluria—cause a disorder known as **nephrocalcinosis**. However, true to the inconsistencies of language, a stone within the renal pelvis or ureter is known as nephro/uretero—**lithiasis** (Greek *lithos* 'stone'), and surgery to remove it is called a **lithotomy** (Greek *tome* 'a cutting', as in **anatomy**—"to cut up.")

Indeed, a **lithograph** is a picture (Greek *graphein* 'to write') created by designs that are cut into flat stones (or now, more fashionably, flat metal plates). And the archaeological period known as the Stone Age is referred to as the **Paleolithic**, **Mesolithic**, or **Neolithic** era (Greek *palaaios* 'ancient,' Greek *mesos* 'middle,' and Greek *neos* 'new'). **Megaliths** are giant (Greek *megas* 'huge') stones used in ancient monuments, such as those on Easter Island or at Stonehenge. A **monolith** (Greek *monos* 'single, alone') is a statue or obelisk carved from one stone. (A monolithic philosophy is metaphorically one which has a uniform, inflexible character.)

The element **lithium** was discovered in petalite stone by Swedish scientist Johan August Arfwedson in 1817. (Petalite is lithium aluminum silicate.)

The **os calcis** or **calcaneus** is, of course, the heel bone—named for its resemblance to a large stone. When heel spurs develop, perhaps we should refer to them as **calculi** of the **calcis**.

In ancient Egypt, women—such as the ravishing Cleopatra—applied a fine antimony powder to their eyelashes in order to entice suitors. (Antimony and Cleopatra?) This was called *al koh'l*—Arabic for powder of antimony. In the sixteenth century, chemists used this same term to describe the fine vapors of steam that rose from heated liquids. Wine is a mixture of water and other fluids that boil at much lower temperatures. When wine is heated, its vapors can be collected in cool glass tubes, yielding highly concentrated drops of that other chemical. The process is called **distillation** (Latin *de* 'down' + *stillare* 'to drop'.) The apparatus is sometimes referred to as a "still" for short. The stuff that comes out, we call **alcohol**.

Wine was known as *methy* in ancient Greece. Wood was called *hyle*. Therefore, wood alcohol (or wine) was known as *methy* + *hyle* or **methyl**. Today, we know its chemistry consists of CH_3 groups. We also appreciate that wood alcohol

WORD ROUNDS WORD ROUNDS W

is not safe to drink. The ancients, however, had another method of protection against the toxic effects of their libations. They believed that a lovely purple jewel worn about the neck—or, perhaps, fashioned into a drinking glass—would safeguard them from old John Barleycorn. They termed this precious stone **amethyein**—a ‘not’ + methyein ‘intoxicated’ (derived from *methy*).

We know it as **amethyst**. ■

MEMBERS IN THE NEWS MEMBERS IN T

James P.G. Flynn, M.D. has been named director of Corporate Rehabilitation Services for the University of Maryland Medical System. In his new position, Dr. Flynn will work to increase the referral base and develop new programs for the University of Maryland Rehabilitation Network.

Prior to his appointment, Dr. Flynn completed a two-year term as director of the Maryland Institute for Emergency Medical Services Systems. He was also the former chief executive officer and medical director of Montebello Rehabilitation Hospital.

In 1990, Dr. Flynn was named the National Rehabilitation Association Mid-Atlantic Administrator of the Year. In 1988, he was the recipient of the Louis L. Goldstein rehabilitation award. Dr. Flynn has participated in a number of national task forces and workshops pertaining to rehabilitation.

Dr. Flynn is a clinical professor in the Department of Neurology and an associate professor in the Department of Epidemiology and Preventive Medicine of the University of Maryland Medical Center. He is also an adjunct professor in the Department of Emergency Health Services of the University of Maryland Baltimore County. Dr. Flynn is a surveyor for the Commission on Accreditation of Rehabilitation Facilities (CARF). He is a fellow of the American College of Physicians and a fellow of the College of Chest Physicians.

Dr. Flynn received his medical degree with distinction in medicine from Trinity College, Dublin University. He trained at the Johns Hopkins Hospital, Baltimore City Hospitals, Greater Baltimore Medical Center, and the Maryland Department of Health and Mental Hygiene. He earned masters degrees from Trinity College and the Johns Hopkins University School of Hygiene and Public Health. ■

We Touch Maryland's Life Every Day

The development of biomedical science under Dean John M. Dennis, M.D.

Benjamin F. Trump, M.D.

Dr. Trump is professor and chairman, Department of Pathology, University of Maryland School of Medicine.

To honor John M. Dennis, M.D., dean emeritus of the University of Maryland School of Medicine, the faculty have assembled a series of papers to be included in the June and July issues of the *Maryland Medical Journal*. Dr. Dennis' term as dean (1973-1990) was a critical period for the School of Medicine and for new developments in biomedical science, especially in the application of cellular and molecular biology concepts and techniques to clinical medicine. During Dr. Dennis' tenure, the School of Medicine grew considerably, establishing itself in the forefront of US medical schools in the areas of research, teaching, and clinical science. Much of the credit for this rapid and prodigious development goes to Dr. Dennis who, through a remarkable series of recruiting efforts and expansion of building and other resources, was able to lead the School of Medicine to its present status.

In putting together this tribute to Dr. Dennis, the strategy was to obtain a paper from each department in the School of Medicine and a paper recounting the development of the University of Maryland Medical System. Perusal of these articles will highlight the development of biomedical science at the University of Maryland Medical School and the University of Maryland Medical System under the administration of John M. Dennis, M.D. ■

Inpatient Treatment For Dissociative Disorders

Under the direction of Dr. Richard J. Loewenstein, Sheppard Pratt's treatment program is based on the view that dissociative disorders are readily diagnosed and treated. Utilizing the Armstrong-Loewenstein Dissociative Disorders Assessment Protocol as a baseline, individual treatment planning is determined and the master treatment plan can include:

- intensive therapy specifically designed for people with histories of trauma and abuse;
- psychopharmacology;
- cognitive therapy;
- adjunctive hypnotherapy;
- stress management;
- managed milieu that teaches safe coping skills for symptoms such as: switching, dissociation, amnesia, and flashbacks;
- and a full range of expressive therapies.
- The staff of the DDU also provides education and therapy for the patient's present day family with assessments available for children.

Sheppard Pratt's DDU is available to adult patients with dissociative disorders or other chronic childhood onset, post-traumatic conditions who are:

- newly diagnosed and are unstable or;
- in acute crisis or are decompensating or;
- involved in working through difficult therapy material requiring a safe, secure setting or;
- dangerous to self or others and/or self mutilatory.

For more information or to make a referral, call: Dr. Susan Wait, coordinator for the inpatient DDU at (410) 938-5070.

Comments on John M. Dennis, M.D.

Donald E. Wilson, M.D.

Dr. Wilson is professor of medicine and dean, University of Maryland School of Medicine.

The transition between the administrations of Dean Emeritus John M. Dennis, M.D., Acting Dean Richard D. Richards, M.D., and my administration has been greatly facilitated by the presence of a world class faculty, an excellent student body, and an academic environment that promotes scholarship, innovation, and academic integrity. The basis for this environment has been the diligent stewardship of John Dennis during the sixteen years that he served as dean of the School of Medicine. At the time of Dr.

Dennis' retirement in 1990, the School of Medicine had moved into the top 20 percent of state-supported US medical schools in research funding. In FY1991, the School of Medicine's increase in National Institutes of Health (NIH) funding ranked first of all state-supported medical schools at 23 percent, and second of all US medical schools—public and private.

In the eight months that I have been dean, the School of Medicine has suffered severe budget cuts, furloughs of faculty and staff, and gloomy forecasts. Yet, our resiliency has allowed us to remain strong and, in fact, prosper. I thank Dr. Dennis for having the foresight and skill to build such a diversely strong faculty. His ongoing dedication to the School of Medicine and to Maryland continues to make my job easier. John Dennis is still working on behalf of the School of Medicine. In addition to being available for consultation, he is spending a portion of his time as a fund-raiser for the medical school. This activity is extremely im-

portant, given the recently announced fund-raising campaign of the University of Maryland Hospital and the School of Medicine.

Personally, I have found John Dennis to be warm and helpful. This is particularly important to a new dean. I look forward to his continued support and assistance in the years to come and wish him all the best in his richly deserved retirement. ■

Dr. Wilson (l) congratulates Dr. Dennis on his seventeen successful years as dean of the School of Medicine.

John M. Dennis, M.D., Dean of the University of Maryland School of Medicine: 1973-1990

Richard D. Richards, M.D. and Benjamin F. Trump, M.D.

From the University of Maryland School of Medicine where Dr. Richards is professor and chairperson, Department of Ophthalmology; and Dr. Trump is professor and chairperson, Department of Pathology

John M. Dennis, M.D. was dean of the University of Maryland School of Medicine for 17 years. His numerous accomplishments in that role will have a positive effect on the future of the School of Medicine for years to come.

Dr. John Dennis finished an extraordinary 17-year tenure as dean of the University of Maryland School of Medicine on June 30, 1990. During that time, remarkable changes occurred at the University of Maryland Medical School as a result of his vision and actions. The school had long been known for its emphasis on clinical education of medical students. Dr. Dennis fostered and developed a climate for research, both basic and clinical, and the school became known for its research efforts in addition to its clinical activities. As the only two department chairpersons present both before and during Dr. Dennis' entire tenure, we were privileged to participate in these changes and are pleased to recount our view of the impact of Dean Dennis on the University of Maryland School of Medicine.

Dr. Dennis was perhaps an unlikely prospect to serve as dean but, fortunately, circumstances developed that pointed him in that direction. The faculty and the alumni remain appreciative for those circumstances. Dr. Dennis was born on the Eastern Shore, and spent his entire professional career at the University of Maryland. He received his B.S. in 1943 from the University of Maryland College Park, and his M.D. from the University of Maryland School of Medicine in 1945. His internship was at the University of Maryland Hospital, as was his residency in radiology which he completed in 1950. Between graduation and completion of his residency, he spent two years in the armed services, during which time he was chief of radiology at a US Air Force base hospital. After his residency, Dr. Dennis spent one year as a fellow at the Hospital of the University of Pennsylvania. He then returned to the University of Maryland School of Medicine, first as an instructor and then as an associate professor in the Department of Radiology from 1951-1953.

In 1953, the position of chairperson became vacant, and the dean of the medical school, Dr. H. Boyd Wylie, recognized the potential of John Dennis and named him professor and chairperson of the Department of Radiology. Dr. Dennis was the first full-time chairperson in the medical school, although Theodore Woodward, M.D. was the first full-time faculty member (appointed in 1948) in the Department of Medicine. Dr.

Dennis was chairperson of the department from 1953 to 1974. During that time, he developed strong ties with his fellow radiologists and became involved in leadership positions with national radiological organizations. He was particularly active in the American Board of Radiology and the American College of Radiology, serving as president of the latter from 1976 to 1977. He continued his activities with these groups throughout his terms as chairperson and as dean. Dr. Dennis was recognized as a national leader in the field of radiology and received a number of honors from these organizations.

As chairperson of the Department of Radiology, he served for 2 years under Dean H. Boyd Wylie, M.D. and then under Dean William S. Stone, M.D. from 1955 to 1969. Dr. Stone was brought to the University of Maryland by President Harry Byrd during a time of academic difficulties for the School of Medicine. Dr. Stone was responsible for continuing the move to full-time departmental chairpersons and faculty, with limited state support. During this time, Dr. Wilson Elkins became president of the university and he continued to provide support for the medical school by appointing Albin Kuhn, M.D. as chancellor for the University of Maryland at Baltimore (UMAB) campus. Dr. Dennis and Dr. Kuhn worked closely on Dr. Dennis' plans for the development of the Department of Radiology.

In 1969, John H. Moxley III, M.D. was appointed dean—a position he held until 1973. This was a period of campus development during which several new department chairpersons were appointed. During this early growth phase, Dr. Moxley was successful in developing plans for the Medical School Teaching Facility.

In 1973, with the departure of Dr. Moxley, Dr. Dennis was named acting dean. Following a search for a permanent dean and a review of the proposed candidates, Chancellor Kuhn appointed John M. Dennis, M.D. as dean in 1974. Having been chairperson of the Department of Radiology for 20 years, Dr. Dennis had a clear understanding of the difficulties the School of Medicine had gone through. He recognized that the key to progress and stability for the school was the appointment of chairpersons and faculty who shared his vision of the role of research in a medical school. Although this was a time during which funds were available through the National Institutes of Health (NIH), Dr. Dennis was also successful in working with Chancellor Kuhn to increase support from the state of Maryland. Chancellor Kuhn and Dean Dennis developed

Dr. Dennis with his family: From left to right, Anthony Ranieri, M.D. and his wife, Lori Ranieri (daughter); John Dennis, M.D. and his wife, Mary Ellen Dennis; Terry Passano (daughter) and her husband, William Passano; John M. Dennis, Jr., S.J. (son); and Sherry Dennis and her husband, Patrick Dennis (son).

effective relationships with the governor and state legislators, who responded by recognizing the strength of Dean Dennis' leadership and the importance of supporting the School of Medicine.

During his 17 years as dean, Dr. Dennis recruited department chairpersons for all of the departments within the medical school with the exception of two; some chairs he even filled a second time. Starting with the basic science departments, he recruited chairpersons who had enthusiasm and excellent research backgrounds, supporting them in the development of their departments and in the recruitment of young faculty. By 1990, the number of full-time faculty had grown to almost 900, with approximately 350 supported by state funds. The rest of the faculty were supported by the increasing funds provided by grants, contracts, and other outside sources.

Dr. Dennis also recruited, for clinical departments, chairpersons who had an interest in research and who had backgrounds enabling them to develop effective and extensive research programs through the recruitment of appropriate faculty members. In the last year of his tenure as dean, the American Association of Medical Colleges ranked the University of Maryland Medical School number 13 in the amount of NIH peer-reviewed, grant support provided to the 74 public medical schools, and number 33 in the amount of support provided to all 126 medical schools. During that year, the University of Maryland Medical School chalked up the greatest percentage increase in NIH funding of any public medical school and was second only to the University of Southern California

among all medical schools. This achievement, accomplished in a climate of fiscal restraint and competition, is only one measure of Dr. Dennis' success in developing the school's research activities.

Dr. Dennis also pushed hard for the replacement of the Loch Raven Veterans Administration (VA) Hospital with a new facility on the campus of the University of Maryland at Baltimore. In 1970, planning began, and in 1979, the VA purchased land adjacent to the University of Maryland Hospital for its new location. The contract was awarded in 1980, but was incomplete at the time President Reagan took office.

John Dennis did not give up hope on the fulfillment of the building contract, but worked diligently through the years to ensure completion of the VA hospital on the UMAB campus. He worked with the Maryland congressional delegation and veterans groups, and he has given a great deal of credit to then US Senator Mathias for gaining the Maryland delegation's support of the proposed VA hospital. Dr. Dennis persevered and was rewarded by being able to participate in the groundbreaking ceremony for the new VA hospital. At this time, the new VA hospital is almost completed and all patients will be moved from the Loch Raven Veterans Administration Medical Center (VAMC) to the new VAMC in November of 1992.

While dean, Dr. Dennis held other titles including vice chancellor of Health Affairs, vice president for Academic Affairs, and acting chancellor of the University of Maryland at Baltimore from April to December of 1984. He worked closely with Chancellor Kuhn, with Chancellor Farmer who succeeded Chancellor Kuhn, and with Chancellor Brandt. Dean Dennis started the graduate school while serving as vice president for Academic Affairs and was also responsible for the university's Grants and Contracts Office.

Dr. Dennis recognized the need for upgrading the existing research facilities and was able to institute a program of renovation for the John Eager Howard Hall. However, as the research activities on campus increased, lack of adequate space became a serious problem. With Dr. Marjorie Wilson, then senior associate dean, Dr. Dennis developed plans for a research building that would significantly expand the amount of research space available for faculty from all the health science professional schools on the UMAB campus. Although various methods of financing were explored, he was successful in

convincing state legislators that the state should erect this building.

He was able to accomplish this by showing the governor and state legislature how important the medical school was to the economic condition of the state, and the extent to which outside funds were brought in by the faculty of the School of Medicine. Although the University of Maryland School of Medicine is regarded as a state school, only 20–25 percent of the budget, at that time, came from state funds, with the remainder coming from outside sources.

While emphasizing the importance of becoming a medical school noted for research, Dr. Dennis did not neglect clinical activities. He strongly supported the clinical departments in the development of appropriate space for faculty practice. He also recognized the importance of the partnership between the medical school and the hospital, and developed, with Dr. Morton Rapoport, CEO of the University of Maryland Medical Systems, the concept of the medical center. The medical center system, now well accepted by both the hospital and medical school administration and faculty, has resulted in the development of a true partnership arrangement.

Dr. Dennis also recognized the need to continually review the medical school curriculum. He believed the faculty should be in charge of the curriculum, and always supported the faculty in this regard. At the same time, however, he encouraged recommendations for changes in the curriculum.

We now think in terms of strategic plans and planning committees. Dr. Dennis did not have a strategic planning committee nor a written strategic plan. However, he obviously had a strategic plan in his mind, and his vision was clearly articulated in his actions. His philosophy as a dean was to support his faculty in every way, but not to interfere with their progress as long as the progress was in the general direction that he considered appropriate. Since he appointed the chairpersons, he was careful to select those who had a vision similar to his own, and the end result was a very harmonious and progressive period of time. Few deans have had such an impact on medical schools as has John Dennis. By the same token, few medical schools have responded and progressed to the extent that the University of Maryland Medical School did during that time. ■

COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital/Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.

The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families.

The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (301)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (301)727-1020.

HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. If you wish to help further the work of the Committee through a tax deductible donation send your check to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1204 Maryland Avenue, Baltimore, Maryland 21201 Please note on your donation: "Physician Rehab"

Endogenous ouabain: Implications for cardiovascular disease diagnosis and therapy

Mordecai P. Blaustein, M.D. and John M. Hamlyn, Ph.D.

From the Department of Physiology, University of Maryland School of Medicine, where Dr. Blaustein is professor and chairman and Dr. Hamlyn is associate professor.

The remarkable discovery that ouabain (endogenous digitalis) is a hormone produced by the adrenal cortex raises important questions about the physiological actions of this substance and its role in the pathogenesis and therapy of cardiovascular diseases.

Two different lines of research recently converged to provide new ideas about sodium regulation and blood pressure—blood volume relationships in humans. One is the search for an endogenous counterpart to the cardiotonic steroids (digitalis glycosides) of plant origin which have been used to treat congestive heart failure for over two centuries and for which there are receptors (the sodium pump or Na,K-ATPase) on virtually all cells in the human body.¹ The second is the search for a mechanism to explain how excess dietary salt may lead to the elevation of blood pressure.^{2,3} Both searches have led to the purification and identification of a substance from human plasma that, astonishingly, is structurally and functionally indistinguishable from the plant-derived cardiotonic steroid and arrow poison, ouabain.⁴ This mammalian substance, which cross-reacts with anti-ouabain antibodies and inhibits the sodium pump (the digitalis receptor), is present in high concentration in adrenal glands and is secreted by cultured adrenal cortical cells.⁴ The sodium pump, which utilizes metabolic energy (in the form of ATP) to extrude sodium from cells so as to maintain a very low intracellular sodium concentration, is the only known receptor for ouabain. Therefore, we need to focus on the physiological consequences of sodium pump modulation in order to understand how ouabain works.

Possible role of ouabain in the pathogenesis of hypertension

A key question is whether ouabain is involved in the pathogenesis of human hypertension. Preliminary evidence indicates an affirmative answer.

In the first controlled study on the relationship between ouabain and hypertension, plasma ouabain levels were found to be much higher than normal in patients with acute hypothyroid-induced hypertension; indeed, blood pressure was directly correlated with the plasma ouabain level.⁵ Furthermore, blood pressure and ouabain levels both returned to normal when the patients were made euthyroid with thyroid hormone replacement therapy.⁵

A recent report⁶ indicated that 60 percent of Japanese with essential

Plasma volume expansion and blood pressure elevation

This raises a new question: How, precisely, does plasma volume expansion cause the blood pressure to rise? That is, what are the specific mechanisms involved? Mineralocorticoid hypertension appears to be a good model to address this question because high concentrations of mineralocorticoids initially cause salt retention and plasma volume expansion without blood pressure elevation. This early phase is, however, associated with very high plasma levels of a sodium pump inhibitor (EDLF; **Figure 3**),¹⁸ which implies that plasma volume expansion, by as yet unknown mechanisms, may trigger the secretion of ouabain. With maintained high doses of mineralocorticoids, there is a transient "escape" natriuresis. This is followed by a parallel rise of the plasma level of a sodium pump inhibitor and of blood pressure.¹⁸ The fact that the sodium pump inhibitor level rises before the blood pressure does, raises the possibility that the sodium transport inhibitor somehow causes the blood pressure to rise. Moreover, this observation may have very important clinical implications; detection of elevated ouabain levels in normotensive individuals with normal cardiac function may be a prognostic indicator for the later development of hypertension. In this regard, a convenient laboratory test to measure plasma ouabain levels is currently under commercial development.

How does ouabain elevate blood pressure?

Knowledge of the mechanism by which (plant-derived) ouabain can enhance vascular reactivity provided early justification to search for an endogenous ouabain as a missing factor in the pathogenesis of hypertension.^{2,3} In the heart, the plasma membrane sodium/calcium exchanger is the link that helps to explain how inhibition of the cardiac sodium pump increases delivery of calcium to cardiac muscle;¹ this increased intracellular calcium (most of it normally stored in the sarcoplasmic reticulum) is what actually augments contractions. Vascular smooth muscle cells also have a plasma membrane sodium pump and a sodium/calcium exchanger. In blood vessels, as in the heart, cardiotonic steroids, including human ouabain, increase the delivery of calcium to the smooth muscle cells and thereby augment the contractile responses to vasoconstrictors.^{2,19} Cardiotonic steroids also inhibit the sodium pump in vasoconstrictor nerve terminals in the vascular wall; this augments noradrenaline release and reduces re-uptake, thereby acting synergistically with the direct effects of cardiotonic steroids on the vascular smooth muscle.²⁰ Thus, the net effect of elevated plasma ouabain levels will be an increase in vascular tone (**Figure 2**). Initially, this will be offset by the cardiovascular reflexes (primarily the baroreceptor reflex) that tend to maintain the mean blood pressure within preset limits. Once the capacity of these reflexes is exceeded, however, mean arterial pressure will rise. This will induce a natriuresis that may compensate for the underlying tendency to retain salt and water. Thus, it appears that the body is normally adjusted to maintain a normal plasma vol-

Figure 3. Time course of changes in mean arterial pressure (MAP) and the endogenous sodium pump inhibitor (EDLF) during the development of deoxycorticosterone acetate (DOCA) hypertension in the pig. The uninephrectomized pigs received silicone implants containing 100 mg DOCA/kg body weight on day 0 (broken vertical line). EDLF was determined by a human erythrocyte ouabain-sensitive ⁸⁶Rb uptake assay. Each point is the mean \pm SE of data from six animals. (Reprinted from Hamlyn JM. *Journal of Endocrinology* 1989; 122:409-20.)

ume even at the expense of an elevated blood pressure. In the majority of individuals with chronic hypertension, including those with essential hypertension, Conn's syndrome, and pregnancy-induced hypertension (and perhaps other forms of hypertension as well), plasma volume is normal or low-normal and obscures the evidence that the initiating event may have been a tendency to volume expansion.²¹ The mechanism(s) by which the volume expansion is detected and converted into the signals(s) that stimulate secretion of ouabain is (are) yet to be elucidated.

Other implications of endogenous ouabain

As described above, the discovery of endogenous ouabain may contribute to our understanding of the pathogenesis of hypertension; however, the implications of this discovery are much more far-reaching. Ouabain may play a role in modulating sodium pump activity in a variety of types of cells. The small changes in intracellular sodium may then be transduced, via sodium/calcium exchange, into relatively large changes in cell calcium, most of which is sequestered in intracellular organelles (especially the endoplasmic reticulum). The endoplasmic reticulum serves as a store for the "second messenger" calcium that mediates such processes (known to be affected by ouabain) as muscle contraction, secretion of

hormones and neurotransmitters, renal sodium reabsorption, visual adaptation, and cell division. In this way, ouabain may modulate cell responsiveness in many types of tissues under a large variety of conditions; indeed, this may be one of its major physiological actions.²² Finally, the role of digitalis therapy in congestive heart failure and other diseases will also require re-evaluation; for example, preliminary evidence indicates that ouabain levels are significantly elevated in patients with severe cardiac failure.²³ The discovery of endogenous ouabain opens up numerous physiological and pathophysiological processes to renewed exploration.

Supported by the Office of the Dean, University of Maryland School of Medicine, and the Office of the Vice-President for Graduate Studies and Research, the University of Maryland, Baltimore, by NIH grants NS-16016 and HL-45215 to Mordecai P. Blaustein, M.D., and by an American Heart Association Grant-in-Aid to John M. Hamlyn, Ph.D. Dr. Hamlyn is an Established Investigator of the American Heart Association. We wish to acknowledge our colleagues and collaborators at the Upjohn Company, Kalamazoo, MI (Drs. Donald W. DuCharme, Douglas W. Harris, James H. Ludens, Frederic Mandel, and W. Rodney Mathews) who made critical contributions to the discovery of endogenous ouabain. ■

This article is dedicated to Dean Emeritus John M. Dennis, M.D., through whose foresight this research flourished. His encouragement, and financial assistance from his office, enabled us to carry out the research that led to this discovery of human endogenous digitalis.

The role of ionized cytosolic calcium ($[Ca^{2+}]_i$) in injury and recovery from anoxia and ischemia

Benjamin F. Trump, M.D.; Irene K. Berezsky, B.A.;
Mary W. Smith, M.S.; and Patricia C. Phelps, A.B.

From the Department of Pathology, University of Maryland School of Medicine, where Dr. Trump is professor and chairperson; and Ms. Berezsky, Ms. Smith and Ms. Phelps are clinical instructors.

Cellular reaction to deprivation of oxygen and/or lack of substrate perfusion due to altered blood flow can be categorized in three phases: initiation, reversible, and irreversible or recovery.

The response to and recovery from injury are the major determinants of cell survival. An understanding of these processes will permit the design and implementation of a variety of medical technologies for the prevention, diagnosis, and treatment of all human disease.

Of all injuries to human cells, the most prevalent is deprivation of oxygen and/or lack of substrate perfusion due to altered blood flow. These injuries are responsible for the initiation of virtually all illnesses and death resulting from stroke, myocardial infarction, shock, trauma, diabetes, and hypertension. Cellular anoxia is also a major impediment to the radiation treatment of neoplasia and, if controlled, would assist in cancer chemotherapy.

For these reasons, our laboratory has been concerned for many years with understanding cellular reactions to these injuries, their impact on recovery, and the molecular mechanisms involved.¹⁻¹⁰ Our investigations have led us to the hypothesis that the critical events involve intracellular signaling—especially that involved with ion regulation (**Figure 1**). It appears that regulation of the intracellular ion Ca^{2+} is the most critical.^{2,6-10} This paper presents a summary of these experiments.

The responses to injury have been categorized as follows: initiation phase, reversible phase, and irreversible or recovery phase. These have been described previously and are summarized briefly below.^{1,2}

Initiation phase

The initiation phase of ischemia begins with the interruption of the blood supply to the cell, organ, or tissue at risk. The ischemia can be partial or complete, depending on the extent of vascular occlusion and the degree of collateral vessel development. For the purpose of the present discussion, we will confine our remarks to the effects of total ischemia.

With ischemia, oxygen levels in blood and interstitial tissues decrease to levels approaching zero as consumption by the surrounding cells proceeds. This soon leads to total anoxia and inhibition of mitochondrial respiration. Mitochondrial ATP (adenosine triphosphate) synthesis

ceases and the cell is totally dependent on anaerobic glycolysis for ATP synthesis. Depending on the cell and tissue type, temperature, and the amount of cellular glycogen present, ATP synthesis lasts for a variable period ranging from seconds to perhaps an hour in highly glycolytic cells replete with glycogen. Lactate and inorganic phosphate accumulate, reducing intra- and extracellular pH. These actions precede the events of the reversible and then the irreversible phases.

Reversible phase

Intracellular alterations begin immediately following the initiation phase. Reduction in cellular ATP and morphologic damages occur simultaneously in seconds. These changes combine to induce a sequence of structural and functional alterations, all of which are reversible if the blood supply is restored prior to the point-of-no-return. In the rat liver, human liver, or human kidney, this reversible phase has a duration of about 60 minutes at 37° C; in the heart, the reversible phase lasts only 15–20 minutes at the same temperature.

Morphologically, the changes in this phase are characterized by alterations in cell shape, changes in intracellular compartment volume, and complex nuclear and nucleolar alterations including clumping of chromatin. The changes in

cell shape are characterized by formation, at the cell surface, of large bleb-like protrusions that have a low refractive index and are relatively free of organelles.⁶ This blebbing represents a change in the interactions of cytoskeletal elements, including actin and tubulin, with the plasmalemma. The actin filaments detach from the surface plasmalemma forming a constrictive band at the base of the bleb. It is postulated that this constrictive band later contracts and seals off the membrane with the bleb detaching and floating into the extracellular space. Our studies indicate that bleb formation occurs when the concentration of cytosolic ionized calcium ($[Ca^{2+}]_i$) is greater than 300 nM.^{6,7} Bleb formation appears to involve Ca^{2+} -activated proteases which, among other factors, may modulate the cytoskeleton in this region.⁵ *In vivo*, these blebs may be important in obstructing the kidney tubule lumens in acute renal failure, in releasing hepatic enzymes such as SGPT (serum glutamic pyruvic transaminase) into the extracellular space, and in myocardial cell-cell interactions.

Other morphological changes in this phase include dilatation of the endoplasmic reticulum, changes in the mitochondria, and changes in the nucleus. The cisternae of the endoplasmic reticulum undergo dilatation that is often wide-

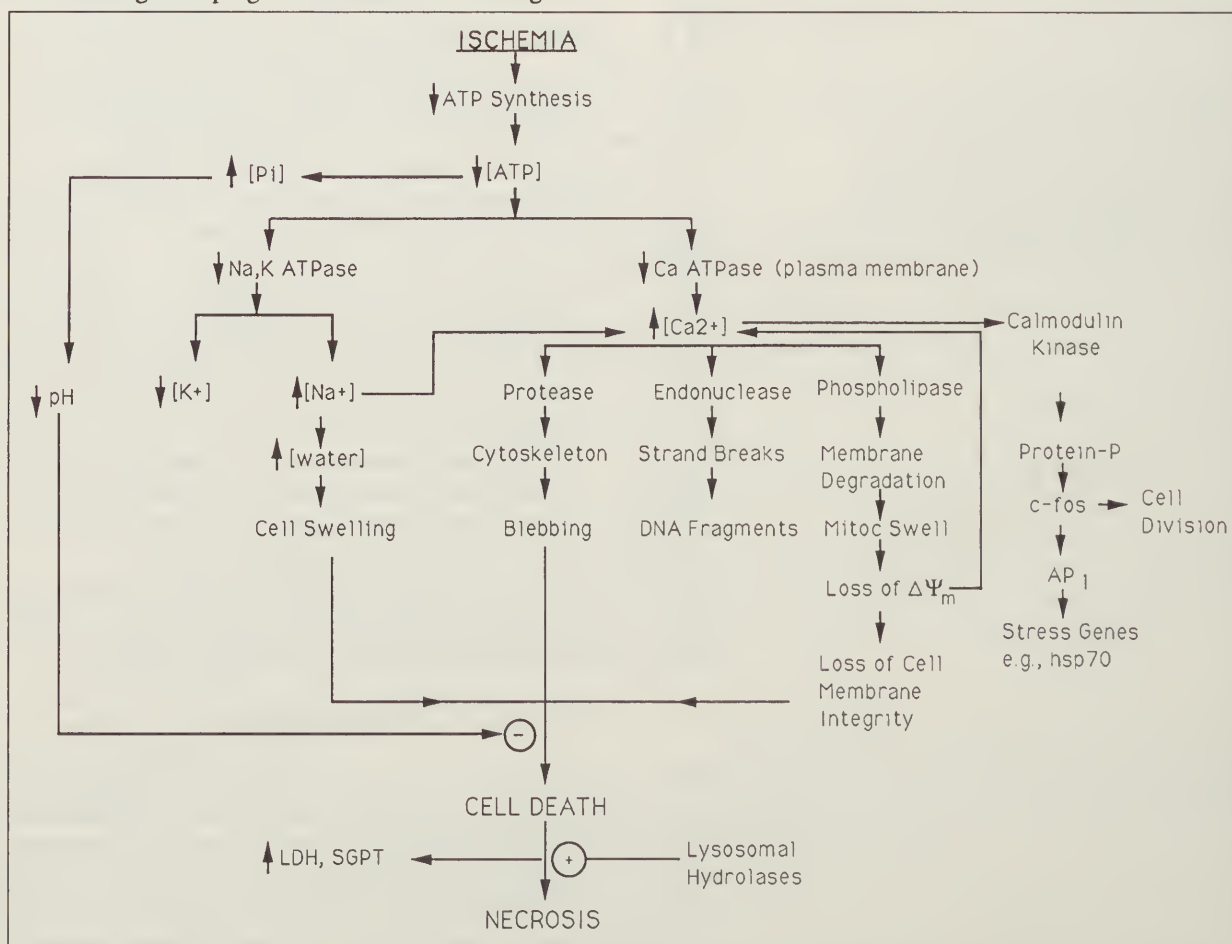

Figure 1. Flow chart representing our current working hypothesis concerning the relationships between ion deregulation and the progression of cell injury resulting from ischemia. Decreased ATP production leads to cessation of Ca^{2+} - and Na^{+}/K^{+} -ATPases accompanied by increases in cytosolic H^{+} , Na^{+} , and Ca^{2+} . The increased Ca^{2+} is detrimental, particularly through activation of proteases, endonucleases, and phospholipases.

spread and may result in small vacuoles in the cytoplasm and the cavity of the nuclear envelope. Initially, the mitochondria undergo condensation of the inner compartment and often loss of the normal mitochondrial matrix granules. Later, swelling of the mitochondrial inner compartments occurs. Changes of the nucleus involve very early clumping of chromatin which can occur within 5 minutes.

In the absence of ATP, ion translocating systems, such as Na^+/K^+ - or Ca^{2+} -activated ATPases, cease to function. This process is associated with increases of cytosolic Na^+ ($[\text{Na}^+]_i$), decreases of cytosolic K^+ ($[\text{K}^+]_i$), and increases of $[\text{Ca}^{2+}]_i$. $[\text{Ca}^{2+}]_i$ increases from 100 μM to 400–500 nM by approximately 1 hour as measured *in vitro* using rabbit proximal tubule epithelial cells treated with KCN plus iodoacetate to mimic ischemia by inhibiting both mitochondrial and glycolytic metabolism.⁸ Greater and more rapid increases in $[\text{Ca}^{2+}]_i$ are seen in the hepatocyte following treatment with KCN and iodoacetic acid (Figure 2).

This increased $[\text{Ca}^{2+}]_i$ appears to represent the mechanism for activation of a number of pathways that mediate both membrane damage and, ultimately, cell death while activating signaling pathways that play a role in gene activation preparatory to increased cell division and regeneration. These signaling pathways include Ca^{2+} -activated enzymes such as phospholipase A_2 , endonucleases, and proteases. Activation of phospholipase is associated with alterations of membrane phospholipids and release of fatty acids which, in turn, result in morphological changes such as mitochondrial swelling. Activation of Ca^{2+} -dependent endonucleases yields DNA single-strand breaks within the chromatin. These breaks occur in association with chromatin clumping. Ca^{2+} -activated

proteases or calpains can modify a number of substrates, including the cytoskeletal protein, actin, and its associated membrane-binding proteins. Calpain activation may represent the mechanism of action of bleb formation.⁵

Irreversible phase

Cell death occurs if the ischemic injury is prolonged further. Morphologically, this stage is characterized by further swelling of intracellular organelles, especially the mitochondria. Irreversible injury is heralded by the appearance of large aggregates of denatured protein within the mitochondrial matrix, often referred to as flocculent densities. At this point, the mitochondria are irreversibly damaged and cannot perform oxidative phosphorylation, presumably due to damage of the membrane. This results in the inability to maintain a proton gradient and, probably, uncoupling of ATP production. Biochemically, there is continued degradation of substrates in-

cluding lipids, proteins, and nucleic acids, and also the loss of cell membrane integrity. This degradation is evidenced by increased leakage of ions into or out of the cell and in the release of cytosolic enzymes, such as lactate dehydrogenase, into the medium. Enzyme leakage is the basis of diagnosis of necrotic areas in animals or patients as determined by the measurement of serum levels of enzymes such as creatine kinase, SGOT (serum glutamic oxaloacetic transaminase), and SGPT.

Necrosis results from the continued hydrolytic attack on all substrates. Lysosomal hydrolases, at this time, have access to all cytoplasmic substrates and gradually convert them to necrotic debris. A hallmark of this phase is increased eosinophilia of the cytoplasm due to protein denaturation and total degradation of chromosomal DNA (deoxyribonu-

Figure 2. Changes in $[\text{Ca}^{2+}]_i$ as observed in a colony of four rat hepatocytes. Rat hepatocytes, isolated as described by Lemasters et al,¹¹ were cultured for two days. They were then loaded with Fura 2, a Ca^{2+} -sensitive fluorescent probe, treated with 1 mM KCN + 1 mM iodoacetate and examined by digital imaging fluorescence microscopy as described previously.⁸ Increases in $[\text{Ca}^{2+}]_i$ correlate with increasing intensity of the grey scale images that were generated by ratioing the fluorescent images acquired with 340 and 380 nm excitation wavelengths. Before treatment, $[\text{Ca}^{2+}]_i$ is about 100 nM, and nuclei are darker than the cytosol (Figure 2A); by 3 minutes, it is 2- to 3-fold higher in most cells (Figure 2B). Each cell then undergoes, in sequence, a large increase in $[\text{Ca}^{2+}]_i$, formation of cytoplasmic blebs, and, finally, cell death. At 7.1 minutes (Figure 2C), small blebs are apparent on the upper left cell. Figure 2D shows elevated $[\text{Ca}^{2+}]_i$ in three of the four cells. Figure 2E is one of the fluorescent image pairs (340 nm ex) used to generate the ratioed image in Figure 2D. Figure 2F is a phase microscopy image collected at 12 minutes showing two blebs on two cells. The blebs seen earlier in the upper left cell have disappeared. In Figure 2G, at 14 minutes, the two blebs are apparent in the ratioed image; at 18 minutes (Figure 2H), one bleb has disappeared and the two upper cells appear to be dead. By 20 minutes (Figure 2I), only the one cell (lower right) remains viable.

cleic acid) and protein, resulting in karyolysis.

Recovery phase

If blood flow is restored and the cells are reoxygenated during the reversible phase of ischemic injury, the recovery phase follows with a regenerative response in epithelial cells, such as in the liver or kidney, and recovery in nondividing cells, such as in the myocardium. Following restoration of blood flow, the cells begin to receive both oxygen and substrate. This usually leads to recovery; however, in some situations, it can also lead to further damage. In some systems, this additional injury has been attributed to the formation of active oxygen species through the xanthine-xanthine oxidase system.²

The recovery phase is associated with the rapid activation of a number of early immediate genes including *c-fos*, *c-jun*, and *c-myc*.⁴ The induction appears to involve Ca^{2+} -responsive elements, resulting in modulation of protein kinases, especially calmodulin kinase¹⁰ (Figure 3). Other protein kinases, such as protein kinase C, may also be activated, but

do not appear to be directly responsible for this early gene activation. This step is followed by activation of the gene regulator AP1, which can then initiate later stress or heat shock genes, including collagenase and metallothionein.

Conclusion

It is evident that clarification of the complex cellular events following anoxic or ischemic injury is developing through analysis at the cellular and molecular levels. The altered regulation of intracellular ions, especially $[Ca^{2+}]_i$, appears to be intimately involved in the initiation of injury, cell death, and recovery phases (in sublethally injured cells). Future studies should target the prevention and/or management of deregulation of $[Ca^{2+}]_i$ in this spectrum of disorders.

Figure 3. Modification of *c-fos* expression by X/XOD. Primary cultures of rat PTE treated with 100 μ M xanthine + 25 mU/ml xanthine oxidase for 30 minutes show a large increase in *c-fos* in comparison with untreated control cells (C). The mechanism of induction was studied by using the following: Quin 2/AM (Q2) (30 μ M) to buffer $[Ca^{2+}]_i$; protein kinase inhibitors, H7, 2-aminopurine (2-AP) and staurosporine (ST); and 3-aminobenzamide (3-AB), an inhibitor of poly ADP-ribosylation. Actin was used to normalize sample size. X/XOD-induced *c-fos* expression was inhibited by lowering $[Ca^{2+}]_i$ with Quin 2 and by inhibiting poly ADP ribosylation. The ACCUPRIL Single-Agent CommitmentTM

Parke-Davis is confident that for many of your hypertensive patients ACCUPRIL will achieve the decrease in blood pressure you expect.

If, in your medical judgment, your patient requires a diuretic in addition to ACCUPRIL at any time during ACCUPRIL therapy, Parke-Davis will refund your patient's cost of the diuretic.*†

ONCE-A-DAY ‡
ACCUPRIL[®]
quinapril HCl tablets 10, 20, 40 mg

* See DOSAGE AND ADMINISTRATION section of prescribing information.

† If, after an adequate trial of ACCUPRIL alone, based on your medical judgment as the prescribing physician, you determine that your patient requires the addition of a diuretic, Parke-Davis will refund to the patient his/her cost for the diuretic prescription less any amount reimbursed or paid for by an HMO, insurance company, or any other plan or program. For more details, ask your Parke-Davis Representative or call 1-800-955-3077.

‡ In some patients, the antihypertensive effect may diminish toward the end of the once-daily dosing interval. In such patients, an increase in dosage or twice-daily administration may be warranted.

ACCUPRIL is available in 10, 20, and 40 mg tablets. Usual initial starting dosage is 10 mg once daily.

ACCUPRIL is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Please see brief summary of prescribing information on following page.

Accupril® (Quinapril Hydrochloride Tablets)

USE IN PREGNANCY

When used in pregnancy during the second and third trimesters, ACE inhibitors can cause injury and even death to the developing fetus. When pregnancy is detected, ACCUPRIL should be discontinued as soon as possible. See WARNINGS, Fetal/Neonatal Morbidity and Mortality.

Before prescribing, please see full prescribing information. A brief summary follows.

INDICATIONS AND USAGE

ACCUPRIL is indicated for the treatment of hypertension. It may be used alone or in combination with thiazide diuretics.

In using ACCUPRIL, consideration should be given to the fact that another angiotensin-converting enzyme (ACE) inhibitor, captopril, has caused agranulocytosis, particularly in patients with renal impairment or collagen vascular disease. Available data are insufficient to show that ACCUPRIL does not have a similar risk (see WARNINGS).

CONTRAINDICATIONS

ACCUPRIL is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

WARNINGS

Angioedema: Angioedema of the face, extremities, lips, tongue, glottis, and larynx has been reported in patients treated with ACE inhibitors and has been seen in 0.1% of patients receiving ACCUPRIL. Angioedema associated with laryngeal edema can be fatal. If laryngeal stridor or angioedema of the face, tongue, or glottis occurs, treatment with ACCUPRIL should be discontinued immediately, the patient treated in accordance with accepted medical care, and carefully observed until the swelling disappears. In instances where swelling is confined to the face and lips, the condition generally resolves without treatment; antihistamines may be useful in relieving symptoms. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, emergency therapy including, but not limited to, subcutaneous epinephrine solution 1:1000 (0.3 to 0.5 mL) should be promptly administered (see ADVERSE REACTIONS).**

Hypotension: Symptomatic hypotension was rarely seen in uncomplicated hypertensive patients treated with ACCUPRIL but, as with other ACE inhibitors, it is a possible consequence of therapy in salt/volume depleted patients, such as those previously treated with diuretics or dietary salt restriction or who are on dialysis (see PRECAUTIONS, DRUG INTERACTIONS, and ADVERSE REACTIONS). In controlled studies, syncope was observed in 0.4% of patients (N = 3203); this incidence was similar to that observed for captopril (1%) and enalapril (0.8%).

In patients with concomitant congestive heart failure, with or without associated renal insufficiency, ACE inhibitor therapy may cause excessive hypotension, which may be associated with oliguria or azotemia and, rarely, with acute renal failure and death. In such patients, ACCUPRIL therapy should be started at the recommended dose under close medical supervision. These patients should be followed closely for the first 2 weeks of treatment and whenever the dosage of antihypertensive medication is increased (see DOSAGE AND ADMINISTRATION).

If symptomatic hypotension occurs, the patient should be placed in the supine position and, if necessary, normal saline may be administered intravenously. A transient hypotensive response is not a contraindication to further doses; however, lower doses of ACCUPRIL or reduced concomitant diuretic therapy should be considered.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression rarely in patients with uncomplicated hypertension, but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease such as systemic lupus erythematosus or scleroderma. Agranulocytosis did occur during ACCUPRIL treatment in one patient with a history of neutropenia during previous captopril therapy. Available data from clinical trials of ACCUPRIL are insufficient to show that, in patients without prior reactions to other ACE inhibitors, ACCUPRIL does not cause agranulocytosis at similar rates. As with other ACE inhibitors, periodic monitoring of white blood cell counts in patients with collagen vascular disease and/or renal disease should be considered.

Fetal/Neonatal Morbidity and Mortality: ACE inhibitors can cause fetal and neonatal morbidity and death when administered to pregnant women. Several dozen cases have been reported in the world literature. When pregnancy is detected, ACE inhibitors should be discontinued as soon as possible.

The use of ACE inhibitors during the second and third trimesters of pregnancy has been associated with fetal and neonatal injury, including hypotension, neonatal skull hypoplasia, anuria, reversible or irreversible renal failure, and death. Oligohydramnios has also been reported, presumably resulting from decreased fetal renal function; oligohydramnios in this setting has been associated with fetal limb contractures, craniofacial deformation, and hypoplastic lung development. Prematurity, intrauterine growth retardation, and patent ductus arteriosus have also been reported, although it is not clear whether these occurrences were due to the ACE inhibitor exposure.

These adverse effects do not appear to have resulted from intrauterine ACE inhibitor exposure that has been limited to the first trimester. Mothers whose embryos and fetuses are exposed to ACE inhibitors only during the first trimester should be so informed. Nonetheless, when patients become pregnant, physicians should make every effort to discontinue the use of ACCUPRIL as soon as possible.

Rarely (probably less often than once in every thousand pregnancies), no alternative to ACE inhibitors will be found. In these rare cases, the mothers should be apprised of the potential hazards to their fetuses, and serial ultrasound examinations should be performed to assess the intrauterine environment.

If oligohydramnios is observed, ACCUPRIL should be discontinued unless it is considered life-saving for the mother. Contraction stress testing (CST), a non-stress test (NST), or biophysical profiling (BPP) may be appropriate, depending upon the week of pregnancy. Patients and physicians should be aware, however, that oligohydramnios may not appear until after the fetus has sustained irreversible injury.

Infants with histories of *in utero* exposure to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion. Exchange transfusion or dialysis may be required as a means of reversing hypotension and/or substituting for disordered renal function. Removal of ACCUPRIL, which crosses the placenta, from the neonatal circulation is not significantly accelerated by these means. No teratogenic effects of ACCUPRIL were seen in studies of pregnant rats and rabbits. On a mg/kg basis, the doses used were up to 180 times (in rats) and one time (in rabbits) the maximum recommended human dose.

PRECAUTIONS

General

Impaired renal function: As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including ACCUPRIL, may be associated with oliguria and/or progressive azotemia and rarely acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine have been observed in some patients following ACE inhibitor therapy. These increases were almost always reversible upon discontinuation of the ACE inhibitor and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some hypertensive patients with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when ACCUPRIL has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of any diuretic and/or ACCUPRIL may be required.

Evaluation of hypertensive patients should always include assessment of renal function (see DOSAGE AND ADMINISTRATION).

Hyperkalemia and potassium-sparing diuretics: In clinical trials, hyperkalemia (serum potassium ≥ 5.8 mmol/L) occurred in approximately 2% of patients receiving ACCUPRIL. In most cases, elevated serum potassium levels were isolated values which resolved despite continued therapy. Less than 0.1% of patients discontinued therapy due to hyperkalemia. Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with ACCUPRIL (see PRECAUTIONS, Drug Interactions).

Cough: Cough has been reported with the use of ACE inhibitors. Characteristically, the cough is nonproductive, persistent, and resolves after discontinuation of therapy. ACE inhibitor-induced cough should be considered as part of the differential diagnosis of cough.

Surgery/anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, ACCUPRIL will block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients

Pregnancy: Female patients of childbearing age should be told about the consequences of second- and third-trimester exposure to ACE inhibitors, and they should also be told that these consequences do not appear to have resulted from intrauterine ACE-inhibitor exposure that has been limited to the first trimester. These patients should be asked to report pregnancies to their physicians as soon as possible.

Angioedema: Angioedema, including laryngeal edema, can occur with treatment with ACE inhibitors, especially following the first dose. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to stop taking the drug until they have consulted with their physician (see WARNINGS).

Symptomatic hypotension: Patients should be cautioned that lightheadedness can occur, especially during the first few days of ACCUPRIL therapy, and that it should be reported to a physician. If actual syncope occurs, patients should be told to not take the drug until they have consulted with their physician (see WARNINGS).

All patients should be cautioned that inadequate fluid intake or excessive perspiration, diarrhea, or vomiting can lead to an

Accupril® (Quinapril Hydrochloride Tablets)

excessive fall in blood pressure because of reduction in fluid volume, with the same consequences of lightheadedness and possible syncope.

Patients planning to undergo any surgery and/or anesthesia should be told to inform their physician that they are taking an ACE inhibitor.

Hyperkalemia: Patients should be told not to use potassium supplements or salt substitutes containing potassium without consulting their physician (see PRECAUTIONS).

Neutropenia: Patients should be told to report promptly any indication of infection (eg, sore throat, fever) which could be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with ACCUPRIL is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions

Concomitant diuretic therapy: As with other ACE inhibitors, patients on diuretics, especially those on recently instituted diuretic therapy, may occasionally experience an excessive reduction of blood pressure after initiation of therapy with ACCUPRIL. The possibility of hypotensive effects with ACCUPRIL may be minimized by either discontinuing the diuretic or cautiously increasing salt intake prior to initiation of treatment with ACCUPRIL. If it is not possible to discontinue the diuretic, the starting dose of quinapril should be reduced (see DOSAGE AND ADMINISTRATION).

Agents increasing serum potassium: Quinapril can attenuate potassium loss caused by thiazide diuretics and increase serum potassium when used alone. If concomitant therapy of ACCUPRIL with potassium-sparing diuretics (eg, spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes is indicated, they should be used with caution along with appropriate monitoring of serum potassium (see PRECAUTIONS).

Tetracycline and other drugs that interact with magnesium: Simultaneous administration of tetracycline with ACCUPRIL reduced the absorption of tetracycline by approximately 28% to 37%, possibly due to the high magnesium content in ACCUPRIL tablets. This interaction should be considered if coprescribing ACCUPRIL and tetracycline or other drugs that interact with magnesium.

Lithium: Increased serum lithium levels and symptoms of lithium toxicity have been reported in patients receiving concomitant lithium and ACE inhibitor therapy. These drugs should be co-administered with caution, and frequent monitoring of serum lithium levels is recommended. If a diuretic is also used, it may increase the risk of lithium toxicity.

Other agents: Drug interaction studies of ACCUPRIL with other agents showed:

- Multiple dose therapy with propranolol or cimetidine has no effect on the pharmacokinetics of single doses of ACCUPRIL.
- The anticoagulant effect of a single dose of warfarin (measured by prothrombin time) was not significantly changed by quinapril coadministration twice-daily.
- ACCUPRIL treatment did not affect the pharmacokinetics of digoxin.
- No pharmacokinetic interaction was observed when single doses of ACCUPRIL and hydrochlorothiazide were administered concomitantly.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Quinapril hydrochloride was not carcinogenic in mice or rats when given in doses up to 75 or 100 mg/kg/day (50 to 60 times the maximum human daily dose, respectively, on a mg/kg basis and 3.8 to 10 times the maximum human daily dose when based on a mg/m² basis) for 104 weeks. Female rats given the highest dose level had an increased incidence of mesenteric lymph node hemangiomas and skin/subcutaneous lipomas. Neither quinapril nor quinaprilat were mutagenic in the Ames bacterial assay with or without metabolic activation. Quinapril was also negative in the following genetic toxicology studies: *in vitro* mammalian cell point mutation, sister chromatid exchange in cultured mammalian cells, micronucleus test with mice, *in vitro* chromosome aberration with V79 cultured lung cells, and *in vivo* cytogenetic study with rat bone marrow. There were no adverse effects on fertility or reproduction in rats at doses up to 100 mg/kg/day (60 and 10 times the maximum daily human dose when based on mg/kg and mg/m², respectively).

Pregnancy

Pregnancy Categories C (first trimester) and D (second and third trimesters): See WARNINGS, Fetal/Neonatal Morbidity and Mortality

Nursing Mothers

It is not known if quinapril or its metabolites are secreted in human milk. Quinapril is secreted to a limited extent, however, in human milk, caution should be exercised when ACCUPRIL is given to a nursing mother.

Geriatric Use

Elderly patients exhibited increased area under the plasma concentration time curve (AUC) and peak levels for quinaprilat compared to values observed in younger patients; this appeared to relate to decreased renal function rather than to age itself. In controlled and uncontrolled studies of ACCUPRIL where 918 (21%) patients were 65 years and older, no overall differences in effectiveness or safety were observed between older and younger patients. However, greater sensitivity of some older individual patients cannot be ruled out.

Pediatric Use

The safety and effectiveness of ACCUPRIL in children have not been established.

ADVERSE REACTIONS

ACCUPRIL has been evaluated for safety in 4960 subjects and patients. Of these, 3203 patients, including 655 elderly patients, participated in controlled clinical trials. ACCUPRIL has been evaluated for long-term safety in over 1400 patients treated for 1 year or more.

Adverse experiences were usually mild and transient.

Discontinuation of therapy because of adverse events was required in 4.7% of patients treated with ACCUPRIL in placebo-controlled hypertension trials.

Adverse experiences probably or possibly related to therapy or of unknown relationship to therapy occurring in 1% or more of the 1563 patients in placebo-controlled hypertension trials who were treated with ACCUPRIL are shown below.

Adverse Events in Placebo-Controlled Trials

	ACCUPRIL (N = 1563) Incidence (Discontinuation)	Placebo (N = 579) Incidence (Discontinuation)
Headache	5.6 (0.7)	10.8 (0.7)
Dizziness	3.9 (0.8)	2.6 (0.2)
Fatigue	2.6 (0.3)	1.0
Coughing	2.0 (0.5)	0.0
Nausea/Vomiting	1.4 (0.3)	1.9 (0.2)
Abdominal Pain	1.0 (0.2)	0.7

See PRECAUTIONS, Cough.

Clinical adverse experiences probably or possibly related, or of uncertain relationship to therapy, occurring in 0.5% to 1.0% (except as noted) of the patients treated with ACCUPRIL (with or without concomitant diuretic) in controlled or uncontrolled trials (N = 4397) and less frequent, clinically significant events seen in clinical trials or post-marketing experience (the rarer events are in italics) include (listed by body system):

General: back pain, malaise

Cardiovascular: palpitation, vasodilation, tachycardia, heart failure, hyperkalemia, myocardial infarction, cerebrovascular accident, hypertensive crisis, angina pectoris, orthostatic hypotension, cardiac rhythm disturbances

Gastrointestinal: dry mouth or throat, constipation, gastrointestinal hemorrhage, pancreatitis, abnormal liver function tests

Nervous/Psychiatric: somnolence, vertigo, syncope, nervousness, depression

Integumentary: increased sweating, pruritus, exfoliative dermatitis, photosensitivity reaction

Urogenital: acute renal failure

Other: amblyopia, pharyngitis, sinusitis, bronchitis, agranulocytosis, thrombocytopenia

Fetal/Neonatal Morbidity and Mortality

See WARNINGS, Fetal/Neonatal Morbidity and Mortality.

Angioedema: Angioedema has been reported in patients receiving ACCUPRIL (0.1%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with ACCUPRIL should be discontinued and appropriate therapy instituted immediately (see WARNINGS).

Clinical Laboratory Test Findings

Hematology: (See WARNINGS)

Hyperkalemia: (See PRECAUTIONS)

Creatinine and blood urea nitrogen: Increases (71.25 times the upper limit of normal) in serum creatinine and blood urea nitrogen were observed in 2% and 2%, respectively, of patients treated with ACCUPRIL alone. Increases are more likely to occur in patients receiving concomitant diuretic therapy than in those on ACCUPRIL alone. These increases often remit on continued therapy.

*In some patients, the antihypertensive effect may diminish toward the end of the once-daily dosing interval. In such patients, an increase in dosage or twice-daily administration may be warranted.

Human injuries following jellyfish stings

Joseph W. Burnett, M.D.

Dr. Burnett is professor and chairman, Department of Dermatology, University of Maryland School of Medicine. Reprints: Dr. Burnett, 405 West Redwood St., 6th Floor, Baltimore, MD 21201.

There are approximately 500,000 jellyfish stings every year in the Chesapeake Bay. Dr. Burnett describes the mechanism of jellyfish stings, venom components, types of reactions, diagnosis, and therapy.

Noxious jellyfish occur in both brackish or salt water bodies. These animals possess tentacles with intracytoplasmic organelles (nematocysts) containing coiled toxin-coated threads. These organelles are located in the outermost epithelial layer when in the "fire ready" position and can be contracted by a fibrillar network to an unexposed position when the animal apparently is not feeding or is not endangered. Some recent evidence indicates that the wiggling behavior of nearby prey may be an important factor in controlling nematocyst release.¹ Other evidence demonstrates that the thread (nema) everts when chemically triggered. Since it is propelled with a force of approximately two to five pounds per square inch, the thread with its viscous venom penetrates to the nerve and vascular rich dermis. Most jellyfish contain several nematocyst types clustered in moveable groups or "batteries" on the tentacle's outer epithelial layer. Some of the organelles adhere to prey, but others possess different injurious toxins for defense or predation.

The commonest toxic jellyfish in Maryland is the sea nettle (*Chrysaora quinquecirrha*)—the summer Chesapeake Bay jellyfish (Figure 1). Another local species is *Cyanea capillata* (lion's mane), an animal made famous by a Sherlock Holmes detective story. This coelenterate is found in the bay during the winter and spring and in the ocean, along with the sea nettle, in the summer. The presence of *Physalia physalis* (Portuguese man-of-war) is very unusual in Maryland waters.

The rate of absorption of jellyfish venom in man varies with local muscular action (muscle pump) and the content or concentration of the venom. The potency of the venom to produce human cutaneous pain, mouse lethality, hemolysis, or dermonecrosis is species dependent. In all of the above parameters, the Portuguese man-of-war venom is considerably more active than that of the sea nettle. However, sea nettle venom has been studied more because it is collected from the most abundant, predictably occurring, venomous marine animal in the world.

Jellyfish stings are common with an estimated 500,000 annual envenomizations occurring in the Chesapeake Bay and 60,000 to 200,000 in

Figure 1. Adult sea nettle medusa (*Chrysaora quinquecirrha*). Reprinted with permission from *Archives of Dermatology* 1968; 98:587-9. Copyright 1968, American Medical Association.

Florida. Venom injury in humans occurs either by toxic or irritant reactions or by immunological or allergic mechanisms.² Immunological reactions appear to be humoral (B-cell) and cell-mediated (T-cell) phenomena. Toxic reactions occur in all individuals, follow every exposure, and are directly dose related. Immunological reactions, on the other hand, require prior exposure to the venom, do not occur in all people, and are not always dose related. It should be emphasized that both the allergic and toxic

reactions can occur concurrently, be serious, be delayed, and alter states of consciousness. Allergic reactions to venoms are not necessarily progressively serious with each exposure and can follow contact with venom from cross-reacting animals.

Venom components

Jellyfish venoms are polypeptide mixtures with many enzymatic actions.^{3,4} The sea nettle has two types of tentacles: peripheral lace-like fishing tentacles and central mesenteric tentacles. Although the nematocyst component of these structures is very similar, the molecular weight of their venoms differs. The active nematocyst components weighing 100 to 190 kilodaltons are similar in the two tentacles.^{5,6} Crude nematocyst venom is viscous and contains a collagenase, a hyaluronidase, nucleases, proteases and phosphatases.^{3,4} Histamine, histamine releasers, and serotonin-like and kinin-like products are also present.^{3,4,7} The dosage of venom delivered to the victim is impossible to calculate since the number of nematocysts available in the fire-ready position and the spacing of these structures in batteries on the tentacle are variable.⁸ Measuring the length of the tentacle-victim's skin contact can be a helpful but inexact finding.⁹

Fatal reactions

Mouse lethality occurs by injury to any of three different organ systems in a dose-dependent manner. Large doses of

sea nettle venom produce a cardiotoxic reaction on the myocardium, Purkinje's fibers, and the coronary vasculature giving varying degrees of heart block and ventricular standstill within seconds to a few hours. Intermediate venom doses depress the respiratory center within twenty-four hours. Finally, smaller doses cause death from renal damage and hyperkalemia after one to two days.^{3,4} The use of verapamil can prevent cardiotoxic death in animals, yet the animals will succumb in several hours to respiratory depression.¹⁰ Verapamil can instantly reverse the cardiac arrhythmia caused by jellyfish venom.¹¹

A similar death occurs in man following jellyfish stinging.¹² Several fatalities occur annually after box-jellyfish envenomizations in the Indo-Pacific region and, in 1988, two deaths on the American Atlantic coast following Portuguese man-of-war envenomization were recorded.^{13,14} These deaths were thought to be due to a calcium and/or sodium ionic transfer defect.^{3,5,10}

Anaphylaxis, the most serious allergic reaction, rarely occurs from jellyfish stings.¹⁵ Clinical differentiation of a venom-induced cardiorespiratory toxic death from anaphylaxis can be difficult since, in either instance, the patients have cardiovascular collapse several minutes after the tentacular contact.

Systemic reactions

Systemic reactions to jellyfish envenomizations include nausea, vomiting, muscle cramps, diarrhea, dizziness, unfocused vision, diaphoresis, fainting, coma, convulsions, muscular spasms, and respiratory acidosis (if the sting is on the thorax).^{16,17} An Irukandji reaction occurs after envenomization from several carybdeid jellyfish in northeastern Australia. While no American cases have yet been reported, we suspect that rare unrecognized cases occur. This reaction follows a minor painful sting. After five to forty minutes, a boring pain begins in the lower trunk spreading quickly to the chest and thigh. Alternating tightness and waves of excruciatingly severe muscle pain intensify over a few minutes. There are increased sighing respirations, restlessness, tremor, anxiety, headache, localized or general piloerection, sweating, pallor, cyanosis, oliguria, tachycardia, nausea, hypertension, pulmonary edema with left ventricular dilatation, and feelings of imminent death lasting one to two days.¹⁸ The symptomatology can resemble a catecholamine crisis, and some symptoms are reversed with phentolamine therapy.

Two years ago, a healthy male, who was envenomed on the forearm in Florida, suffered from local pain and profound vomiting over a period of several hours. His liver enzymes (SGOT—serum glutamic oxaloacetic transaminase, SGPT—serum glutamic pyruvic transaminase) were elevated for more than sixteen days, and he had elevated equal titers of serum IgG (immunoglobulin G) to *Physalia* and *Chiropsalmus* venoms.

Local reactions

The local reactions produced by jellyfish stings are painful, linear, erythematous, urticarial lesions wherever tentacular

contact has occurred (**Figure 2**). Corneal lesions are especially painful.¹⁹ Cutaneous pain occurs almost instantly, reaching an apex within a few minutes and persisting for several hours. The eruptions may be bullous or dramatically edematous, may be delayed for several hours, may persist for several months, or may recur without further stings.^{16,20-23} The recurrent eruptions are similar in severity but are pruritic, not painful. The recurrent eruptions appear at four- and thirty-day intervals and last up to twenty-eight days. The number of recurrent attacks can be as many as four, and some of the episodes of eruptions can be accompanied by diarrhea. Immediate erythematous, edematous, urticarial eruptions can appear distant from the site of the sting.²⁴ Two patients have been reported with papular urticarial lesions located on the body away from the envenomization site.¹⁶ Another two patients with exaggerated localized reactions (angioedema) have been recognized; only one of these individuals developed anaphylaxis with subsequent stings.¹⁵ Cases of unusual eruptions following jellyfish envenomizations have occurred in oceanic waters of the eastern United States. None have followed Chesapeake Bay stings, although one patient could have been "primed" there.²³

Examination of skin biopsies from patients with local jellyfish stings, recurrent eruptions, or persistent lesions reveals an inflammatory picture. Specimens from patients with ordinary stings show a chronic lymphocytic infiltrate that is patchy

Figure 2. A 45-hour-old linear vesicular erythematous eruption that appeared at the site of a previous sting inflicted two weeks previously.

and located primarily around the vessels in the upper dermis. The dermal lymphocytes are both helper (T₄-stain) and suppressor (T₈-stain), with the former being more abundant. Examination of patients with recurrent lesions showed a deeper dermal lymphocytic infiltrate. There is no deposition of complement or IgG at the dermal epidermal junction or around the vessels. The pathologic finding observed on biopsied specimens of persistent lesions is a granuloma.²² Contact urticaria due to jellyfish tentacles has also been reported in humans.²⁵

Other reactions

Post-episode dermatitis. Local stings may be followed by recurrent herpes simplex or granuloma annulare at the site of the wound.¹⁶

Long-term reactions. Chronic reactions at the wound include hyperpigmentation (postinflammatory or tattooing from the jellyfish), keloids, contractions, fat atrophy, and vasospasm with gangrene.^{26,27} Two cases of temporary mononeuritis multiplex involving a nerve near, but not in, the stung area have been reported subsequent to coelenterate envenomizations.^{28,29} Patients with autonomic nerve paralysis with a distended abdomen, urinary bladder dilatation, impotency, an inability to produce tears or urinate,³⁰ diplopia, and ataxia¹⁶ have been reported. The six cases of vasospasm, contracture, and gangrene occurred in the Indo-Pacific region, and most of these individuals still have significant disability.

Reaction from jellyfish ingestion. In countries where dry jellyfish are served as food, postprandial urticaria and gastrointestinal symptoms or contact dermatitis have resulted.²⁵

Systemic pathology. The skin is not the only organ showing pathological changes. Centrilobular hepatic necrosis and proximal renal tubular damage have been detected in experimental animals after sublethal injections.³¹

Sexual susceptibility. Females have a predilection for some jellyfish envenomization syndromes. Although more men than women swim, five of the six cases of vasospasm with gangrene and 80 percent of the recurrent eruptions following single envenomizations from jellyfish stings have been females. Most of the patients with persistent cutaneous lesions and the solitary cases of fat atrophy and of granuloma annulare were females. Both cases of papular urticaria and the patient who had a distant eruption following a jellyfish sting were women. Only time will tell whether this trend persists.

Jellyfish-sting reactions in abnormal or medicated patients. Very little information is available about the reaction of abnormal or medicated patients stung by jellyfish. Pregnant women or patients receiving weekly ragweed immunization medication appear to respond normally.³² One woman taking 60 mg prednisone noticed that the linear eruption following tentacle contact was pain-free and delayed two days. She, however, suffered from four recurrent episodes related to that sting.²³

Immunology

Jellyfish venoms can affect both humoral and cell-mediated immunity in man. Envenomed swimmers develop IgM

and IgG antibodies that may persist for many years.³³ Lymphokine release from circulating peripheral blood leukocytes, leukocyte stimulation, or suppression of natural killer cell enhancement have been demonstrated in convalescing patients, especially those with recurring lesion.^{23,34,35} There is cross reactivity of antibody production and increased T-cell activity induced by venoms of different jellyfish. Systemic immunosuppression in a human volunteer was detected after injecting large intradermal doses of venom.³⁶ The interplay of this immunosuppression with that received from ultraviolet light at the beach is not known.

Diagnosis

Identification of jellyfish envenomization is often obvious after examining the patient and obtaining a history. Diagnosis of the offending animal is helpful and can be assumed by having knowledge of the usual fauna at the place and time of the envenomization. The type of species can be confirmed by recognizing nematocysts on biopsied skin or on stratum corneum scrapings. Clinical corroboration of a sting can be obtained by rubbing one's hands on the area and then having the examiner touch his or her own skin to detect secondary stings. Serologic tests can be performed on specific jellyfish exposure.³¹ Cross-reacting antibodies have been reported after envenomizations, yet venom of the offender appears to elicit the highest titer. T-cell studies have been performed after jellyfish envenomization but are experimental.³⁴

Therapy

Anaphylaxis from jellyfish envenomizations should be treated in the customary manner by maintaining the airway and cardiovascular system. The insertion of an intravenous life-line and administration of epinephrine is essential. Treatment of a serious cardiotoxic venom reaction includes similar measures except that intravenous verapamil should be considered.¹⁰ Nifedipine is not as effective as verapamil, and diltiazem is nonefficacious. The only effective specific antisera available are directed toward Australian box-jellyfish envenomizations. This preparation has been helpful for stings by those species and are potentiated by verapamil.³⁷ All patients should be reassured and placed at rest. The injured part is splinted to reduce the pump action of nearby muscles to localize the venom. Application of ice cubes or counterirri-

tants elsewhere on the body can be helpful for pain relief. Analgesia must be obtained systemically since no topical preparation rapidly penetrates the epidermis. Heat as therapy in jellyfish envenomization is contraindicated since it might increase the systemic uptake of venom.²⁹

No certain method of deactivating unfired nematocysts within tentacle fragments on the victim's skin has been developed. However, previous studies have indicated that the use of preparations such as vinegar or baking soda pastes may be partially beneficial.^{38,39} Vinegar should be employed for man-of-war stings, and baking soda slurries for those induced by the nettle or the lion's mane jellyfish. These preparations should not be administered prior to maintaining life support systems. Once the patient is stable and the tentacle fragments inactivated, manual removal of any adherent tissue can follow.

Hydroquinone bleaches are used for hyperpigmentation, and keloids are treated in the standard manner. The use of nonsteroidal analgesics in cases of prolonged, persistent reactions or recurrent episodes has not been experimentally proven. Experimentally, piripost (a leukotriene inhibitor) prevented some of the capillary damage produced by the venom.⁴⁰

Mechanical barriers to jellyfish at the beach have been effective in Australia where specialized structures have been designed. Formfitting pajama-like garments are popular with windsurfers in that country to protect them against jellyfish stings. Topical barrier ointments have been tried but are not cosmetically attractive and do not protect the eyes. Observers posted to supervise swimming in the Chesapeake Bay are ineffective because of the dark color of the plankton-rich water.

Conclusions

Noxious jellyfish injure man in a variety of ways. Newer syndromes have been uncovered as investigators have probed the cause of the pathogenesis of jellyfish stings. Death results from toxic or immunological reactions in man. Unusual cutaneous eruptions and systemic effects of the envenomization have been reported. These reactions appear to be species specific, and future therapy will vary according to the envenomizing animal and the pathogenesis of the disorder.

Clinical syndromes produced by jellyfish envenomization

Local reactions

- Toxin-induced to skin, mucosa, and cornea
- Exaggerated local reaction (angioedema)
- Recurrent reactions up to four episodes
- Delayed persistent reactions up to several months
- Distant site reactions
- Local lymphadenopathy

Long-term reactions

- Keloids
- Pigmentation
- Fat atrophy
- Contractions
- Gangrene
- Vascular spasm
- Mononeuritis
- Autonomic nerve paralysis
- Ataxia
- Increased intraocular pressure

Post-episode dermatitis

- Herpes simplex
- Granuloma annulare

Reactions from jellyfish ingestion

- Gastrointestinal symptoms
- Urticaria

Systemic reactions

- Toxin-induced
- Irukandji reaction
- Respiratory acidosis
- Blurred vision
- Monarticular arthralgia and reactive arthritis
- Pronounced vomiting

Fatal reactions

- Toxin-induced
- Immediate cardiac arrest
- Rapid respiratory arrest
- Delayed renal failure
- Anaphylaxis

Kohler HealthCare Consultants

The Practice Management Specialists

... is offering a comprehensive seminar on the NEW OSHA regulations geared toward private practice physicians' offices. Seminars will be conducted on-site at your office. This 2½ hour seminar includes the following:

- In-depth, 120 page, user-friendly manual
- AMA video presentation
- Development of Exposure Control Plan
- Assessment test
- Question/answer period

To schedule an on-site seminar, please contact Janet Howard or Melinda Gustafson at Kohler HealthCare Consultants at (410) 783-4900.

Kohler HealthCare Consultants
One North Charles Street Suite 100 Baltimore, MD 21201

The supportive care unit— Inpatient geriatric rehabilitation: Preliminary data

Mel P. Daly, M.D.; Alan M. Adelman, M.D.;
and Barbara M. Resnick, R.N., M.S.N., C.R.N.P.

Dr. Daly is assistant professor and director, Division of Geriatric Medicine, Department of Family Medicine, University of Maryland. Dr. Adelman is associate professor, Department of Family Medicine, University of Maryland and medical director, Supportive Care Unit, James L. Kernan Hospital. Ms. Resnick is a geriatric nurse practitioner, Supportive Care Unit, James L. Kernan Hospital. Reprints: Mel P. Daly, M.D., James L. Kernan Hospital, 2200 N. Forest Park Ave., Baltimore, MD 21207.

Hospital availability of a comprehensive geriatric rehabilitation service, such as the Supportive Care Unit at the University of Maryland, can help achieve the goals of preserving present levels of function, avoiding losses of function, and restoring independence in the frail elderly.

There is compelling evidence that disability increases with age and that multiple impairments increase significantly after age 75. Estimates of the noninstitutionalized elderly population with limitations in personal and instrumental activities of daily living (ADLs and IADLs) range from 12 percent with ADL limitations lasting more than three months to 25.5 percent or 6.7 million persons with any ADL or IADL limitation.¹ This proportion rises from 19 percent among persons aged 65–74, to 31 percent among persons 75–84 years, and to 55 percent among those over 85 years. Thus, there is a great need to preserve an independent lifestyle for the elderly person to the maximal extent possible. Older persons' needs created by ill health and disability may strain care providers to the point that providers may no longer offer to continue support. Furthermore, there is evidence suggesting that the major determinants of nursing home admission are advanced age, dependency in ADLs and IADLs, use of an aid for ambulation, and impaired mental status.^{2,3}

Loss of functional independence is a common pathway for many disorders in older persons, especially those hospitalized for an acute illness. Imposed bed rest further complicates and exacerbates the decline in functional status.⁴ Older people frequently incur major functional setbacks stemming from in-hospital treatment and immobilization with resultant deconditioning. The cardiovascular and musculoskeletal systems are most adversely affected. It is estimated that daily losses of 1 to 1.5 percent of muscle strength occur with bed rest. This is a decline of 10 percent in strength after one week for an older person who is at threshold strength for climbing stairs or getting to the bathroom, and this decline in strength may make the difference between dependence and independence.⁵

Rehabilitation is a continuing comprehensive team effort to restore an individual to his/her former functioning and environmental status or to

maintain or maximize remaining function. The goal is to limit functional losses and direct energies toward maximizing resources such that a patient can be returned to the least restrictive discharge environment possible. Even very elderly individuals, including those with chronic disease, can participate in exercise programs and show improvement in cardiovascular function, fitness, strength, and flexibility.⁶⁻⁸

The supportive care unit

Since 1987, the Department of Family Medicine, Division of Geriatric Medicine, has managed a model geriatric rehabilitation program, specifically dedicated to the rehabilitation of frail elderly individuals. It is a continuation of a Robert Wood Johnson-sponsored demonstration project designed to act as a bridge between acute and long-term care for elderly hospitalized patients.⁹ The program is unique in that, while it is housed in an acute care hospital, it offers step-down care at a lower per diem cost, yet patients receive the intensity of care comparable to acute hospital ward patients. The beds are licensed under the long-term care system at a "chronic level of care" and are used to house for rehabilitation, patients who have had an acute medical or surgical event, with the aim of discharge to the community. The categories of patients that are appropriate for this chronic level of care include those who usually require more frequent attendance of a geriatrician than is available in skilled nursing homes. These patients require regular examinations and judgment decisions from a physician and also require continued skilled nursing services at a level ordinarily not available in a skilled nursing home. Potential candidates are referred from hospitals, home health care agencies, private physicians, and nursing homes. Each candidate is evaluated by a liaison rehabilitation nurse who visits the patient and assesses the medical reason for rehabilitation and the patient's physical condition, medical stability, mental status, motivation, family support, present functional status, and estimated potential for rehabilitative/restorative gains.

The unit is run using a medical model and, upon admission, the patient is evaluated by a multidisciplinary team including physician, nurse, social worker, physical therapist, occupational therapist, and speech/language pathologist when indicated. Residents from the Department of Family Medicine are attached to the unit during their compulsory second-year rotation in geriatrics. Students from all disciplines may choose to spend clinical attachments here also.

Specific treatment plans for functional improvement are established and an estimated length of stay is agreed on. The discharge plan is tailored to meet the patient's needs and takes into consideration the willingness and ability of the patient's family (or other caregiver) to provide support and care if needed. An intensive program of therapy sessions is instituted. Progress is constantly monitored by the interdisciplinary team. On discharge, the Supportive Care Unit links the patient to community resources including in-home aides, skilled nursing assistance, companion services, home health equipment, and other specialized services. Follow-up medi-

cal care is usually through the patient's primary physician. If return home is no longer practical, then alternatives are arranged.

Results

In the unit's three years of existence, over 500 patients have been admitted. The mean age was 77.3 years (± 8.96), and the oldest patient was 101 years old. The majority of patients were female, white, and widowed (Table 1). Women were statistically more likely to be widowed than their male counterparts (74 percent vs 34 percent, $p < .001$). At the time of admission, nearly all patients either lived alone or with family or relatives.

The major reason for admission was rehabilitation after an acute orthopaedic procedure (68.7 percent). This included patients admitted for rehabilitation after fracture repairs (primarily hip) and after total hip and knee replacements. Other diagnoses included stroke (13.2 percent), amputation (4.0 percent), rehabilitation after a cardiac event (2.6 percent), or debilitating arthritis (2.9 percent). Forty patients (8 percent) were admitted for rehabilitation after prolonged hospital stays for acute medical events that resulted in severe functional deconditioning. This group also included patients with other neurological problems such as multiple sclerosis and Guillain-Barré syndrome. The mean length of stay for all patients was 22 days ± 14 , with longer stays for patients admitted for rehabilitation after a stroke or because of deconditioning than for those admitted for rehabilitation after an orthopaedic pro-

Table 1. Demographic characteristics of patients

		N	Percent
Sex	Female	422	77.3

	Arthritis	16	2.9
	Cardiac	14	2.6

cedure or amputation (30 days \pm 16 vs 20 days \pm 12, $p < 0.05$). On admission, patients had evidence of moderate to severe functional impairment (Table 2). Patients admitted for rehabilitation after a stroke were the most functionally impaired (mean Barthel score: 41 ± 15.6) and were significantly more impaired than the orthopaedic (58 ± 10), deconditioned (53 ± 17), cardiac (52 ± 12), and arthritic (51 ± 13) patients. The mean Barthel¹⁰ measure of functional status improved by close to 30 points by the time of discharge (55.7 ± 13.6 to 82.4 ± 18.3 , $p < 0.05$).

Eighty-five percent of patients admitted to the unit were discharged home, with the majority of these returning to live with family or relatives. Those patients with more severe functional issues on admission had longer lengths of stay ($r = 0.26$, $p < 0.05$). Patients not discharged home were more likely ($p < 0.05$) to have been admitted for rehabilitation after a stroke (71 percent home) or cardiac event (64 percent home). More than 80 percent of patients in all other diagnostic groups were discharged home. The greatest improvement in functional status was seen in the orthopaedic patients (mean discharge Barthel score: 87 ± 13), followed by patients with amputations (85 ± 19), deconditioned patients (80 ± 19), arthritic patients (79 ± 22), cardiac patients (77 ± 22), and stroke patients (61 ± 23). Follow-up data collection is ongoing but the majority of patients (80 percent) continued to be at home at each follow-up interval (Table 2). Approximately 5 to 10 percent of patients are admitted to skilled nursing facilities at each interval of follow-up, and 4 to 7 percent of these patients have expired. The mean Barthel score remains unchanged over twenty-four months of follow-up.

Table 2. Patient outcomes after admission to supportive care						
	Admission (N = 546)	Discharge (N = 541)	2-Month (N = 437)	6-Month (N = 322)	12-Month (N = 216)	24-Month (N = 33)

Discussion

These preliminary data show that the Supportive Care Unit has been highly successful. Over 85 percent of the frail elderly people admitted had significantly improved on discharge to homes. The majority of these patients maintained their level of functional improvement over a two-year follow-up interval. Eighty percent of the patients who are still living were in their own homes at each follow-up interval up to two years after discharge. These numbers are better than those that have been previously reported in prospective studies of elderly patients. In a study of patients followed for a year after rehabilitation following stroke, 49 percent returned home and 77 percent of survivors were still at home a year later.¹¹ In

another study following patients with fractures of the proximal femur, 69 percent of the treatment group were living at home at one year and 6 percent were in institutions.¹² A study of frail elderly patients admitted to a geriatric rehabilitation unit in a community hospital found that 67 percent were living in the community six months after discharge.¹³ These descriptive data are further supported by two randomized studies^{14,15} of the effectiveness of geriatric rehabilitative care. Both studies concluded that the treatment of selected elderly patients in a specialized geriatric rehabilitation unit improves function, reduces the risk of nursing home placement, and may reduce mortality. These preliminary data also support evidence showing that age itself, when controlled for co-morbidity and extensive neurologic impairment, is not a clinically relevant factor in stroke rehabilitation outcome.¹⁶

The need for geriatric rehabilitation units such as the Supportive Care Unit is becoming more critical since the introduction of the Medicare Prospective Payment System (PPS) and increasing costs under DRGs (diagnostic-related groups). Such changes have resulted in more early discharges of post hip surgery patients to nursing homes, with hospital stays decreasing from 21.9 days to 12.6 days.^{17,18} A disquieting effect of this early discharge policy has been a dramatic increase in patients remaining indefinitely in community nursing homes. One third of all patients studied who were alive at one year resided in a nursing home compared with only 9 percent prior to PPS.

A crucial question for those committed to individualized rehabilitative care for older patients will be: Have we done enough—soon enough—to preserve an autonomous inde-

pendent lifestyle for those who could benefit. A goal for the future should be that every general hospital should have access to a comprehensive geriatric rehabilitation service at both the acute and extended care levels.¹⁹ Perhaps, as

suggested by Dr. Franklin Williams and others,²⁰ older patients admitted to the hospital for acute services should automatically have a geriatric rehabilitation team consultation. Then, every effort can be directed at preserving present levels of function, avoiding losses of function, and restoring independence. Perhaps then, the individuality and autonomy of older persons will be respected and preserved.¹⁹

Unusual articular manifestations in chronic renal disease

Charles S. Resnik, M.D.; Bruce I. Reiner, M.D. ; and Jeremy W. R. Young, M.D.

From the Department of Radiology, University of Maryland Medical System, where Dr. Resnik is an associate professor, Dr. Reiner is a former resident, and Dr. Young is an associate professor and chief of Diagnosis. Reprints: Charles S. Resnik, M.D., Department of Diagnostic Radiology, University of Maryland Medical System, 22 South Greene St., Baltimore, MD 21201

We report thirteen patients with chronic renal disease who demonstrate one or more sites of arthropathy including three with combined spine and shoulder changes.

Various skeletal abnormalities have been described in patients with chronic renal failure on long-term hemodialysis. These include renal osteodystrophy (secondary hyperparathyroidism, osteomalacia, and osteosclerosis), osteoporosis, soft tissue calcifications, osteonecrosis, and crystal-induced arthritis.^{1,2} These patients are also at increased risk for the development of pyogenic infections of bones and joints.³

Two additional types of arthropathy have been described in these patients. The first is a destructive, rapidly progressive spondyloarthropathy resembling an infectious spondylitis.³⁻⁸ The second consists of erosions at various sites in the appendicular skeleton, with a predilection for the articulations of the hands and wrists, shoulders, and knees.^{2,9-11}

Despite an increasing number of reports describing these arthropathies, only one illustrates a combination of spondyloarthropathy and arthropathy of the hands,¹² and none describe simultaneous spine and shoulder involvement. We report thirteen patients with chronic renal disease who demonstrate one or more sites of arthropathy including three with combined spine and shoulder changes.

Materials and methods

The thirteen patients consisted of seven males and six females ranging in age from 15 to 68 years (mean: 52 years). The patients had been on dialysis from 1 to 14 years (mean: 7 years) by the time that articular abnormalities were identified.

Available radiographs of the hands, wrists, shoulders, and spine were reviewed retrospectively for erosive changes not typically seen in the setting of chronic renal failure. No patients were found to be rheumatoid factor positive or to exhibit clinical and laboratory stigmata of a seronegative arthropathy. Percutaneous or open-needle biopsy was performed on

Figure 1. Shoulder arthropathy. Erosions are present involving the humeral head, greater tuberosity, and glenoid. More familiar erosion of the distal clavicle is also present.

Figure 2. Shoulder arthropathy. There is erosion of the glenoid articular surface with destruction of much of the humeral head resembling neuropathic arthropathy.

all five cases of spondyloarthropathy to exclude superimposed infection.

Results

Five of the thirteen patients demonstrated glenohumeral joint arthropathy with articular erosions involving the humeral head in all five, the greater tuberosity in three, and the glenoid in four (**Figure 1**). Two patients developed a destructive arthropathy resembling neuropathic disease (**Figure 2**).

Seven of the thirteen patients demonstrated an erosive arthropathy involving the hands, wrists, or both. Erosions were present in the distal interphalangeal joints in six patients, the proximal interphalangeal joints in three, the metacarpophalangeal joints in six, and intercarpal joints in four. Three patients developed a destructive arthropathy involving at least one joint (**Figure 3**).

Five of the thirteen patients demonstrated a destructive spondyloarthropathy characterized by disc destruction, endplate erosion, and vertebral body collapse (**Figure 4**). One case consisted solely of an erosive arthropathy involving a cervical facet joint. There were two cases in each of the cervical, thoracic, and lumbar regions.

In three of the thirteen patients, spondyloarthropathy was present concurrent with arthropathy of the shoulder (**Figures 2 and 4**). One of these patients also demonstrated arthropathy in the hands and wrists.

Discussion

The association of chronic renal failure with skeletal disease has been known for over a century, yet the entity of destructive noninfectious spondyloarthropathy has only recently been documented.³⁻⁸ Multiple factors have been considered in its pathogenesis including hyperparathyroidism¹³ and deposition of iron,¹⁴ aluminum,¹⁵ calcium oxalate,¹⁶ hydroxyapatite,^{2,5} calcium pyrophosphate,³ or amyloid associated with beta-2 microglobulin.¹⁷⁻²⁰

Radiographic changes consist of a rapidly progressive spondyloarthropathy with marked reduction of the disc space, destruction and sclerosis of the adjacent endplates, and absence of osteophytosis and paravertebral soft tissue mass. Clinically, these patients present with local pain. Rarely, there can be associated compromise of the spinal canal. No evidence of infection is found on biopsy, and radiologic deterioration continues in spite of antibiotic therapy.

A second distinct entity consists of an erosive arthropathy involving the appendicular skeleton, often mimicking rheumatoid arthritis.^{11,21} The hands and wrists tend to have the greatest frequency of involvement.^{2,22} Lytic bone lesions, subchondral cysts, and larger carpal cysts may be prominent features.²³⁻²⁵ Early hypotheses for the mechanism of the erosive changes included an extension of subperiosteal resorption along the shaft of a bone into the adjacent joint¹¹ or a pyrophosphate-like arthropathy.²⁶

The beta-2 microglobulin component of dialysis-related

Figure 3. Hand arthropathy. Poorly defined erosions are present at distal interphalangeal, proximal interphalangeal, and metacarpophalangeal joints. There is destruction of the distal interphalangeal joint of the index finger. Extensive subperiosteal bone resorption is also evident at multiple sites.

Figure 4. Spondyloarthropathy. Same patient as in Figure 2. There is disc destruction, endplate erosion, and partial collapse of vertebral bodies.

amyloid protein is now recognized as a cause of carpal tunnel syndrome, and its presence has been found to increase with increasing duration of hemodialysis.²⁰ Appendicular erosions and lytic bone lesions are now known to be related to the presence of this amyloid material.^{24,25,27} Amyloid deposits have also been found within discs and peridiscal ligaments in the setting of destructive spondyloarthropathy,¹⁸⁻²⁰ suggesting this as a common pathogenesis for appendicular and axial arthropathies.

The concurrent presence of spondyloarthropathy and appendicular arthropathy in three of our patients supports this theory.

Chorionic villus sampling: The University of Maryland experience

W. Allen Hogge, M.D.; Joan S. Hogge, M.S.; C. Lynn Keene, M.D.; Marcos Pupkin, M.D.; Stuart Schwartz, Ph.D.; Colleen McGillis, M.S.; Christine Hartlove, B.S.; Carlyle Crenshaw, Jr., M.D.; and Maimon M. Cohen, Ph.D.

The University of Maryland was the first program in the state to offer chorionic villus sampling (CVS). Since the program's beginning in 1984, 998 patients have been seen with successful sampling in 99.1 percent, using both transcervical and transabdominal approaches. The overall loss rate was quite low (2.3 percent), and no increased risk of birth defects was seen. These observations demonstrate that CVS provides a safe and accurate alternative to amniocentesis.

From the Division of Human Genetics, Department of Obstetrics and Gynecology, University of Maryland, where Dr. Hogge is associate professor and director, Prenatal Diagnostic Center; Ms. Hogge is a genetic counselor; Dr. Keene is formerly assistant professor of obstetrics and gynecology, and presently is director, Maternal Fetal Medicine, Roanoke Memorial Hospital, Roanoke, VA; Dr. Pupkin is professor and vice chairman; Dr. Schwartz is associate professor and director, Cytogenetics Laboratory; Ms. McGillis is formerly a summer student intern and presently a student at the University of California, Berkley, CA; Dr. Crenshaw is professor and chairman; and Dr. Cohen is professor and director of the Division of Human Genetics. Reprints: W. A. Hogge, M.D., Department of Obstetrics and Gynecology, University of Maryland, 22 S. Greene St., Room N6W40, Baltimore, MD 21201.

In the decade since the introduction of chorionic villus sampling (CVS) as a clinical diagnostic tool, the procedure rapidly has been accepted as a first-trimester alternative to amniocentesis. Over these ten years, several studies have provided information on the safety, efficacy, and reliability of CVS.¹⁻⁴ We present our experience at the University of Maryland in the first seven years of the CVS program—the first program in Maryland offering this technology.

Materials and methods

This study details the program's results from March 1984 through February 1991. Of the 998 CVS procedures performed, 978 were first-trimester procedures on singleton pregnancies and comprise the study group of this report. The major indication for the procedure was advanced maternal age, accounting for over 95 percent of the procedures performed. First-trimester CVS also was performed in nine multiple pregnancies (eight twins; one set of triplets). Eleven late CVS procedures (greater than 13 weeks gestational age) were performed, with the major indication being an ultrasound-detected fetal malformation.

At the time of the CVS, gestational age was determined by a combination of the last menstrual period and standard ultrasonographic biometric parameters. For patients in whom the gestational age determined by ultrasonography was discrepant by more than two weeks, gestational age by ultrasound was used.

CVS was performed from the ninth to the thirteenth week of gestational age, using either a transcervical or a transabdominal approach. Transcervical samplings were obtained using a 16-gauge polyethylene catheter (**Figure**) as previously described by Hogge et al and by Ferguson et al.^{5,6} In no instance were greater than three attempts made, and a new catheter was used for each insertion.

Transabdominal CVS was performed using a 20-gauge spinal needle. Using a sterile ultrasound-guided technique, either a biopsy-guide or a freehand approach was employed, depending on operator preference. After the needle was placed into the placenta, aspiration was performed using a 20 ml syringe containing 1–2 ml of Hanks balanced salt solution. Approximately 15 ml of suction was applied, and the needle was moved backward and forward vigorously within the placenta.

There were no specific contraindications to chorionic villus sampling except for an inaccessible placental location; most commonly, CVS was not attempted if there was a severely retroverted uterus with a posterior placenta. In the presence of an active herpes infection, a transabdominal approach was used, if technically possible. If not, the procedure was not performed.

An adequate sample was defined as at least 10 mg wet weight of villus material. For chromosome analysis, both direct preparations, and cultured cells were examined, but only culture results were reported to the patient.

Results

There were 978 first-trimester procedures performed, 744 of which were transcervical CVS and 234 were transabdominal. The majority of transcervical CVS procedures (84.5 percent) were successful on the first attempt, with only four patients requiring three attempts to obtain a sample. Successful sampling was performed in 99.2 percent of patients undergoing transcervical CVS. For transabdominal CVS, a sample was obtained on the first attempt in 88.5 percent; in three patients, sampling was unsuccessful by the transabdominal approach. Overall, the successful sampling rate with transabdominal CVS was 98.7 percent.

There were 25 pregnancies terminated following chorionic villus sampling because of an abnormal result (20) or for elective reasons (5). Of the 953 pregnancies "intended to continue," 22 were spontaneously aborted, representing an overall loss rate of 2.3 percent. The loss rate for transabdomi-

Figure . A uterus at 10-week gestation with catheter positioned in the chorion frondosum

nal CVS was 2.6 percent compared with the transcervical rate of 2.2 percent, a nonsignificant difference. Of the 78 procedures performed between 12 and 13 weeks menstrual age, only two losses occurred. This rate, likewise, is not different from the overall rate for spontaneous loss.

The incidence of nonmosaic chromosome abnormalities was 1.7 percent. Mosaicism was detected in 11 cases (1.1 percent), but in only three of these cases were the abnormalities confirmed, either on amniotic fluid cells or fetal tissue. This represents a true abnormality rate of 27.3 percent when a mosaic result is detected by CVS.

All 931 continued pregnancies have now delivered. Although ascertainment is still incomplete, only nine birth defects have been reported following CVS—a rate of 0.97 percent. No limb abnormalities have been observed following chorionic villus sampling.

Discussion

Chorionic villus sampling has gained wide acceptance over the last seven years, both at the University of Maryland and worldwide. From its beginning in the infancy of CVS development to the present, our program has grown to an average of ten patients per week undergoing CVS. Much of the technique's popularity can be traced to the earlier availability of results and the relatively painless nature of this procedure.

Other studies have shown the safety, efficacy, and accuracy of this diagnostic modality, and our results confirm those findings.^{1–4} More than 99 percent of patients will have successful sampling, most with only one pass of the catheter or needle. The total loss rate of 2.3 percent in this study is quite low and compares favorably with large programs and with those programs with a limited number of operators.^{6,7} Without a control group, it is impossible to calculate true procedure risks, but other studies have shown a background loss rate at this stage of pregnancy to be 2–3 percent.⁸ Therefore, it would

appear that in an experienced program, the loss rate directly attributable to the procedure approximates 0.5 percent or less, a rate quite comparable with amniocentesis.

Our results support previous studies indicating that CVS is not associated with an increased risk of birth defects. In addition, no limb abnormalities were seen following CVS, contrary to the concern raised in a recent report.⁹ We believe these differences relate to our strict guidelines for only sampling after nine menstrual weeks and to the experience of the operators in this program. It is likely that limb abnormalities, if observed, are related to earlier sampling (prior to nine weeks) and a transabdominal approach, factors that may result in significant disruption of the placental bed and/or marked uterine contractions.

In other studies, confined placental mosaicism has been noted to represent a diagnostic dilemma.^{3,4} In our experience, the incidence of this finding was 1.1 percent, but in only one-quarter of these patients did the result truly reflect the fetal chromosome constitution. In all patients with mosaicism, amniocentesis should be performed to confirm the observations. Most cases of mosaicism will be confined to the placenta and will not be found in the fetus. Our numbers are too small to address the question raised previously of poor obstetric outcome in patients with confined placental mosaicism, but no trend was noted.

In summary, the University of Maryland's experience with almost 1,000 cases confirms the safety and reliability of chorionic villus sampling. Our experience supports the concept that loss rates can be minimized even in programs where multiple (4) new operators are added to the program over the course of seven years. We believe our success is due to the requirement that all new operators become thoroughly experienced in the technique on pregnancies with planned elective termination. Integration into the clinical program is accomplished under the direct guidance and supervision of an experienced operator. Based on our data and that from the literature, we believe that CVS is a safe, accurate prenatal diagnostic method, offering patients the benefit of first-trimester diagnosis.

Acknowledgments

Our special thanks is given to the counseling efforts of Ms. Ann Jewell, Ms. Merry Ferré and Ms. Ann Roberson; the reliable ultrasonographic support of Ms. Cheryl Wilson; and the superb patient care provided by Drs. Neil Saller and Marshall St. Amant. Without their help, this study would have been impossible. ■

The above report illustrates two of the superb qualities that made John Dennis, M.D. an outstanding dean:

- He recognized programs that would improve health care for the citizens of Maryland and increase the scientific knowledge emanating from our institution; and
- he was a man of his word.

During the winter of 1981-82, Dr. Dennis was quite impressed with the proposal made by Maimon Cohen for developing a Division of Human Genetics in the Departments of Obstetrics and Gynecology and of Pediatrics. He quickly recognized the need for such a program and appreciated the uniqueness of it in that it was to be based in two departments vitally interested in human genetics.

When Dr. Dennis made a promise regarding the provision of resources necessary for faculty to do their job, he always kept that promise. In addition to supporting our efforts in genetics with resources from the School of Medicine, he convinced the hospital administration to invest some of their very scarce resources in this program. Both the School of Medicine and the hospital have been amply repaid for the financial investment by both institutions.

Generations of Marylanders will profit from John Dennis' foresight.

A NIGHT AT THE SENATOR

MOVIE & DESSERT EXTRAVAGANZA

★ Sponsored by the Young Physicians Committee of the Baltimore City Medical Society ★

Spend
an evening
with friends and
colleagues. See a fine
movie. Enjoy scrumptious desserts
by Harvey's of Greenspring Station,
supported by a grant from Albert Antlitz and
Charlie Tietelbaum, insurance and financial advisors.

Friday, June 12, 7:30 p.m.
Senator Theatre, York Road at Belvedere

Far and Away
A Ron Howard film starring Tom Cruise
\$10.00 per person

Proceeds will support the Young Physicians Committee's public service project to provide health care to the homeless. Space is limited. Make your check payable to BCMS Foundation, Inc. and send it in today.

Hemoglobin as oxygen carrier in cell-free fluids

Enrico Bucci, M.D., Ph.D. and Clara Fronticelli, Ph.D.

From the University of Maryland at Baltimore, Department of Biological Chemistry, where Dr. Bucci is professor and Dr. Fronticelli is professor.

The University of Maryland is studying the oxygen needs of internal organs and how these needs can be met by oxygen carriers in cell-free fluids. Once developed, cell-free oxygen carriers will have a large variety of applications including hemodiulution, transfusion therapy, organ preservation, and cancer therapy.

Blood transfusion is a major tool in health care delivery, and the demand for safe blood is continually increasing. It can be safely assumed that when a cell-free oxygen carrier becomes available, it will have a large variety of applications and provide the means for further development of new medical procedures. While it is presently impossible to reproduce a system that incorporates all the characteristics of whole blood, a red cell substitute would present several advantages, such as virus-free solutions, unlimited availability, and universal use. Obvious applications are hemodilution and transfusion therapy; others can be envisioned such as organ preservation, reperfusion of ischemic tissues, cell culture media, treatment of systemic anemias as in sickle cell disease or thalassemia, and cancer therapy. Many others will become obvious with usage of the new technology.

Historical background

The history of the development of blood substitutes goes *pari passu* with catastrophic events associated with loss of blood, such as wars and natural disasters. Early attempts to transfuse animals with homologous or heterologous blood were made in 1875 by Smith¹ after the carnage of the American Civil War. The occurrence of intravascular coagulation and nephrotoxicity was found to be linked to the lipids of the erythrocytes stroma. Research remained dormant until World War I broke out in Europe in 1914, reviving the urgent necessity for fluid replacement to save young lives. Successful attempts were made using either isotonic solutions of crystalloids² or solutions containing cell-free oncotic agents (i.e. plasma expanders) of various natures, including gum and dextrans.² The development of advanced technology for collection and utilization of blood and its fractions provided the clinician with a vast array of plasma expanders that could be used for resuscitation. These substitutes included starch and dextran solutions, solutions of serum albumin, and whole blood. The development of this technology allowed the standardization of new clinical and surgical techniques, including very complex procedures based on extracorporeal circulation.

The increasing demand for blood products revealed limitations such as a shortage of donated blood, short shelf life of blood, transmission of viral infections, and allergic reactions not anticipated by cross matching techniques. It became clear that it would be very useful to obtain a cell-free transfusion solution that would combine the characteristics of a plasma expander with the capacity to transport oxygen from the lungs to the tissues. In blood, hemoglobin is the oxygen carrier inside the erythrocytes; an isotonic solution containing cell-free hemoglobin would confer to an infusion fluid both oncotic pressure and oxygen transport.

One of the most prominent pioneers in the development of a hemoglobin-based oxygen carrier was Dr. William R. Amberson, chairman of the Department of Physiology of the University of Maryland Medical School. Dr. Amberson experimented extensively with the preparation and use of hemoglobin solutions in animals and in humans. He reported the use of red cell hemolysates in fourteen patients, seven of whom had repetitive infusions.³ He noticed that following transfusion, there was an elevation of blood pressure associated with a diminished heart rate; in most of the cases, the general condition of the patients improved and the hematocrit values were increased. Hemoglobin was retained in the circulation for a few hours, and a maximum of 25 percent was eliminated in the urine during a period of 30 hours. In some cases, oliguria was observed associated with a reduction of the glomerular filtration rate and renal plasma flow, with later recovery to normal. These effects were more evident in patients who received multiple infusions. Amberson attributed these effects to the presence of cellular debris from the erythrocyte membranes in the infusion solutions. He indicated the necessity of extensive careful investigations using standard preparations of hemoglobin solutions with the warning that "the field is a difficult one, beset with many hazards."³

Hemoglobin as cell-free oxygen carrier

Hemoglobin is a tetrameric protein formed by two pairs of α - and β -subunits. As shown in **Figure 1**, the tetrameric and dimeric forms are in equilibrium in oxygenated hemoglobin. When hemoglobin is inside the erythrocytes, the dimers are not released; however, in cell-free solutions, the dimers are rapidly filtered through the capillary walls and, in less than an hour, most of the infused hemoglobin disappears from plasma. A massive hemoglobinuria is produced and at least 30 percent of the infused material is recovered in the urine. **Figure 1** shows the dissociation of tetrameric hemoglobin followed by urine elimination.

Hemoglobin is the protein within the erythrocytes that transports oxygen from the lungs to the tissues. The oxygen affinity of hemoglobin in the red cells is controlled so that oxygen is absorbed at the lungs and re-

leased to the tissues. The affinity of hemoglobin for oxygen, P_{50} , is measured by the partial pressure of oxygen necessary for producing 50 percent saturation. **Figure 2** shows the oxygen-binding curve of whole blood as compared with that of a cell-free solution of hemoglobin. In both cases, the curve is sigmoidal, indicating heme-heme interaction. The P_{50} of whole blood is near 28 mmHg; the oxygen binding curve of cell-free hemoglobin is shifted toward the left and the P_{50} is near 15 mmHg. This implies that cell-free hemoglobin has a higher oxygen affinity, which would prevent the release of oxygen to the tissues. The difference in oxygen affinity between whole blood and hemoglobin is due to the presence, within the erythrocytes, of an organic polyphosphate, namely 2,3 diphosphoglycerate, which combines with hemoglobin,

Figure 1. Schematic representation of tetrameric hemoglobin which, inside the erythrocytes, combines with 2,3-diphosphoglycerate (2,3-DPG). In pure solution, it dissociates into dimers which, in turn, are eliminated in the urine. Crosslinked hemoglobin molecules do not dissociate into dimers and are retained by the kidney.

Figure 2. The figure shows oxygen-binding characteristics of whole blood and of pure hemoglobin. The figure also shows the fraction of bound oxygen that is delivered to the tissues by the two carriers. The delivery from pure hemoglobin is much less than from whole blood. Measurements were performed at 37° C at pH 7.4 in 10 mM phosphate buffer, 25 mM sodium bicarbonate, and 65 mM sodium chloride in the presence of carbon dioxide at the partial pressure of 40 mmHg.

thereby decreasing its oxygen affinity to a level that assures efficient oxygen transport. This interaction is lost in cell-free conditions.

It is clear that the use of hemoglobin in transfusion fluids requires manipulations for preventing its dissociation into dimers and for decreasing its oxygen affinity to physiologically acceptable levels.

Transformation of hemoglobin into a viable oxygen carrier

There is a vast literature on the attempts to transform hemoglobin into a viable oxygen carrier.⁴ As discussed, the main difficulties to be overcome in the design of hemoglobin-based oxygen carriers are: (a) the high oxygen affinity of cell-free solutions of hemoglobin; (b) the short retention time in circulation, resulting from the rapid filtration of the dimers through the endothelial walls of the capillaries, especially in the renal glomeruli; and (c) the complete removal of stromal residues which are toxic. To overcome these problems several approaches have been explored.

Chemical modifications. Chemical modifications are used to confer to hemoglobin an oxygen affinity similar to that of blood and to impede the dissociation into dimers. These modifications can be grouped into different categories for which only the most relevant literature is reported here.

1. Modifications that decrease the oxygen affinity such as carboxymethylation of the amino terminal residues⁵ and pyridoxylation of the β -subunits,⁶ and fumaryl-acylation of the lysines of the β -chains.⁷
2. In pseudo-crosslinked hemoglobins, the formation of dimers is inhibited by chemical modifications that produce extra hydrophobic and electrostatic bonds between hemoglobin subunits.^{8,9}
3. Intramolecularly crosslinked hemoglobins introduce a covalent crosslink between the α - or β -subunits.^{7,10} This modification totally prevents the dissociation of hemoglobin into dimers. As shown in Table 1, the introduction of these crosslinks, in some cases, also reduces the oxygen affinity of hemoglobin to a level similar to or lower than that of blood.

Table 1. Oxygen affinity characteristics of human and bovine hemoglobins treated with mono- and di-ester derivatives of 3,5-dibromosalicylate.

Compound #	Hemoglobin	Reagent	P ₅₀ (mmHg)	n
1	HbA	FBDA	11	2.0
2	HbBv	FBDA	17	1.8
3	HbA	FMDA	26	1.9
4	Hbv*	FBDA	27	2.3
5	HbBv	FMDA	38	1.8
6	HbBv	FBDA	45	1.9

Measurements performed at pH 7.4 in 0.1 M tris buffer with 0.1 M Cl⁻ at 37° C in the presence of 5 percent CO₂.

FMDA = Fumaryl-mono-DA HbA = Human hemoglobin Ao

FBDA = Fumaryl-bis-DA HbBv = Bovine hemoglobin

DA = 3,5-dibromosalicylate

n = Extent of heme-heme interaction (blood, n=2.8)

* = Obtained from deoxyhemoglobin

4. Intermolecularly crosslinked hemoglobins are polymeric hemoglobins of molecular weight (MW) between 100,000 and 1,000,000 (normal hemoglobin MW = 64,000). An advantage in the use of polymeric hemoglobins is their low oncotic pressure that allows their use in high concentration, increasing the oxygen-carrying capacity of the perfusion fluids.⁴ The crosslinkers used are nonspecific in their chemical reactions, resulting in random chemical substitutions which, in turn, produce largely heterogeneous materials, difficult to standardize and characterize.
5. Conjugated hemoglobins are hemoglobins coupled to large molecular weight matrixes like dextran, polyvinyl-pyrrolidone, and polyethylene glycol.⁴ These oxygen carriers are also heterogeneous and, due to the inert nature of the supporting matrix, the amount of oxygen transported per unit weight is uncertain.

Preparation of highly purified solutions of hemoglobin.

According to Amberson et al,³ conflicting results and claims on the efficacy and side effects of hemoglobin-saline solutions were due to the different preparative procedures used in different laboratories. This problem is still present. Modern technology offers a variety of means for purifying hemoglobin from hemolysates. These include filtration devices and centrifugation machines for large scale chromatography. Quality control tests enable investigators to analyze and evaluate the standardization of their preparations. Still, there is not a consensus on a common purification method that would allow better comparative evaluation of the various products. The high cost of these procedures is a severe limiting factor for animal experimentation, which requires large amounts of hemoglobin solutions.

Possible hemoglobin sources

The main source of human hemoglobin comes from outdated units of blood and this supply is limited. Concern for nondetectable viral infections is also high. A solution to this problem would be to use blood from other large mammals. The use of bovine Hb has been explored and a product is available commercially as cell culture media. Bovine hemoglobin is particularly suitable because in physiological conditions, it has an oxygen affinity similar to that of blood, even in cell-free conditions. Recent concerns about its use are due to the finding of the bovine spongiform encephalitis agent in European cows. This agent is thermostable and can remain dormant for many years.

Molecular biology has provided an alternative source of hemoglobin by introducing in microorganisms such as *E.coli*, expression vectors for human hemoglobin.¹¹ A company, Somatogen, claims it is starting industrial production of recombinant human hemoglobins. Unfortunately, these products are under proprietary custody and are not available for rigorous scientific evaluation.

Development of hemoglobin-based oxygen carriers at the University of Maryland.

Purification of hemoglobin samples. The University of

Maryland's acquisition of a large-scale preparative liquid chromatography apparatus allowed the standardization of procedures for obtaining chromatographically pure oxygen carriers in quantities sufficient for *in vivo* trials on rats, cats and dogs. It is a labor intensive technique that involves chromatographies, filtrations, isovolumetric dialyses, and detoxification steps. This technique assures reproducibility of the prepared oxygen carriers.

Chemical modifications of hemoglobin. The authors have developed a family of oxygen carriers based on the observation reported by Dr. Klotz at Northwestern University¹² that a derivative of aspirin, namely 3,5-dibromosalicylic acid, is a specific receptor group for the lysines at position 82 in the so called β -cleft of hemoglobin, where hemoglobin binds 2,3-DPG. The double ester of fumaric acid (COOH-CH=CH-COOH) with 3,5-dibromosalicylic acid produces a covalent crosslink between the β 82 residues of the partner β -subunits of hemoglobin, thereby preventing its dissociation into dimers (Figure 1). Fumaric acid can be replaced by a variety of polycarboxylic acids so as to obtain a group of reagents with high specificity for the β 82 residues of hemoglobin. These reagents have been used to prepare a large family of oxygen carriers with similar molecular and physico-chemical characteristics and with oxygen affinity between 10 and 50 mmHg. Sedimentation velocity measured in the analytical ultracentrifuge indicates that they behave as nondissociable tetramers. This anticipates longer retention time in circulation and decreased or null urine elimination after infusion into animals. The functional characteristics of these products are listed in Table 1. The range of oxygen affinity covered by this family of hemoglobin derivatives is graphically presented in Figure 3. The bold line is the oxygen binding curve of whole blood. For these studies, either human or bovine hemoglobins were used, with similar results.

Animal experimentation. There are many reports of altered renal function upon injection of natural hemoglobin or hemoglobin derivatives. These negative effects have been attributed to impurities present in the preparations used for infusion.^{3,4} In collaboration with Dr. Urbaitis in the Department of Medicine and Physiology,¹³ the authors have monitored the renal functions of rats infused with our chromatographically pure solutions of natural hemoglobin or of hemoglobin crosslinked between the β -subunits (compound 2 in Table 1). Hemoglobinuria was absent when the crosslinked derivative was injected; when solutions of natural hemoglobin were used, 30 percent of the infused material was recovered in the urine.

Urine flow (V), the glomerular filtration rate (GFR), and effective renal plasma flow (ERPF) were monitored. In all cases, including controls with injection of bovine serum albumin, we observed a transient increase in GFR, ERPF, and urine flow, suggesting that these alterations were produced by the 8 percent expansion of vascular volume consequent to the bolus injection.

Within 1 hour, these functions returned to normal values which were maintained after 48 hours. These data are shown in Table 2.

These results confirmed Amberson's expectation³ that the use of purified hemoglobin solutions prevents renal dysfunction and that the extensive hemoglobinuria occurring upon injection of unmodified hemoglobin does not produce lethal or irreversible kidney damage.

Molecular design of hemoglobin-based oxygen carriers by genetic engineering. The gene of the β -globin has been introduced in *E. coli*, and techniques of molecular biology can be used for introducing selected amino acid substitutions in the expressed protein. New mutant hemoglobins can be designed in which the functional characteristics can be tailored to specific needs. The authors are developing recombinant mutant human hemoglobins whose oxygen affinity will be regulated by anions physiologically present in plasma-like Cl^- and HCO_3^- . These will produce oxygen carriers whose oxygen affinity is modulated by the metabolic needs of the infused organism and by possible clinical interventions.

Conclusion

An institutional program for conducting systematic experiments leading to a better understanding of the oxygen needs of internal organs and how these needs can be met by oxygen

Table 2. Renal function data 48 hours after 60 to 100 mg per 100 gm⁻¹ albumin, HbA, and HbBvFBDA.

	Dose (mg/ 100 gm)	n	V ($\mu\text{l/min}$)	GFR ($\mu\text{l/min}$)	ERPF ($\mu\text{l/min}/$ 100 gm)
Albumin	100	4	3.5 ± 0.2	449 ± 24	1168 ± 98
HbA	60	5	3.5 ± 0.1	451 ± 50	1317 ± 144
HbA	100	6	3.9 ± 0.1	385 ± 57	1095 ± 199
HbBvFBDA	100	2	3.2 ± 0.2	489 ± 40	1329 ± 219

V = urine flow
ERPF = effective renal plasma flow
HbBv = bovine hemoglobin
GFR = glomerular filtration rate
HbA = human hemoglobin Ao
FBDA = fumaryl-bis-DA

Figure 3. Representative oxygen-binding curves of the oxygen carriers listed in Table 1, compared with that of whole blood (thick line). Measurements were performed as described for Figure 2.

carriers in cell-free fluids is developing at the University of Maryland. The program is multidisciplinary, spanning from the physical chemistry of hemoglobin molecules to the physiology of oxygen transport in normal and hypoxic animals. The efforts involve the expertise of physical chemists, biochemists, molecular biologists, surgeons, anesthesiologists, and physiologists.

At present, the availability of a variety of chromatographically pure oxygen carriers, retained by the kidney and with reduced or null toxicity is a facility unique to the University of Maryland. If our efforts are successful, it will give the University of Maryland national prominence in the field of hemoglobin-based oxygen carriers.

A new concept of hemorrhagic shock: Implications for therapy

Donald S. Gann, M.D. and John A. Evans, Ph.D.

Dr. Gann is professor and associate chairman, Department of Surgery, University of Maryland School of Medicine. Dr. Evans is assistant professor, Departments of Surgery and Biological Chemistry, University of Maryland.

Although historically shock has been viewed in terms of circulatory failure, in recent times, the defect in shock has been thought to result from a failure of oxygen delivery.

Although historically shock has been viewed in terms of circulatory failure, in recent times, the defect in shock has been thought to result from a failure of oxygen delivery. Thus, in hemorrhagic shock, as a result of decreased venous return, cardiac output falls and, consequently, the delivery of oxygen to tissues does as well. With the finding by Shires and his colleagues in the 1970s that membrane depolarization (a decrease in the absolute value of the transmembrane potential) is a constant finding in shock,¹ a modern view of the pathogenesis of shock has been developed. According to this view, as oxygen delivery fails, cells are unable to generate sufficient quantities of ATP (adenosine triphosphate). As a result, the electrogenic sodium pump, mediated by the hydrolysis of ATP by the sodium- and potassium-dependent ATPase (adenosine triphosphatase), fails; the membrane depolarizes; and sodium and water accumulate within the cell as potassium is lost from it.² The cell swells, leading to further derangements in cellular function. Membrane depolarization has been observed in septic shock as well as in hemorrhagic shock, and these events have been thought to provide the linkage between circulatory failure, identified as critical by early workers in the field of shock, and cellular and organ dysfunction, identified more recently.

Several lines of evidence have developed that appear incompatible with the views summarized above. First, membrane depolarization has been observed after levels of hemorrhage that should not severely limit oxygen delivery or, consequently, ATP formation.³ Second, membrane depolarization has been observed in sepsis before the onset of hemodynamic destabilization and the onset of true septic shock.⁴ Third, and most significant, the red blood cell has been found to exhibit membrane depolarization, both in hemorrhagic and in septic shock.^{4,5} The red blood cell synthesizes ATP as a result of glycolysis, a process independent of oxygen consumption. Indeed, although the red blood cell carries oxygen, it does not consume it, but rather uses glucose as its fuel. Glucose is readily available to the red blood cell, and this availability is not limited in shock.

It is also apparent that the red blood cell possesses neither a microcirculation nor innervation. These various lines of evidence led to the consideration of the possibility that there might be a humoral factor circulating in shock that might somehow mediate depolarization of the cell membrane.⁶

If the magnitude of hemorrhage is not too great, blood volume lost by hemorrhage is restored by physiologic processes that depend upon the neural and hormonal responses to hemorrhage.⁷ Full restitution of blood volume after hemorrhage depends on the movement of fluid from cells into the extracellular and extravascular interstitium and, subsequently, the movement of water and protein into the vascular compartment.⁸ The movement of fluid out of cells is driven by a transient osmotic gradient that is generated by the production of solute from the liver in response to the elevation of a number of hormones triggered by hemorrhage, including cortisol, the catecholamines, vasopressin, and glucagon. The failure of any of these hormones to rise after hemorrhage can limit the degree of restitution of blood volume and protein. On the other hand, we have found that as the magnitude of hemorrhage increases, there is a critical point reached at approximately 25 percent of the blood volume beyond which larger hemorrhage does not lead to full restitution of blood volume.⁹ This is the same magnitude of hemorrhage at which Shires and his colleagues have found the onset of membrane depolarization.¹⁰ We have examined this situation quantitatively in our own laboratory and have found that the degree of water and salt movement into cells, as a result of membrane depolarization, can account precisely for the failure of restitution of blood volume after large hemorrhage. Indeed, the amount of membrane depolarization required to produce the degree of cell swelling that would offset the physiologic restitution is precisely that measured previously by Shires and his colleagues.

Stimulated by this finding and by the evidence summarized above that suggested a humoral factor, we have sought evidence for the presence of such a factor in hemorrhagic shock. We chose to study the plasma of rats subjected to hemorrhage in the absence of anesthesia or surgical manipulation. The rats were subjected to hemorrhage at five days after cannulation of the aorta and vena cava, following which they were allowed to readapt to their cages, eat and drink freely, and move about the cage without restraint. We found that within a few minutes after the onset of a major hemorrhage, a factor appeared in rat plasma that could depolarize cells. The amount of this factor continued to rise after hemorrhage of 30 percent of the blood volume, reaching a peak at twenty minutes which was sustained for the duration of the experiment. The factor was restrained by a dialysis membrane that indicated its molecular weight to be in excess of 10,000 daltons. In the process of this dialysis, plasma was equilibrated with buffer to ensure constant pH and ionic composition. Exposure of a variety of cells to very small amounts of dialyzed plasma for short periods of time led to depolarization, measured by a voltage sensitive dye.¹¹ The methods that we employed avoided possible arti-

facts generated from the puncture of cells by microelectrodes, and gave independent confirmation of the degree of depolarization of membrane identified by the Shires group.¹⁰ The dialyzed rat plasma depolarized red cells, white cells, smooth muscle cells, striated muscle cells, and kidney, liver, and adrenal cells of the rat, and also depolarized cells derived from mice, cats, dogs, pigs, and human beings. These results indicated a lack of dependence of either cell type or species. The finding that red cells depolarized was of particular interest since this result was consistent with the findings in red cells in hemorrhagic and septic shock. Furthermore, the various cell lines were not deprived of oxygen, indicating that hypoxia in the target cell was not required for membrane depolarization. Hypoxia, however, might be important in mediating production of the factor. We examined the binding kinetics of the factor to cells and demonstrated equilibrium kinetics indicative of binding of the factor to a membrane receptor.¹¹

Because the measurement of membrane potential might be the result of some methodological artifact, we have sought independent confirmation of membrane depolarization by other methods. These alternative approaches have confirmed depolarization of cell membranes and have permitted identification of the active substance as a high molecular weight protein.

These findings provide a new avenue for the study of shock and trauma, and also suggest a possible approach to therapy. Because the factor is a protein, it is possible that monoclonal antibodies to it may interfere with its action and may offer a therapeutic intervention analogous to that currently being attempted with antibodies to endotoxin or to tumor necrosis factor. Alternatively, the demonstration that the factor acts through binding to a membrane receptor offers the possibility of developing a specific receptor blocker that may interfere with its action. However, the ubiquitous distribution of the factor and of receptors for it raises the possibility that this as yet unidentified substance may play an essential role in normal human physiology, precluding the desirability of total blockade. Clearly, more work is required to provide precise identification of the factor, to elucidate its mechanism of action and modes of control, to examine its production in a variety of forms of shock, and to demonstrate the effect of blocking its action. Nevertheless, the findings at the present offer a novel view of shock as humorally mediated and account for a number of previously uninterpretable findings in hemorrhagic and in septic shock.

RADIOLOGISTS:

EXPERIENCE THE ADDED PRESTIGE IN THE ARMY RESERVE.

There's something extra that radiologists get when they work part-time with the Army Reserve. It's the prestige of being an Army officer.

Reserve radiologists also have the opportunity to work with top, dedicated professionals from all over the country. There are also opportunities to attend conferences and even to continue advanced education.

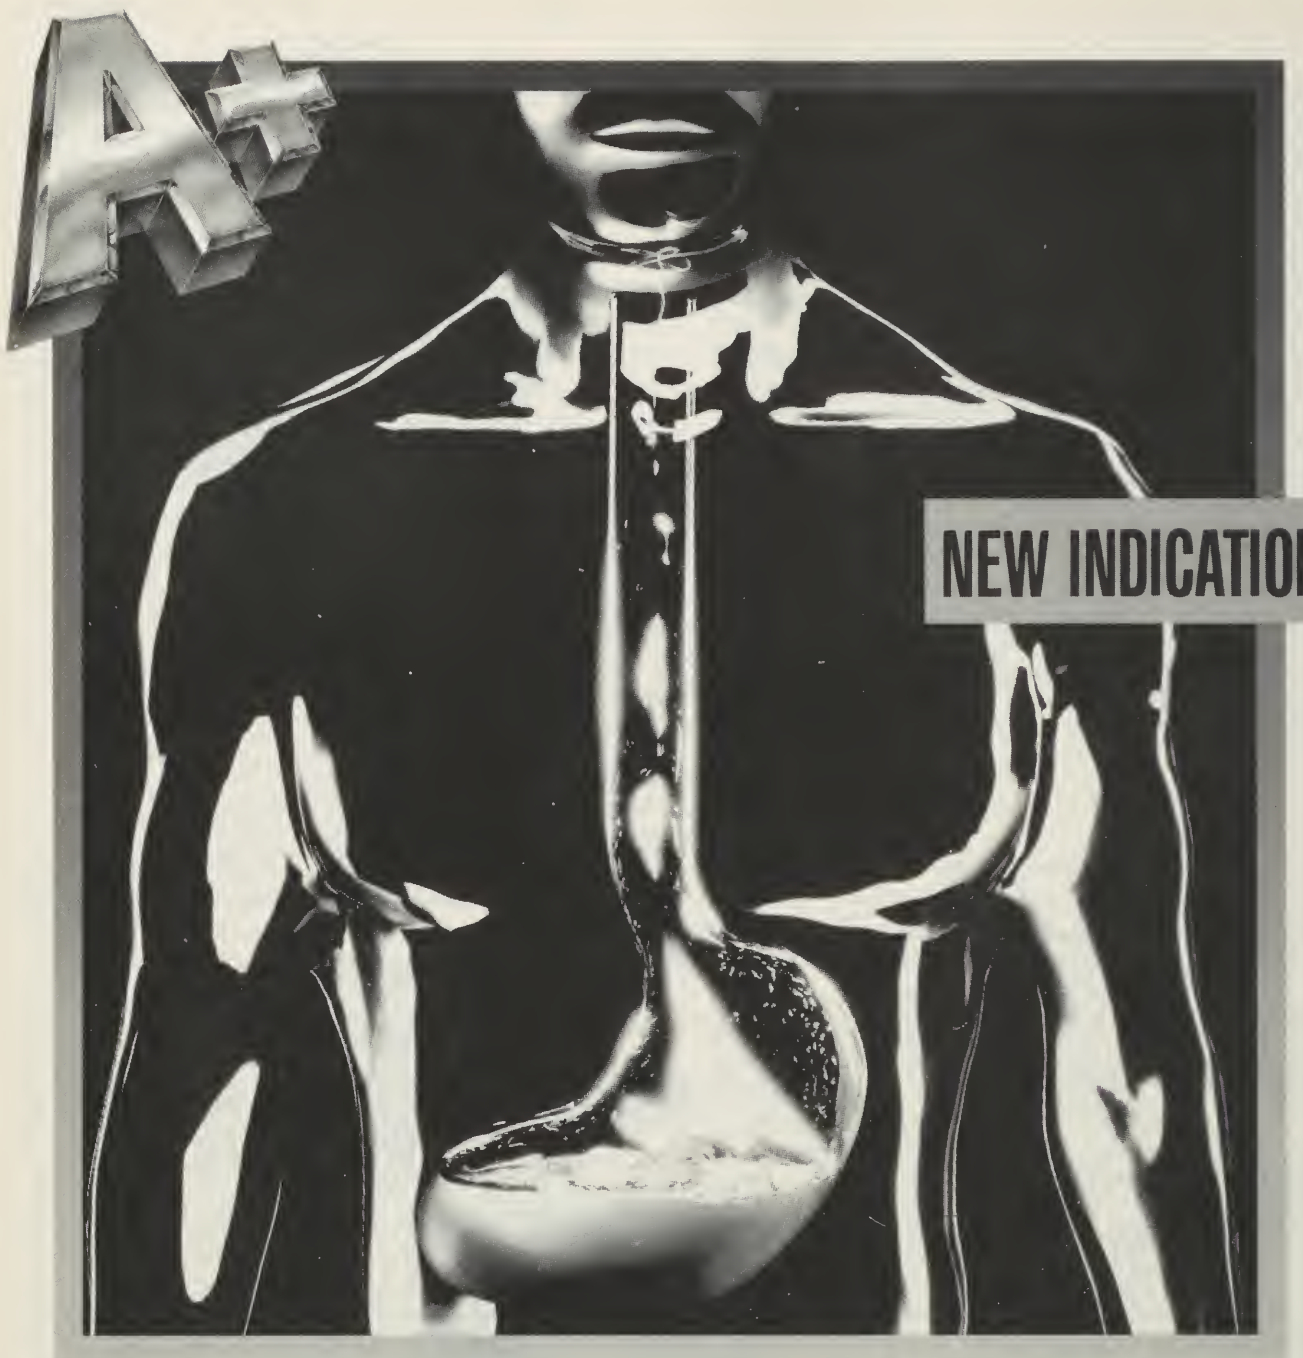

We know your time is valuable, so we can be very flexible about how and when you participate.

If you're looking for new challenges and increased prestige, the Army Reserve is worth your consideration. For more information about Army Reserve medicine, contact one of our experienced Army Reserve Medical Counselors. They can arrange for you to talk to an Army Reserve physician and visit a Reserve Center or medical facility. Call collect: 410-997-3526

**BE ALL YOU CAN BE.®
ARMY RESERVE**

A#

NEW INDICATION

ONLY ONE H₂-ANTAGONIST HEALS REFLUX ESOPHAGITIS AT DUODENAL ULCER DOSAGE. ONLY ONE.

Of all the H₂-receptor antagonists, only Axid heals and relieves reflux esophagitis at its standard duodenal ulcer dosage. Axid, **150** mg b.i.d., relieves heartburn in **86%** of patients after one day and **93%** after one week.¹

AXID[®]
nizatidine
150 mg b.i.d.

ACID TESTED. PATIENT PROVEN.

AXID[®]

nizatidine capsules

Brief Summary. Consult the package insert for complete prescribing information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to 8 weeks of treatment at a dosage of 300 mg h.s. or 150 mg b.i.d. Most patients heal within 4 weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a dosage of 150 mg h.s. at bedtime. The consequences of therapy with Axid for longer than 1 year are not known.

3. *Gastroesophageal reflux disease (GERD)*—for up to 12 weeks of treatment of endoscopically diagnosed esophagitis, including erosive and ulcerative esophagitis, and associated heartburn at a dosage of 150 mg b.i.d.

Contraindication: Known hypersensitivity to the drug. Because cross sensitivity in this class of compounds has been observed, H₂-receptor antagonists, including Axid, should not be administered to patients with a history of hypersensitivity to other H₂-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix[®] may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chloridazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A 2-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a 2-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.
